NEWELL, Peter ("SHEAF HERSEY"), American illustrator and humorist: b. McDonough Co., Ill., 5 March 1862; d. 15 Jan. 1924. He was educated at Bushnell, Ill., worked for a photographer, drew crayon portraits, studied in New York at the Art Students' League and in the early 90's became famous for his whimsical illustrations to humorous books and for his own pictures with text, which appeared in various periodicals and were collected as 'Tonys and Turvys' (1893-94), 'Peter Newell's Pictures and Rhymes' (1899), etc. His later work with its striking use of flat tones, possibly traceable to Japanese influence, is to be seen in the illustrations to Lewis Carroll's 'Alice in Wonderland,' 'Alice in the Looking-Glass,' 'The Hunting of the Snark,' 'Mr.

Munchausen,' 'Book of Clever Beasts,' etc. His more recent publications are 'The Hole Book' (1908); 'Jungle Jangle' (1909); 'The Slant Book' (1910); 'The Rocket Book' (1912).

NEWELL, Robert Henry, American humorist, whose pseudonym was "ORPHEUS C. KERR," that is "Office Seeker": b. New York, 13 Dec. 1836; d. Brooklyn, 1 July 1901. He was educated in New York; became assistant editor of the *Sunday Mercury* in 1859; for it wrote his first 'Orpheus C. Kerr Papers,' which were continued in three volumes (1861-64), none possessing much deeper humor than the kind suggested by the title. He was a war correspondent of the *New York Herald*; acted as an editor of the *New York World*, then of the *Daily Graphic*, and later of the *Hearth and Home*, which he left in 1876. In 1878 he began to suffer with writer's cramp and letter-blindness, from which he never recovered. Besides his humorous sketches Newell wrote 'There Was Once a Man,' an anti-Darwinian romance (1884); 'Avery Glibun' (1867); 'The Palace Beautiful' (1865), and 'Versatilities' (1871), both volumes of verse; 'The Cloven Foot,' an adaptation of 'Edwin Drood' (1870), and 'The Walking Doll,' a novel of New York life (1872).

NEWFOUNDLAND, The Atlantic Fisheries Dispute. This fertile source of friction between the United States and Great Britain antedates the War of Independence. In those times the American colonists, as fellow-subjects of England, prosecuted the fisheries of the Grand Banks and Saint Lawrence Gulf on equal terms with the inhabitants of Canada and Newfoundland. During the Revolution the Americans could not exercise it, but by the Treaty of 1783 they regained this liberty. The War of 1812 abrogated it again and seizures of their vessels for attempting to prosecute the industry brought about the Convention of 1818, which fixes the status of the question at present.

The agreement of 1818, known in diplomacy as the Convention of Ghent, is somewhat remarkable. The American commissioners claimed that they still possessed the privileges formerly enjoyed by them as British colonists although war had intervened and they had become an independent nation. The audacity of the claim startled the English government, who answered that it was preposterous. The Americans were bold and insistent, they had many friends,—and as every one desired peace and harmony the convention finally agreed on a compromise on the question. The British government were ignorant both of the geography and the trade of Newfoundland, and they considered the fishing rights they were giving away as practically valueless.

By this treaty the United States abandoned all claims to fishing within the territorial waters of the British North American possessions elsewhere, in return for the right to catch fish inshore on the southwest coast of Newfoundland, between Ramea Isles and Cape Ray; on the west coast, between Cape Ray and Quirpon Isles; on the coast of Labrador, from Mont Joli, opposite Anticosti, eastward and northward indefinitely; and on the shores of the Magdalen Islands, with the further privilege of landing to dry and cure their catch on the un-

settled portions of the southwest coast of Newfoundland and along Labrador.

Differences as to the extent of the territorial jurisdiction and the interpretation of the treaty made the question one of serious menace to Anglo-American amity, owing to the vigorous stand taken by Canada (including Newfoundland) against the American fishermen, until 1854, when by a reciprocity treaty the Canadian fishery products were granted free entry into the United States. This accord was abrogated by Congress in 1866, the Convention of 1818 being reverted to. At once friction revived, and in 1871 it became necessary to conclude the "Washington Treaty," which embraced a series of articles dealing with the fishery problem. These provided for reciprocal fishing concessions in Canadian waters, and in American waters north of lat. 36°, but as Canada claimed that America secured the more valuable privileges an arbitration to dispose of this point was agreed upon. The fishery articles became operative 1 July 1873, the arbitration was held at Halifax (Nova Scotia) in 1877, and the tribunal, presided over by M. De la Fosse, Belgian Minister at Washington, awarded Canada \$5,500,000, of which \$1,000,000 went to Newfoundland. Congress abrogated the "fishery articles" in 1885, and again the Convention of 1818 governed this entanglement with the result of further trouble, so that in 1888 another fishery treaty, on similar lines to its predecessors, was arranged between the plenipotentiaries, Secretary Bayard and Mr. Chamberlain, only to be rejected by the United States Senate.

At this point Newfoundland and Canada parted company, so far as their attitude toward the United States was concerned. A *modus vivendi* for two years, to admit of the treaty being adequately considered by the Senate, had been arranged between the high contracting parties, granting American fisher-vessels, on payment of a license of \$1.50 per ship-ton, the right to enter the non-treaty waters of Canada and Newfoundland to purchase bait, ice, stores, and outfits; to transship cargoes and to hire men. When the treaty was rejected Newfoundland saw that fishery reciprocity between the United States and Canada was hopeless, and offered the former an accord on her own behalf. The proposal was accepted in 1891, when Secretary Blaine and Colonial Secretary (subsequently Premier) Bond drafted the Bond-Blaine Convention, providing privileges for American fishermen in Newfoundland waters in return for free entry of Newfoundland fish into American markets.

When it was ready for ratification, Canada protested against it, claiming that Newfoundland should not be allowed to make such a compact without including the dominion, and the British government, to avert a collision between the greater colony and the smaller, pigeon-holed this draft till Canada should have had an opportunity to effect a similar understanding. But this she could not do, though the Conservative and Liberal cabinets both sought terms from Washington, and as neither Canada nor Newfoundland dared abrogate the *modus vivendi* while hoping for a solution of the deadlock the temporary arrangement continued year after year. In 1902 Canada withdrew her protest and Sir Robert Bond revived the moribund draft

with Secretary Hay, the new one being known as the Bond-Hay Treaty, and containing improvements suggested by 12 years of discussion.

In 1904 the United States Senate "amended this to death," at the instance of the New England fishery interests, and then Newfoundland resolved to cancel the *modus vivendi*. This her legislature did by an enactment in April 1905 excluding all American fishing vessels from her non-treaty waters, save for wood, water, shelter or repairs, privileges conceded by the Convention of 1818; and, as regards her treaty waters, restricting them to the mere rights that compact assured to them. The first effect was to hamper them in securing bait for their deep-sea fishing, for which Newfoundland is the natural base, because of its proximity to these shoals. The second was to partially destroy the winter herring fishery on the west coast. Here they have treaty rights, but these are not ample enough to enable them to prosecute this industry successfully, as they need large numbers of coastfolk for netting and the use of the strand for salting or freezing the fish, and the residents were forbidden to work for, or sell to them; it being usual for the Americans previously, with the approval of the colonial government, to buy whole cargoes from the settlers who caught the fish. The withdrawal of these privileges seriously hampered the Americans and lessened their catch. They would, indeed, have fared even worse but that they succeeded in evading the colonial laws by inducing the coastfolk to proceed outside the three-mile limit and hire on board their ships there, returning then into territorial waters and serving as members of their crews.

This claim of the Americans to ship Newfoundlanders outside the three-mile limit and then return with them into port as legally part of their crew was not confirmed at Washington. The State Department discountenanced it and instructed the American fishermen that they only bring into Newfoundland waters crews shipped in American ports.

Newfoundland, early in 1906, passed a further act making it illegal for any of her people to leave her waters for such a purpose, or for any foreign fishing vessel to enter her waters with such men on board, while the Americans were also required to pay light dues, observe colonial fishery regulations, and enter and clear at the custom-houses, which obligations they had declined to subscribe to since the rupture. On one of these questions, the claim of the Newfoundland government to compel all American vessels to enter and clear at the Custom House is unanswerable. All nations have an inherent right to protect their revenues from smuggling. The supply of goods aboard their schooners known as "the slop chest" is solely for this purpose. Canada has always compelled them to enter and clear their vessels when visiting Dominion ports, and Newfoundland claimed the same right. The United States government did not uphold its fishermen on this point. The payment of light dues rests upon the same basis. The most contentious question was, how far are the Americans bound to obey local fishery laws? Where these regulations are general and simply for the protection of the species from destruction, it would seem reasonable that they should be obeyed. One point on which

there was some friction was the right of the Americans to fish on Sunday. This irritated the Newfoundlanders more than anything else and caused the trouble years ago known as "the Fortune Bay Outrage." As grave international problems were involved in the whole question, the British and American governments opened negotiations for an adjustment of it, appeal being made to The Hague Tribunal and the decision was not reached until 7 Sept. 1910, and in July 1912 a supplementary treaty was concluded giving binding effect to those parts of the award which were in the nature of recommendations only.

Taken altogether the award was a victory for the United States. Neither British imperial nor colonial authorities can compel American fishermen to report to the custom houses, nor can they impose upon these fishermen light, harbor or other dues. Hereafter American fishermen can employ Newfoundlanders on their vessels and they will also have the right to purchase supplies and enjoy other commercial privileges in Canadian ports. It was also specified by the tribunal that future disputes regarding fisheries regulations shall be adjusted by an impartial commission selected for that purpose.

Hon. Elihu Root was the chief pleader for the United States at The Hague, while Sir William Robson appeared for Great Britain.

P. T. McGRATH,

Editor (*The Evening Herald*), Saint Johns, N. F.

NEWFOUNDLAND. Geography.—Newfoundland, the tenth largest island in the world, is situated on the east coast of North America, between lat. 46° 37' and 51° 39' N. and long. 52° 35' and 59° 25' W. It occupies much the same geographical position in the New World as the British Isles do in the Old. The colony lies generally in a more southern latitude than the British Isles. It is larger than Ireland, containing 42,734 square miles. It is divided from the continent on the southwest by Cabot Straits, about 60 miles wide, and on the northeast by the Straits of Belle Isle, 10 miles wide. It juts far out into the Atlantic and is the nearest American land to Europe, being only 1,640 miles from Ireland and 1,213 from New York. Labrador, from Hudson's Strait to Blanc Sablon, including the basin of the Hamilton, is included in the Dominion, the remainder of the Labrador Peninsula forming part of the Dominion of Canada. Area, 120,000 square miles with a coast line of about 600 miles facing Newfoundland.

Topographical Features.—On the east coast the land is high and looks very rocky and barren; on the west coast the character of the country changes completely after Cape Ray is passed. Instead of the stern, forbidding mountainous aspect of the east and south coast the land is level, well timbered and fertile. An American artist has declared that the scenery of Bay of Islands on the Newfoundland west coast is the most picturesque in North America. The numerous river valleys are very beautiful, especially the Humber, Codroy, etc. Much of the interior is moorland and marsh, well wooded around the numerous lakes and rivers. Most of the good land lies in these alluvial valleys. The west has a finer climate and the land

generally is superior to the soil of the eastern shore. In the interior there are many isolated peaks. The chain of mountains known as the Long Range extends from Cape Ray for about 100 miles into the interior. There is another high range of mountains near the centre of the island. The highest peak is a little over 2,000 feet. The Atlantic coast line of Newfoundland and the southern shore have noble inlets, bays and harbors, admirably adapted for carrying on its great industry, the cod fishery.

Hydrography.—The peculiar feature of Newfoundland are the innumerable lakes, only two of which are large, Grand Lake and Red Indian Lake. Both are long and narrow, Grand Lake about 60 miles long and Red Indian Lake about 50; but neither is over 10 miles wide in any part. Glover Island in Grand Lake is 52 miles long. The largest river in the island is the Exploits, which is navigable for about 50 miles from the mouth of its estuary. The Humber, Gander, Codroys and Terra Nova rivers are all fine streams, but of no value for navigation except by canoes.

Soil.—In many parts of the island there is very good land, especially in the Codroy Valley, Saint George's Bay and the Humber Valley. Deer Lake, Red Indian, Exploits Arm and the River Valley also contain good soil. Fine timber and good ground fit for cultivation surround both the Gander River and Lake. There is also good agricultural land around Avalon Peninsula. Trinity Bay, S. W. Arm, Green Bay, Notre Dame Bay, some parts of White Bay, Mortier, Placentia, Bonavista and Saint Mary's Bays. There are thousands of acres of splendid grazing ground and fine pasture lands specially suitable for sheep.

Minerals.—Newfoundland is celebrated as a producer of copper and iron, copper from the well-known Tilt Cove mine and iron from Bell Island. Iron of various kinds has been found in the north. The iron output in a recent year amounted to 656,000 tons. Argentiferous galena occurs in Placentia Bay. Asbestos is common and mica. Gold is being worked on a small scale in White Bay and petroleum of excellent quality is now being pumped at Parsons' Pond on the west coast. Slate and marble are abundant. A large deposit of talc has been opened and an aerial tramway built to it near Manuels Conception Bay. The country is almost wholly unexplored and her great mineral treasures, especially her valuable coal deposits, have not yet been tested in an efficient way with the boring machine. They are an extension of the Cape Breton coal fields and extend nearly across the island from Codroy to Green Bay. The annual mineral production is about \$3,000,000 in value.

Climate.—The Summer climate of Newfoundland from June until October is delightful. There is plenty of sunshine but no extremes of heat, seldom higher than 70° in the shade. The winter climate is not so severe as in Canada. Zero is only occasionally touched. The spring is late and the weather variable, due to the influence of the Labrador current which brings along the ice. During the last few decades the climate has improved and there is now no very heavy snowfall or intense frost before the end of November. The fog lies on the coast and only rarely comes in on the land.

Animal Life.—Newfoundland is the home of the woodland caribou. All the interior is one vast deer park where countless thousands of these fine animals range unmolested and unseen by man. Black bears, the grey wolf, now very scarce, the lynx, foxes, beavers and otters are indigenous. The varying hare has been introduced and now swarm all over the island. The Arctic hare is a native as well as the willow grouse and ptarmigan. There are plenty of snipe, ducks and geese, but no woodcock. The rivers abound with salmon and trout; there are no predaceous fishes, such as pike or pickerel.

Agriculture.—The main business of the colony is the fishery. Agriculture is only an auxiliary, and is mainly confined to the coast. The chief crops are oats, potatoes and turnips. There are 231,359 acres under cultivation or in pasture. About 541,000 bushels of potatoes; 11,000 bushels of oats; 65,298 bushels of turnips represent an average year's product. There are about 13,288 horses; 40,000 head of cattle; 100,000 sheep and 30,000 pigs. About \$600,000 worth of agricultural product is imported into the colony every year from the United States and Canada, all of which could be raised in the island. The farming around the capital is excellent. On the west coast, where the very best land is situated, is still very primitive. Before the outbreak of the war the total value of all the agricultural produce raised on the island was about \$2,000,000. This has been greatly increased by enhanced prices and more and better cultivation under the stern necessities of war.

Lumbering.—This industry has been greatly increased by capitalists from Canada and New England. The chief woods are spruce, white and yellow pine, red pine, fir, juniper, birch, witch hazel, aspen and white maple. There are now in operation several paper and pulp mills producing about 100 tons of paper and 250 tons of pulp daily, most of which is exported to England.

Fisheries.—The great industry of Newfoundland is the fishery. The Grand Bank fishery has declined of late but its loss has been made good by the increase of the fishery in coastal waters and along the Labrador Coast. Under the terms of the Anglo-French Convention of 1904 France renounced her exclusive fishing rights under the Treaty of Utrecht, but retained the right to fish in territorial waters from Saint John's Cape north to Cape Ray. In 1909 the Newfoundland fisheries disputes were submitted to The Hague and the award, given in 1910, secured the right of Great Britain to make regulations without the consent of the United States, subject to any limitations imposed by treaty. In the Grand Bank cod fishery in 1914, there were engaged 1,892 men and 105 Newfoundland sailing vessels, aggregating 7,790 net tons. The catch totaled 124,067 quintals of dry fish, valued at \$775,418. The coastal-waters cod fishery for the same year engaged 15,823 small sail vessels, motor boats, etc., and 48,221 men. The catch aggregated 1,032,198 quintals of dry fish, valued at \$6,193,188. On the Labrador fishery over 800 vessels and 5,500 men were engaged. The exports of codfish, including the Labrador fishery, aggregated 1,247,314 quintals. The lobster catch was 11,017 cases in 1914 and 6,022 cases in the year following. In the year 1914 there were eight vessels en-

gaged in whaling. The catch included 142 finbacks, 13 humpbacks; one sperm and five sulphur bottoms, a total of 161 whales, valued at \$85,008. The factories connected with the whaling industry turned out 150,146 gallons of oil, 256 tons of guano and over 80 tons of bone in 1914. The seal fishery in the same year yielded 233,719 seals, but fell to 47,004 in 1915. About 20 steam vessels and 4,000 men were formerly engaged in sealing. Sealing is now restricted by law to one month (16 March–16 April). The total value of all fisheries averages \$10,000,000 annually but in 1917 reached the unprecedented value of \$14,258,555. The codfishery, both in extent of area and in production, is the largest in the world. The most remarkable feature in this great industry is its stability and uniform success. As certain as seed time and harvest there come every year to the shores of Newfoundland the regular supply of the bait fishes in orderly sequence, herring, caplin and squid, and the voracious cod. The seal fishery is much more variable, some years being a complete failure, other years a great success. The industry was formerly prosecuted in sailing vessels, now it is carried on in 23 steamers. In 1918 a cold storage plant was erected for chilling fish, with a capacity of 200,000 pounds per day. During the year the chilled product of this plant was exported to England and fetched handsome prices.

The herring fishery is another large industry. The movements of the fish are sometimes very irregular and the year's catches variable, unlike the steady uniformity of the codfishery which has continued for over four centuries steadily productive. The Labrador herring, once so famous, is now a thing of the past. Owing to judicious protection, salmon are year by year increasing and every season an increasing number of anglers come to enjoy the sport, principally from the United States. See NEWFOUNDLAND, THE FRENCH SHORE QUESTION IN.

Manufactures.—Ship building is extensively carried on in the outports of the colony. There are also a very large number of saw mills, some very small and primitive, others on a large scale with all the best and most modern appliances. Nearly all the other manufactures are carried on at the capital, Saint Johns (q.v.). Paper-making has been inaugurated on a large scale and bids fair to have an annual output worth \$10,000,000.

Trade and Commerce.—The main import trade is done with Great Britain, United States and Canada. Imports in 1914-15 were valued at \$12,693,860; in 1913-14 they were valued at \$15,609,990, comprising textiles, \$1,852,968; flour, \$1,823,551; coal, \$1,066,762; hardware, \$901,756; salt pork, \$753,309; machinery, \$729,225; tea, \$224,382; molasses, \$208,949. The exports in the same year (1914-15) were valued at \$13,501,795 against \$15,549,185 in 1913-14, when there were exported dried cod to the value of \$8,071,899; pulp and paper, \$2,168,164; iron ore, etc., \$1,370,375; herring, \$469,546; seal oil, \$409,060; cod oil, \$386,825; seal skins, \$350,794; canned lobsters, \$347,941. Of the total imports (\$15,549,185) in 1913-14, merchandise to the value of \$3,826,529 came from the United Kingdom, \$5,192,462 from British possessions (mainly Canada) and \$5,796,906 from the United States. Exports to the value of \$3,256,446 were sent to the United Kingdom, \$2,522,159

to British possessions (mainly Canada), \$1,679,362 to the United States and \$7,676,606 to other countries. Imports from the United Kingdom in 1916-17 were valued at \$2,620,033, from the United States, \$10,233,899, and from Canada \$7,412,360. Trade with England is decreasing, whilst business with the States and Canada is on the increase.

The cause of this change is not far to seek. Whilst British capital has neglected Newfoundland, Canadians and Americans have been prompt to secure the advantages offered by the island's minerals and timber. They have realized that there are great possibilities in the colony. The exports of Newfoundland (1916-17, \$22,381,762) go principally to the United Kingdom, United States, Portugal, Brazil, Spain, Italy and Canada, chiefly dry codfish. Sealskins and oils go to the United States, England, and in small amounts to Canada. The iron ore goes to Canada, copper to England and iron pyrites to the United States. Trade is steadily increasing and the country is very prosperous.

The Revenue of the colony is nearly all derived from the customs and is considerably in excess of the expenditure. In 1913-14 and in 1914-15, however, the expenditures exceeded the revenues. In the first-named fiscal year the revenue was \$3,718,840 against \$4,029,070 for expenditure and in the following \$4,059,145 revenue against \$4,119,975 for expenditures. Customs receipts for 1916-17 amounted to \$4,470,537, and the total revenue was \$5,206,647; expenditures amounted to \$4,554,890. The public debt amounted in 1915 to \$32,328,415, principally incurred for railway construction and public works, and includes the municipal debt of Saint John's.

Means of Communication.—There are steamers running along the coast north and south. There are excellent main and branch roads. With some of the northern outports and Labrador, communication in winter is maintained with difficulty by couriers. With the outside world, England, the United States and Canada there are several lines of steamers. There are in operation 828 miles of government railway line with a gauge of three feet six inches, and 47 miles of private lines. The government contracted for five branch lines in 1910 to Bonavista, Heart's Content, Grate's Grove, Trepassey, Fortune Bay and Bonne Bay, at \$15,000 per mile for construction and 4,000 acres of land per mile constructed for operation. These lines were opened by 1914 and have opened up fertile sections of land. There are 736 post offices, 4,524 miles of telegraph line and 926 miles of telephone wire.

Education.—This is conducted on purely denominational lines, each sect controlling its own educational money. Even the Salvation Army has its separate schools. In the capital and larger communities it works fairly well. The colleges and high schools are very efficient. In the smaller places this system of division is ruinous to good instruction. Its very worst effect is seen on some of the small islands where it actually destroys education. Students at colleges of the Roman Catholic Church, 492; Methodist colleges, 475; Church of England colleges, 375. The Church of England has 395 schools of all kinds, the Roman Catholic 368 and the Methodist 364, and other denominations

52. The attendance in Roman Catholic 17,560, Church of England 16,362, Methodist 15,488 and others 2,072, making a total of 51,482. The total expenditure on education in 1914, including government grants, fees, etc., was \$400,358.

Religion.—The principal denominations are Roman Catholics with 81,177 adherents, Church of England, 78,616; Methodists, 68,042, Salvation Army, 10,141; Presbyterians, 1,876 and 2,767 of other denominations.

Government.—The government is administered by a governor, assisted by an executive council not exceeding nine members, a legislative council not exceeding 24 members and an elective house of assembly consisting of 36 representatives. Members of the legislative council receive \$120 per session, members of assembly \$200 or \$300 per session, according as they are resident or not in Saint John's. The legislative council is nominated by the governor.

Population and Principal Towns.—In 1914 the population of Newfoundland was 247,710 (126,239 males and 121,471 females). The inhabitants are chiefly of Anglo-Saxon and Irish descent. Outside of the capital (32,292) there are no other large centres of population. The largest is Harbour Grace in Conception Bay, with 4,279 population; Bonavista, 3,696; Twillingate, 3,348; Carbonear, 3,703. Of the total population, 67,000 are engaged in the fisheries; 2,915 on farms; 5,376 are mechanics and 2,260 are miners. The birth rate is 30.42 and the death rate 15.66 per 1,000. In 1914 there were 11,260 immigrants and 10,825 emigrants.

History.—The early history of the Colony involves the story of the discovery of North America by John Cabot in 1497, a memorable voyage fraught with far-reaching consequences. The immediate result of the discovery was the springing up of a great transatlantic cod-fishery which first drew Britons from the narrow seas, made them a nation of sailors and laid the foundation of the British Colonial Empire. For a long time this industry was carried on secretly to avoid the exaction and tyranny of the Crown. There was not only a great fishery but a big barter trade in operation between the English and foreign sailors. By the reign of Elizabeth this business carried on by Devonshire men had grown so extensive that Raleigh declared it was the mainstay of the Western Counties then the chief maritime centre of England. The story of Newfoundland naturally divides itself into four periods. First, the early period from 1497 to 1610 when there was neither law, religion or government in the island. English and foreign fishermen were ruled in a rough way by the valiant men of Devon, traders and pirates. Second, the fishing admiral period, 1610 to 1711, a time of struggle between the settlers and the ship fishermen from England. The permanent inhabitants were very much aided by their colonial brethren from the American Colonies. Trade began with them in 1641 and so increased that by the time of the Revolution it amounted to \$4,000,000. One of the largest items in this trade was the supply of New England rum. Thousands of Devonshire men were smuggled away every year to New England and thus helped to build up the trade fisheries of the American Colonies which became so formidable as to rival England and excited the great admiration of Edmund Burke. Third, from 1711

to 1825 when the island was under naval governors and at last possessed a resident ruler and a form of settled administration. Fourth, the modern period from 1825 up to the present time. When first the Colony was discovered it was inhabited by a branch of the great Algonquin family of Indians known amongst themselves as the "Beothucks." Their principal settlement was in the interior around Red Indian Lake. They became extinct early in the last century. Misunderstandings arose between them and the white men and the feud ended in the dire disaster to the aborigines. Starvation and disease combined with the dire hostility of the Mic-Macs who early obtained the use of firearms helped to destroy this interesting race.

The modern period can only be very briefly sketched. The Colony suffered severely from the policy of the Home Government which opposed settlement and tried by every means to use the island simply as a fishing station for British fishermen. No grants of land were issued until 1813. After the country obtained a local government in 1832 and full responsible government in 1855, it went ahead fast. The most wonderful feature in its history is the marvelous recuperative power of the insular population,—under the direst calamities, invasions from the French, fires and lastly in 1892 a conflagration, which consumed half the Capital, followed in 1894 by a bank crash which financially ruined nearly every one in the island. The real advance of Newfoundland may be dated from the advent of the railway in 1881, since built right across the island, and giving regular communication with the United States and Canada. The movement was bitterly opposed by the fish merchants and others but every one now recognizes its beneficial results in building up new industries. The principal events in the modern history of the island were the settlement of the fisheries dispute with France and later with the United States. Federation with Canada has been more than once a burning political issue and even yet there are a few in favor of it.

Revised by J. B. McDONNELL.

NEWFOUNDLAND, Bank of, in its widest sense is a submarine island 600 miles long and 200 miles broad covered by water less than 50 fathoms deep, lying off the island of Newfoundland, within a degree of the eastern

coast. They must be regarded as belonging to the primitive features of the terrestrial crust and forming part of the pedestal on which the American continent itself reposes. The confluence of the Arctic current and the Gulf stream generate here the fogs or vapors characteristic of the eastern waters of Newfoundland. During the spring, summer and autumn months when the Gulf stream prevails in this region, the mists roll up in abundance from the surface of the suddenly chilled waters and the surrounding seas become enveloped in fogs covering a space as large as France or even as half the European continent. The reports of sea-farers for the most part, familiar only with the southeastern ports and approaches of Newfoundland, tend to confuse the island itself with its banks; hence dense fogs are commonly regarded as a normal if not permanent feature of its climate. Doubtless during the prevalence of the south and southeast winds the vapors are rolled up from the banks by atmospheric currents, and at such times they are spread in thick masses over the creeks and inlets along the south coast. But as a rule they seldom penetrate far into the interior, and, according to the local saying, "The land eats the fog." The Great Bank, far more extensive than Newfoundland itself, does not present any indented contour lines like the shores of the island. The Great Bank is a curvilinear triangle with rounded outlines. If the whole submarine mass upheaved it would attach itself as a heavy peninsula to North America. A few cavities have been discovered in the sands of the bed. "Whale Hole," for instance, caused perhaps by the eddies of the conflicting currents in the western part of the Grand Bank, south of Cape Race, sinks to a depth of 400 feet. An equally deep chasm lies on the northwest. About 125 miles east another bank, called Bonnet-Flamand, rises in an oval mass above the chasms surrounding it, which sink to a depth of 500 fathoms. It is in the vicinity of these plateaus that the ocean bed drops into the deepest chasm yet revealed in the whole Atlantic. The seas break over the Newfoundland Banks although they are covered with water 40 or 50 fathoms deep. "Hence their approach is usually revealed to mariners," writes *Élisée Réclus*, "by the heavy chopping waters fringing their borders. But within this fringe of agitated waters the sea is generally calm, so that the Bank itself might be regarded as forming a veritable harbor of refuge but for the risk of collision with the fishing-smacks, or icebergs. The large Atlantic liners, the most dreaded in case of collision, owing to their speed and enormous size, pass regularly over the Southern 'tail' of the Bank, thereby prolonging their passage by three or four hours, but avoiding disaster. The long convoys of icebergs drifting with the polar current are a source of danger to be guarded against by the experience, skill and presence of mind of the mariners navigating these waters. The skipper has to study from a distance the aspect of the surface, the glint of the crystal masses reflected from the clouds, the dense fogs and clear skies. He must take note in the waters of the changes of temperature, of color and of animal life, and when the sea is wrapped in impenetrable mist he must be ready for every

contingency. These convoys, drifting down from the higher latitudes, pass for the most part along the eastern section of the Bank, a few straggling blocks alone attracted to the neighborhood of the Newfoundland coast. Their route is largely determined by the action of the Gulf Stream which sets in the direction from southwest to northeast.

"The hypothesis has long been advanced that the Newfoundland Banks have been formed by the débris of all kinds deposited by the melting icebergs in the region where converge the two opposing currents from Baffin Bay and the Gulf of Mexico. Careful observations have shown that in the North Atlantic the polar drift-ice contains but a very small quantity of the rocks and stony fragments and glacial clays either brought down with the glaciers from the rocky slopes of Greenland, or carried away from the bed of the lower gorges. All the blocks that get stranded on the Newfoundland coast are pure as crystal and singularly free from sedimentary matter. Hence they can have contributed little or nothing to the construction of the submarine bed stretching southeastwards from the island of Newfoundland. The fisheries grounds here are among the most productive in the world. The Banks are the chief breeding-place of the cod. Herring, salmon, trout, whales and seals are also found in great numbers. These treasures are stored by three nations: United States, England and France. See FISHERIES.

NEWFOUNDLAND, The French Shore Question in. The long-standing dispute between England and France about fishing rights in Newfoundland is generally known as "the French Shore question." Most writers begin its history with reference to the Treaty of Utrecht, (1713) when, by agreement between the two countries, certain privileges were given to the French on the west and northeast coast of Newfoundland. It really commences, however, with the defeat of the Invincible Armada. The extinction of Spain's naval power by that great victory left the two great powers face to face, and from this date begins the long duel between France and England for the command of the sea and the control of North America. The contest ended disastrously for France at the fall of Quebec and the battle of Trafalgar. Both her naval power and her great American Empire disappeared. All that now remained to her of New France were the two barren islets of Saint Pierre and Miquelon and the doubtful fishery rights in Newfoundland. It was the sentimental and national feeling involved in this dispute that made it so difficult to settle. The French claims are based on the Treaties of Utrecht (1713), Paris and Versailles, the main basis being the first of these agreements. It begins with declaring that the island of Newfoundland shall belong of right to Great Britain. Moreover, it shall not be lawful for the subjects of France to fortify any place in Newfoundland or to erect any buildings there, besides stakes made of boards and huts necessary and useful for the drying of fish, or to resort to the island beyond the time necessary for fishing and drying of fish. But it shall be allowed to the subjects of France to catch fish and to dry them on land, in that part only. The boundaries were first given between

Cape Bonavista and Point Riche on the west coast, afterward altered to the last limits between Cape John and Cape Ray. By the Treaty of Paris (1763) Saint Pierre and Miquelon were given to France. By the Treaty of Versailles (1783) the last boundaries were settled, and there was a secret declaration made by George III that the English were not to interrupt the French fishery by their competition. It was this last underhand clause, not made public in the Treaty, which has given rise to so much contention. The English government always claimed that it was a concurrent fishery. The French, and with right, argued that under this declaration their rights were exclusive—the French contention would have been unanswerable if they had been able to occupy the whole coast line, but, as a matter of fact, their business was solely confined to about a dozen stations. They encouraged English fishermen to settle near their establishments to take care of their property during their absence. As the French business on the coast declined the native settlers increased until they numbered 17,000, compared with the 300 Frenchmen. Difficulties and disputes between the rivals were constantly arising, and but for the tact and good management of the naval officers of both countries would have become acute. The highest authority on English foreign politics, Sir Charles Dilke, and Admiral Revilliere of the French navy declared it was "the most dangerous question between England and France." Carrying on this transatlantic fishery in rivalry with opponents who lived on the coast was utterly hopeless to the French. They were hampered with the burden of carrying on a business 2,000 miles from their base of supplies. Every season they had to bring out their men and gear from France, and in October to carry them all back again. No bounties could support such a hopeless undertaking. Up to the beginning of the last century the French carried on an immense business in Newfoundland as well as their Bank-fishery from Saint Pierre, but gradually the Shore fishery declined until of late years it has come down to a dozen old brigs and about 300 men from France. Although bounty was piled on bounty and millions of francs were spent by the home government in trying to keep the business alive, it went down and down. For a time after 1890, when by a "modus vivendi" the French were allowed to erect lobster factories, an added impetus was given to the industry. At that time 7,000 cases of lobsters, at \$11 and \$12 a case, were really worth more than their whole catch of cod. Eventually the lobsters became fished out. Since 1842, 20 commissions have sat upon the question, but no agreement could be arrived at. When the Anglo-French Convention of 1904, known as the Lansdowne-Cambon Convention, was eventually agreed on, the most difficult subject of all was the French shore dispute, but the great French Minister Delcassé rose to the occasion and made the nation actually believe that, although England was giving France a free hand in Morocco, territory in Africa, and valued gifts elsewhere, French fishery rights in Newfoundland still remained intact. As a matter of fact, the old treaties have been annulled. All the French fishermen have been paid more than 10 times the value of their premises, boats,

gear, etc., \$275,000, and since the agreement in 1904, and the arbitration about values, not a solitary Frenchman has ever returned to the French shore.

NEWFOUNDLAND DOG, a large, handsome, long-haired, water-loving dog, originating in Newfoundland, probably from a cross between the native Indian sledge-dog and imported European dogs introduced by navigators early in the 17th century, and especially by the pointer. The breed showed extraordinary retrieving powers and was sent to Europe in so large numbers and at so high prices that it long ago became almost extinct in Newfoundland. It has, however, been maintained pure and has also increased in size by various breeding kennels both in Great Britain and the United States. The Newfoundland is massive in appearance and may attain a height of 31 inches at the shoulders; the average weight for dogs is 100 pounds and for bitches 85 pounds. The head is broad and massive with flat skull and somewhat square muzzle and the ears are small and lie close to the head. The fore legs are straight and the hind legs capable of powerful action and the tail is carried gaily but not curled over. The hair is straight and very thick and in color is black, black and white or bronze. For rescue work directed from the monastery of Saint Bernard in the Alps, the Newfoundland has superseded the famous Saint Bernard dog. For standard of points see Dog.

NEWGATE PRISON. At first marking the "New Gate" of the city of London as far back as the beginning of the 12th century, "New Gate" became Newgate prison in 1218, and throughout its career of 700 years, earned for itself a most unenviable reputation. It was rebuilt in the 15th century; the great fire of 1666 partially destroyed it, and the last edifice was erected in 1780, but suffered greatly in the Gordon Riots of that year, when 300 prisoners, felons as well as debtors, were let loose on the public. (See DICKENS' 'BARNABY RUDGE'). As late as 1850 prisoners were kept in herds like cattle, with no cleaners to attend to them. Proper sanitation or even decent ventilation was unknown in Newgate even up to the date of its demolition, and no attempt at all was made to separate the sexes until the early part of the 19th century.

Prisoners arrested by the king's warrant were the first inhabitants of Newgate. Then came Jew child-murderers and debtors. Thieves and other criminals were in due course locked up there, where they mixed with debtors, and owing to slackness of administration it became a great school of crime. Up to 1818 prisoners cooked their own meals. New "clients" were compelled to pay "garnish" or "footing" to their fellow-prisoners. If they could pay they could secure luxuries. If they were poor, they had to beg even for food. Prisoners were tortured at Newgate in the days of religious persecution. Many of them stayed for years and died there without ever having their cases heard in any court. Condemned criminals, during several reigns, were sent to Newgate, where Dick Turpin was incarcerated and others of his contemporaries. With an eye to their "edification," prisoners under sentence of death were at one time seated in the "condemned pew" around a

coffin at the chapel services. The building was gradually disused after 1877, and it was demolished in 1904 to make room for the Middlesex Sessions House. Consult Griffith's 'Chronicles of Newgate.' (1884).

NEWHALL, nū'hāl, Charles Stedman, American author: b. Boston, Mass., 4 Oct. 1842. He was graduated at Amherst in 1869 and at Union Theological Seminary in 1872. He held the pastorate of various churches and for a time served as teacher and college professor. In 1897 he was appointed United States assistant special forest agent and a little later superintendent of the United States Forest Reserves of central and northern California. He continued in the United States Forestry Service until 1905. He has written 'History of Fall River' (1862); 'Ruthie's Story' (1888); 'Vines of Northeastern America' (1897); 'Fire and the U. S. Reserves' (1902); 'Joe and the Howards' (1869); 'Harry's Trip to the Orient' (1885); 'Trees of Northeastern America' (1890); 'Shrubs of Northeastern America' (1893); 'Sheep and the U. S. Reserves' (1901); 'Lumbering and the U. S. Reserves' (1905), etc.

NEWHAVEN, England, town in Sussex, 56 miles south of London and eight miles east of Brighton. It was the ancient port of the Ouse and is now the well-known place of embarkation for Dieppe, between which place and Newhaven large and fast steamers ply daily in connection with the *Chemin de fer de l'Ouest*. The tidal harbor is enclosed by two piers and a breakwater, and Newhaven is one of the finest roadsteads on the English coast. The area is about 30 acres. The port is protected by fortifications. The shipping was of great importance in the 18th century; then it declined, and of late years it revived again. The harbor was first granted in 1713. Saint Michael's is a beautiful Norman church of the 12th century with a square Norman embattled tower and small semi-circular apse, curiously like that of Yainville-sur-Seine. At Bishopstone, one mile distant, is an interesting church with a Saxon porch and dial. Newhaven has a large coasting trade of coal and provisions, and France sends here wine, spirits, silk, fruit and vegetables. Considerable ship-building is also carried on. In the Bridge Hotel, Louis Philippe, a refugee from France, stayed in 1848 under the name of "Mr. Smith." Pop. 6,665.

NEWLANDS, Francis Griffith, American senator and legislator: b. Natchez, Miss., 28 Aug. 1848; d. Washington, D. C., 24 Dec. 1917. He studied at Yale, in the Columbian Law School (now George Washington University) in Washington, D. C., and was admitted to the bar in the District of Columbia in 1870. He practised law in San Francisco until 1886, when he became a trustee of the estate of his father-in-law, William Sharon, once United States senator from Nevada. In 1889 he removed to Nevada, settling in Reno. Here he became an ardent advocate of free silver coinage. He also took a vital interest in irrigation development and other matters of western interest. He was elected to the House of Representatives as a Democrat in 1893 and continued by re-election until 1903, when he became United States senator succeeding J. P. Jones. In 1909 and in 1914 he was re-elected. He framed the

Newlands Reclamation Act (1902); was member of the committees of ways and means, foreign affairs, etc.; was chairman on interstate commerce, prominent in rate legislation, internal improvement measures, regulation of industrial combinations and tariff bills. Yale gave him the degree of M.A. in 1901. For years Senator Newlands' chief interest had been in America's railway transportation lines and in the development of national waterways, both for transportation and for greater fertility of land. He was regarded as the pre-eminent expert on these matters. As author of Newlands Act, which provided a plan of land improvement in the arid West by development of waterways, he gained celebrity. For a long time he pressed legislation for the expenditure of many millions of dollars for waterways and irrigation improvement. In his railroad legislative work Senator Newlands enjoyed the closest confidence of President Wilson and was regarded as the administrative spokesman on such matters in the Senate. He was an earnest Democrat, but he regarded himself wholly as a public servant, and was one of the staunchest supporters of President Wilson in the Senate. On 24 Dec. 1917 he went to the Capitol to take up work in connection with an investigation by the Senate Interstate Commerce Committee, of which he was chairman, and was stricken in his office, dying shortly afterward.

NEWLANDS ACT. See **ARBITRATION, INTERNATIONAL.**

NEWMAN, Albert Henry, American Baptist clergyman and educator: b. Edgefield County, S. C., 25 Aug. 1852. He was graduated at Mercer University, Georgia, in 1871, and from the Rochester Theological Seminary in 1875. He became a college professor, and in 1881-1901 filled the chair of church history at McMaster University, Toronto, Ont., and 1901-07 held a professorship at Baylor University, Waco, Tex. From 1907 to 1913 he was professor of church history and dean of the faculty of the Southwestern Baptist Theological Seminary. He was professorial lecturer in the University of Chicago, 1905-12. Since 1913 he has been professor of church history in Baylor University. He was a contributor to the third edition of the 'Hauck-Herzog Realencyklopädie für Protestantische Theologie und Kirche' and to 'Der Protestantismus am ende des 19 Jahrhunderts,' to Hastings 'Dictionary of Christ and the Gospels' and 'Dictionary of Religion and Ethics,' etc. He has written 'The Baptist Churches in the United States' (1894); 'A Century of Baptist Achievement' (1901); 'Manual of Church History' (1900-03). He also translated and edited Immers' 'Hermeneutics of the New Testament' (1877). He was department editor for church history of 'The New Schaff-Herzog Encyclopedia of Religious Knowledge,' etc.

NEWMAN, Allen George, American sculptor: b. New York, 28 Aug. 1875. After receiving his education in the City College of New York and at the National Academy of Design in the same city, he devoted himself to sculpture. Among his numerous works are 'Night and Day' for the Harriman Bank, New York; 'Henry Hudson Monument,' erected by Colonial Dames of America at 72d street and Riverside Drive, New York; 'Joel Chandler

Harris Monument,' Atlanta, Ga.; 'Monument to the Women of the South,' Jacksonville, Fla.; 'General Philip Sheridan Monument,' Scranton, Pa.; 'General Oates, ex-Governor of Alabama,' Montgomery, Ala., and 'General Stirling Price,' Keytesville, Mo. He also made a bronze group, 'The Triumph of Peace,' Atlanta, Ga., and 'The Hiker,' a Spanish-American War soldier, Providence, R. I. Mr. Newman is a member of the National Sculpture Society, the Architectural League, the Union Internationale des Beaux Arts et des Lettres, and many other societies and clubs.

NEWMAN, Francis, English colonial governor in America: b. England, about 1600; d. New Haven, Conn., 18 Nov. 1660. He emigrated to New Hampshire in 1638, settled later in New Haven; was one of the committee which waited upon Peter Stuyvesant in 1653 to demand compensation for injuries received at the hands of the Dutch, and in 1654 became a commissioner for the united colonies. In 1658 he became governor of the New Haven colony, which office he held until his death.

NEWMAN, Francis William, English scholar: b. London, 27 June 1805; d. Weston-super-Mare, Somerset, 4 Oct. 1897. He was graduated at Worcester College, Oxford, in 1826; was Fellow of Balliol in 1826-30. Unable to subscribe to the 39 articles he withdrew and went to Bagdad as a missionary; became professor of classical literature in Manchester New College, York, in 1840; was professor of Latin at University College, London, 1846-69, and was made principal of University Hall, London, in 1848. A brother of Cardinal Newman (q.v.), the thought and faith of the two wholly diverged, the former accepting and the latter rejecting the entire historic basis of Christianity while retaining deistic belief. Francis made important contributions to the religious thought of his time. His 'Phases of Faith' (1850), an autobiographical narrative of his religious changes, excited much controversy and was undoubtedly his best-known writing; but 'The Soul: Its Sorrows and Aspirations' (1849), a singularly penetrating analysis of man's relations with God, shows him at his best. In 1876 he joined the British and Foreign Unitarian Association, of which he became vice-president in 1879. His further writings show the remarkable versatility of this liberal-minded but crotchety man, and treat of education, politics, religion and social questions. An interesting experiment was his 'Hiawatha Translated into Latin' (1862). Consult his 'Memoir and Letters,' edited by Sieveking (1909).

NEWMAN, John Henry, English author, theologian, preacher and cardinal in the Roman Catholic Church: b. London, England, 21 Feb. 1801; d. Edgbaston Oratory, Birmingham, England, 11 Aug. 1890. Newman was the eldest of six children of John Newman, a London banker, from whose family Newman inherited the taste for music which distinguished him. The family was of Dutch origin and had come to England in the latter part of the 17th century. Newman's mother, Jemima Foudrinier, was of French Huguenot origin. From her he received a religious training of Calvinistic tendency, and was early brought up with a thorough knowledge of the Bible, which it is

said he almost knew by heart. Newman, who was a precocious boy and wrote much verse and prose, describes himself in the 'Apologia' as an imaginative and superstitious child. From the writers who most influenced him in his youth—particularly Law and Thomas Scott—he obtained two important beliefs that clung to him through life, the idea of eternal punishment and a belief in the necessity of dogma. When about 16 he became convinced that it was the will of God that he lead a single life.

Newman entered Trinity College, Oxford, in his 16th year, took his degree in 1820, and was elected a Fellow of Oriel in 1822. Here he came under several distinct influences, which had a good deal of effect on his career. From Bishop Butler's 'Analogy,' which he read about this time, he gleaned the principles, which ever after characterized his work and on which he wrote much, that revealed religion as manifested in outward institutions is the symbol of the natural religion underlying—an idea that was in accord with his boyish dreams—and that "probability is the guide of life." The strong personal influences were Dr. Hawkins, Provost of Oriel, to whose teachings Newman says he owed the habit of caution in statement and the weighing of words, and, among other doctrines, that of the value of tradition; Dr. Whately, who for a time somewhat arrested Newman's spiritual growth and developed his reasoning power; and his intimate friends, John Keble and Hurrell Froude, spiritual enthusiasts and haters of liberalism. His studies for 'The Arians of the Fourth Century' (pub. 1833) which he began at Oriel, tended to confirm his belief that "antiquity was the true exponent of the doctrines of Christianity and the basis of the Church of England," and stimulated his innate belief in the existence of spirits, good and evil, which he regarded as the causes of physical phenomena. These studies also undoubtedly laid the foundation for the course of reasoning which subsequently led him into the Church of Rome. Meanwhile, his progress in his profession had been rapid. In 1824 he took orders and was ordained curate of Saint Clement's Church, Oxford. The following year he became vice-principal of Saint Alban's Hall under Dr. Whately, a position which he gave up in 1826 to become tutor at Oriel. In 1828 he was appointed vicar of Saint Mary's, his only permanent position while a member of the Anglican Church; for in 1829 he broke with Whately because of his dislike for the tendency of the latter toward liberalism, and a year or two later retired from his tutorship at Oriel, for the reason that Dr. Hawkins, who then came into power, looked upon him and his friends, Keble and Froude, as too extreme in their views regarding the need of conformity to a more rigid order of things.

Throughout this period Newman was gradually becoming alive to the conviction that he had a special mission to perform, and further stimulus was added by the French Revolution of 1830 and the struggle in England which culminated in the Reform Bill of 1832. These tendencies toward liberalism he viewed with growing distrust. Not, however, till the close of his voyage with Froude to the south of Europe in the winter and spring of 1832-33 (during which he wrote many poems, including 'Lead Kindly Light') did the conviction be-

come urgent. Taken so very ill in Sicily on his return voyage that his servant despaired of his life, he was nevertheless convinced that he should not die; he kept saying to himself "We have work to do in England." Hurrying thither as soon as his health permitted, he and his friends at once began the Oxford Movement (q.v.).

The object of this movement was in general the upholding of the ideal of primitive Christianity against the assaults of liberalism. It was pursued with great earnestness by Newman and his friends, Froude, Keble, Pusey, Rose and others, and the means were the 'Tracts for the Times,' of which Newman was chief editor and author. He speaks of himself as occupying a modest position, but he was in reality the head of the movement. He himself held confidently to three principles which he endeavored to inculcate: the necessity of dogma in combatting liberalism; the existence of a visible church, "with sacraments and rites which are the channels of invisible grace"; and the belief that the Roman Catholic Church and the Pope were evil and anti-Christian. The first two of these beliefs he retained till the end of his life; it was in regard to the last that his views were completely altered and upon that belief his subsequent history turned. For Newman the Tractarian movement had two phases: up to 1839 he wrote in the spirit of full conviction and confidence; from then till the publication of the famous Tract 90 in 1841 there was a growing consciousness of the unsoundness of the arguments that he had been using against Catholicism. The chief task in the first period was the definition of the so-called '*Via Media*' in which the Tractarians endeavored to establish the true position of the church between Romanism and Liberalism—to construct, in Newman's words, "a possible road between a mountain and a morass, to be driven through formidable obstacles, if it is to exist, by the boldness and skill of the engineers." The principal book in which the doctrine is expounded is 'The Prophetical Office of the Church Viewed Relatively to Romanism and to Popular Protestantism' (1837). By 1839 the soundness of his position seemed to be established; but his studies had, unconsciously to himself, laid the train for the overthrow of what he had been advocating, and these doubts took shape during the next two years. The argument from Antiquity with which he had supported the *Via Media* turned out to be an equally good argument for the Catholic Church. He also made the discovery that in church history there had been *via medias* before; the various early sects of heretics had in his new view occupied much the same position as the Anglican Church. He was impressed by the fact that the early fathers whom he invoked in support of his effort at true compromise would inevitably, if alive, have sided with Rome, and his imagination—always a strong influence in his reasoning—was haunted by the words "*Securus judicat orbis terrarum*," which seemed to make nugatory all schism. The result was that he grew far less hostile to the Catholic Church, and with Tract 90 the movement against it came to an end. The main point of that tract was that the Thirty-nine Articles of the Anglican Church had originally been framed for political rather than religious

purposes: they were designed to allow good Catholics to become members of the Anglican Church with mere loss of their allegiance to the Pope. If that was the case, then the Anglican had no better doctrinal support than the Roman Church.

From that time Newman regarded himself as practically dead to Anglicanism. In the storm of indignation which the tract evoked he did not, however, immediately retreat. Preferring to think the matter over carefully, he kept his living at Saint Mary's till 1843, and in that same year retracted the many hard things he had said about Rome. Two years later, in October, he entered the Roman Catholic Church, and early in 1846 left Oxford for good. After over a year in Rome (1846-47), he founded the Oratory of Saint Philip Neri, at Edgbaston, Birmingham, where, with the exception of four years (1854-58) spent in Dublin as rector of a new Catholic University, he remained until his death.

Though condemned as an apostate by common Anglican consent, and though living a very secluded life, Newman almost at once benefited by the change. Not only did he feel the peace of security, but his literary genius is said to have ripened wonderfully. Heretofore he had written somewhat tentatively, as one groping; now he expressed himself with sureness and an unwonted command of expression. His writings during the first 18 years after his conversion, nearly all in support of Catholicism, include such various types as his 'Discourses Addressed to Mixed Congregations' (1849); 'Lectures on Anglican Difficulties' (1850), and 'Lectures on Catholicism in England' (1851); various of the essays collected in 'Historical Studies'; two novels, 'Loss and Gain' (1848) and 'Callista' (1855); and what is in many respects his masterpiece of treatment, 'The Idea of a University,' a series of discourses which he delivered at Dublin in 1852 on the founding of the Roman Catholic University.

In 1864 occurred the controversy with Kingsley, which marks an epoch in Newman's life and in the position of the Catholics in England. Kingsley had said that the Roman clergy had little regard for truth, and had cited Newman as an advocate of cunning. Newman naturally asked for his evidence. Kingsley, in *Macmillan's Magazine*, where his first article had appeared, replied that he had mistaken Newman's tone, and apologized. Newman, reasonably dissatisfied with Kingsley's failure to produce the specific evidence, published the whole correspondence. Kingsley thereupon replied in a vigorous pamphlet entitled "What, then, Does Dr. Newman Mean?" in which he charged Newman with equivocation and cited all the instances he could find in Newman's life and works to prove his point. The merits of the controversy are as yet unsettled, though now of only historical interest; views would probably still range from extreme support of Newman to such words as those of Huxley, "That man is the slipperiest sophist I have ever met with. Kingsley was entirely right about him." ('Letters,' II, p. 240.) The effect of the controversy was the publication by Newman of the 'Apologia pro Vita Sua.' This, which appeared serially between 21 April and 2 June, gave the key to Newman's life as an internal state

The effect of the 'Apologia' was to temper in a great measure the feeling between the Catholics and the Anglicans, and it gave Newman the honorable position of peacemaker. From that time on he occupied a high place in England and received many dignities. In 1877 he was elected honorary fellow of Trinity College, Oxford, and two years later was created cardinal by Pope Leo XIII. Two works are to be especially noted, 'An Essay in Aid of a Grammar of Assent' (1870), in which Newman attempted to expound systematically the logic of belief aside from exact proof, and 'The Dream of Gerontius,' written shortly after the 'Apologia,' in which he delineated in poetical form the yearning of a soul toward certitude and truth.

These three books indicate where the place and power of Newman lie. His position is probably to be determined not by his intellectual contributions but by his personality which is of a high, noble and persuasive type, and which is expressed in a style of unsurpassed skill and delicacy. As a contributor of ideas and new truth, he is not so important. As a theologian, his life-long beliefs and teaching—that the world is controlled by the powers of darkness, that God is the only holy thing, that the Church is the only true revealer of God—in no wise differ from good Catholic opinion. The great argument on which he ultimately based all his claims, that of probability, that we act not from certainty but from states of certitude, that personality which can induce states of certitude is a better guide than strict reason—the basis of this he got from Bishop Butler, nor did he take into consideration the fact that his argument would allow anybody to believe anything at all, provided he could summon enough certitude in support of it. Doubtless the mass do use just such sanctions, and Newman has certainly, both in life and in work, put the argument as well as it has ever been put, but the method is wholly opposed to scientific proof, and it is easy therein to see the reason for the view of such men as Huxley. The truth of the matter probably is that Newman, with all his training in logic, really had little regard for strict evidence; his course during the Oxford movement shows that he argued from predispositions and predilections, and his conversion was in part at least the result of evidence supplied solely by his imagination. But as a gracious and winning personality his place is of the highest, as is his power of expression. See APOLOGIA PRO VITA SUA; DREAM OF GERONTIUS; IDEA OF A UNIVERSITY.

Bibliography.—The chief sources of information are, among Newman's many works, the 'Apologia,' and 'The Letters and Correspondence of J. H. Newman,' edited by his sister, Mrs. Anne Mozley. The best 'Life' is that by Wilfred Ward (1912), and it is based on his private journals and correspondence. Lives and studies are those of H. J. Jennings ('Cardinal Newman, The Story of His Life'); R. H. Hutton ('Cardinal Newman'); William Barry (in 'Literary Lives'). Materials for a complete study are scattered in various books as Church's 'The Oxford Movement,' Mark Pattison's 'Memoirs,' Abbott's 'Philomythus' and 'The Anglican Career of John Henry

Newman,) and a score of others (consult a long list in the 'Dictionary of National Biography.') The more recent works, Brémond's 'The Mystery of Newman'; Sarolea's 'Cardinal Newman and his Influence on Religious Life and Thought,' and Thoreau-Dangin's 'English Catholic Revival,' may be recommended. The 'Index' to Newman's works, by Joseph Rickaby (1914), is valuable not only as an index, but for the illustrations it affords of his intellectual and spiritual development. There is an excellent short study of the conversion and the theology of Newman by R. M. Lovett (*Harvard Monthly*, Dec. 1892, Jan. 1893).

WILLIAM T. BREWSTER,
Professor of English, Columbia University.

NEWMAN, John Philip, American Methodist bishop: b. New York, 1 Sept. 1826; d. Saratoga, N. Y., 5 July 1899. He studied for the ministry and in 1849 was ordained. After filling various charges he preached in New Orleans in 1864-69; held three times (1869-72, 1876-78, 1885-87) the pastorate of the Metropolitan Methodist Church in Washington, D. C., and was chaplain of the Senate for three sessions. He was appointed by President Grant inspector of United States consulates in Asia in 1873, in 1879 was called to the Central Church, New York, and from 1882-84 was pastor of Madison Avenue Congregational Church. In 1888 he was elected bishop. He delivered the funeral oration on General Grant. His eloquence was of a highly ornate kind. He wrote 'From Dan to Beersheba' (1864); 'The Thrones and Palaces of Babylon and Nineveh from the Persian Gulf to the Mediterranean' (1876); 'Christianity Triumphant' (1884); 'Evenings with the Prophets on the Lost Empires' (1887); 'The Supremacy of the Law' (1890); 'Conversations with Christ' (1901).

NEW MARKET, Canada, town in York County, Ontario, 34 miles north of Toronto on the Holland River, the Grand Trunk Railroad and the Trent Canal extension. It is connected to Toronto by an electric railroad. Places of interest are the Park, the Fairy Lake and 'David's Temple' in the suburb of Sharon. The Friends' College is situated here. Newmarket is an enterprising manufacturing town and produces flour, lumber, office fittings, leather, clothing and wooden-ware. Pop. 2,996.

NEW MARKET, England, a market town in Cambridgeshire, 14 miles northeast of Cambridge on the Bury branch of the Great Eastern Railway. A part of the town is in Suffolk. Newmarket, called the "Metropolis of the Turf," has been celebrated for its horse-races from the time of James I when there was hawking also. Charles I instituted the first cup race, and a fine palace was built on the site of the lodge of James I for the use of Charles II when he came to the races. The market-house and the celebrated Jockey Club are the chief buildings. The town is full of residences belonging to patrons of the turf and racing and training stables. The racecourse lies southwest of the town over Newmarket Heath. It has a full extent of four miles, but is divided into various lengths to suit the different races. The course is intersected by the great earthwork called the Devil's Ditch (also Saint Edmund's Dyke). It is five miles long—the largest of the four im-

portant dykes or entrenchments which marked, at different periods, the boundary lines between the kingdoms of East Anglia and Mercia. Eight race-meetings are held every year, the best known of which are the "Thousand Guineas" (April) and the "Cesarewitch" (October). On the outskirts of the town, toward Bury, is the Fairstead, or exercising ground, where the trial gallops of young horses take place daily. Near this is the well-known Warren Hill. In the neighborhood of Newmarket, Roman ruins have been found. Of its two churches, Saint Mary's, perpendicular style, is the most interesting. It is in Suffolk. Pop. about 10,482. Consult Hore, J. P., 'History of Newmarket and Annals of the Turf' (2 vols., London 1886).

NEWNAN, nū'nān, Ga., city, county-seat of Coweta County, on the Central of Georgia and the Atlanta and West Point railroads, about 38 miles south by west of Atlanta. It is in a productive agricultural region in which cotton and fruits are extensively cultivated. The principal industrial establishments are cotton mills, grain elevators, cottonseed-oil mills, machine shops, flour mill, tannery, fertilizer works, a large plant for manufacturing boilers, engines, presses and mill machinery, fertilizer works and an ice factory. There is a fine courthouse and a Carnegie library. The city owns the waterworks and electric plants. Pop. 7,037.

NEWNES, nūnz, SIR **George**, English journalist: b. Matlock, 13 March 1851; d. Lynton, Devonshire, 9 June 1910. He was educated in London and entered journalism. He was the founder of *Tit-Bits*, a very successful weekly, the nature of which is indicated by its title; and he also founded the *Strand Magazine* and was proprietor of the *Westminster Gazette*. He was member of Parliament (Liberal) for the Newmarket division of Cambridgeshire, 1885-95, was created a baronet in 1895 and returned to Parliament from Swansea 1900-10. He applied much of his wealth to public purposes.

NEWNHAM (nūn'am) **COLLEGE**, England, an institution for the higher education of women at Cambridge, founded in 1871 and incorporated in 1880. Ordinarily no students are admitted under 18 years of age; the course of study corresponds with that of Cambridge University. There are a number of exhibitions and scholarships connected with the college, which is conducted on the same lines as Girton (q.v.). The faculty numbers about 26 and there is an average attendance of over 200 students.

NEWPORE, Fort, a former Revolutionary fortification on Ward Creek, near Oneida Lake, N. Y.

NEWPORT, nū'pōrt, **Christopher**, English sea captain: b. about 1565; d. 1618. In 1592 he commanded a ship in the West Indian expedition; sailed to Virginia in 1606, 1607, 1609 and 1611, was wrecked on the Bermudas in the third of those voyages, but made his way to Virginia after many adventures recounted by Jourdain in the 'Discovery of the Bermudas,' which Shakespeare may have used in writing the 'Tempest.' In 1612 he entered the employ of the East India Company, for whom he made several very successful voyages.

NEWPORT, George, English naturalist: b. Canterbury, 4 July 1803; d. London, 7 April

1854. He was educated at the London University and became a surgeon, but devoted much time to entomology, in which science he made valuable discoveries. He wrote 'Observations on the Anatomy, Habits, and Economy of *Athalia Centifolia*' (1838); 'Catalogue of the Myriapoda in the British Museum' (1856), etc.

NEWPORT, Ark., city and county-seat of Jackson County, 85 miles northeast of Little Rock, on the Chicago, Rock Island and Pacific, the Saint Louis, Iron Mountain and Southern, and on the White River railroads. It is situated in a cotton-growing district and its industries are connected mostly with this crop, consisting of cotton and oil mills, lumber mills, iron foundry and stave and handle works. Pop. (1920) 3,771.

NEWPORT, England, a town of Monmouthshire, on the Usk, 134 miles by rail west of London. It is one of the great trading ports communicating with the Bristol Channel. As one of the principal outlets for the produce of extensive collieries and iron and steel works in the vicinity, it has extensive dock accommodation covering over 126 acres, railway and ship-building plant, and a transporter bridge across the river. Its public buildings are all of modern erection and include town hall, market hall, county offices, public baths, museum, art gallery and technical institute. Its most ancient buildings are the remains of a 12th century castle and the church of Saint Woollos, a large edifice partly of Norman date. Pop. 83,691.

NEWPORT, Ky., city in Campbell County, at the confluence of the Ohio and Licking rivers and on the Louisville and Nashville and the Chesapeake and Ohio railroads. Cincinnati, on the Ohio, and Covington, on the Licking, are opposite Newport. The city was settled in 1791, in 1795 was incorporated and in 1850 was granted a city charter. It is a popular residential city for Cincinnati business men. It is in an agricultural region and farm products are among its most important shipments. The chief manufacturing establishments 'are sheet-iron works, carriage works, watch-case factory, steel plant, fly-screen works, lithographing plant and airchrome decorating works. It has large coal and brick yards and considerable river trade. Fort Thomas, a government military post, is on an elevation near the city. Some of the prominent buildings are the city hall courthouse, post office, the banks, a Masonic temple, the churches and schools and the library. It is the seat of Mount Saint Martin's and Immaculate academies and it has good public and parish schools and a public library. The city now has commission government. It was formerly under the charter of 1894, which provided for a mayor who held office for four years and a council. The mayor appointed the police and firemen and the members of the water commission, and, subject to the approval of the aldermen, the superintendent of public works and the city auditor. The council elected the bridge commissioners. The board of education is elected by the people and the members hold office two years. The waterworks is owned and operated by the municipality. Pop. 29,317.

NEWPORT, N. H., town, county-seat of Sullivan County, on the Sugar River and on the Boston and Maine Railroad, about 35 miles

in direct line northwest of Concord and 45 miles northwest of Manchester. Its scenery and climate make it a favorite summer resort. It is in an agricultural and grazing region and the good water power contributes to its industrial prosperity. Its chief manufactures are woolen goods, agricultural implements, shoes, lumber and lumber products, clothing and dairy products. The Richards Library and Museum, the Carrie F. Wright Memorial Hospital and a high-class modern hotel are notable buildings. It is within six miles of Lake Sunapee, one of the most beautiful lakes in the world, and within three miles of the famous Corbin's Blue Mountains Forest Park. "Good roads" is one of the town's slogans and its streets and sidewalks are among the best for a town of its size in the State. The city owns and operates the waterworks. Pop. 4,400. Consult Wheeler, 'The History of Newport, N. H.' (Concord 1879).

NEWPORT, R. I., city, port of entry, county-seat of Newport County, in Rhode Island, on Narragansett Bay, and on the New York, New Haven and Hartford Railroad, about 30 miles south of Providence. It has daily steamer communications with Providence, New York, Fall River and other ports. It is a famous summer resort and in the season its facilities for transportation are much increased. Its beautiful scenery, equable climate, ease of access by land and water from New York, Boston and other large cities, make it a favorite watering place. Its occupancy by people of great wealth, who have built summer residences costing millions of dollars, has made it fashionable and exclusive. In 1639 Newport was settled by Roger Williams and later Anne Hutchinson and other refugees, who for religious convictions had been expelled from Massachusetts by the Puritans, came to Newport. At first Newport was independent in government, but in 1644 Roger Williams obtained a patent from the British Parliament under which all the colonies in what is now the State of Rhode Island were united under the name of "The Incorporation of Providence Plantations in the Narragansett Bay in New England." The charter gave much dissatisfaction and in 1663 was changed to a charter that continued in force until 1843. (See DORR'S REBELLION). A public school was established in Newport in 1840. From the beginning the place was a trading port of importance; its commerce was greater than that of New York in 1769-70. One of the first acts of resistance against Great Britain took place at Newport when the British sloop *Liberty* was destroyed here, while engaged in enforcing obnoxious smuggling laws. The British took possession of Newport 6 Dec. 1776 and held it for two years. The shipping of the place and the general trade were nearly destroyed during the Revolution. The British soldiers burned in all about 475 houses. In 1780 Rochambeau and his troops from France made Newport their headquarters. In 1784, the year after the Revolutionary War had closed, Newport was incorporated; but in 1786 it surrendered its charter and was not reincorporated for 77 years.

It is claimed by some historians that Newport and other parts of the United States were discovered by Northmen as early as the 11th

century. The "Old Stone Mill" in Touro Park is pointed out as a relic of the days of the Northmen; but it is now generally believed that this mill was built in the 17th century. Newport was one of the capitals of the State until 1900. Bishop Berkeley lived in Newport from 1729 to 1732 and here wrote his ode on Western progress and part of his 'Alciphron.' William Ellery Channing and Commodore M. C. Perry were born in Newport. Some of the historic places are the State House built in 1742; the city hall built in 1763; Redwood Library, 1748; Trinity Church (P. E.), 1725; the headquarters of the British army (Sayer House), in 1780. One of the oldest newspapers in the United States still in existence is the *Newport Mercury*, established by James Franklin in 1758. The oldest part of the city is around the harbor; the modern part, with its magnificent mansions, surrounded by well-kept lawns, is toward the ocean. Overlooking and guarding the harbor are Fort Greble and Fort Adam. Some of the attractions other than those mentioned are the long beaches, the bathing places, the "Hanging Rocks," the 12-mile Ocean Drive, Purgatory (a rocky fissure 50 feet in depth), the Cliff Walk and the Spouting Rock (when the water is disturbed by a storm it is forced through an opening in this rock). It has a United States torpedo station on Goat Island and a United States Naval Training Station and War College on Coaster Harbor, also a naval hospital (1897). The city has many parks, fountains and monuments which are works of art. It is the seat of Saint George's and Cloyne House schools and Saint Mary's Academy. A valuable collection of relics are in the Newport Historical Society building; there are several libraries, the People's, Redwood and others.

It still has a large fish trade, but the city is now known for its society life and its industries and commerce are of little value. Pop. 30,472. Consult Arnold, S. G., 'History of the State of Rhode Island' (2 vols., New York 1860); 'Rhode Island Colonial Records'; Brooks, 'The Controversy Touching the Stone Mill'; Greene, 'The Providence Plantation'; 'Newport in the Revolution,' an article in the *New England Magazine*; Mason, G. W., 'Reminiscences of Newport' (Newport 1884); Stone, E. M., 'Our French Allies' (Providence 1884).

NEWPORT, Vt., village, county-seat of Orleans County, on Lake Memphremagog, and on the Boston and Maine and the Canadian Pacific railroads, about 50 miles in direct line north by east of Montpelier. In the summer season it has regular steamer communication with all the villages and towns on the lake. It is a favorite summer resort on account of its climate, the scenery in the vicinity and the opportunities for fishing. Its trade is chiefly in farm products; its manufactures are lumber veneer of all kinds, large overall factory and creamery. It has fine church and school buildings and the Goodrich Memorial Library which contains 9,000 volumes. Pop. 4,976.

NEWPORT NEWS, Va., city and port of entry in Warwick County, on the James River and Hampton Roads, and at the terminus of the Chesapeake and Ohio Railroad, situated 70 miles southeast of Richmond and 14 miles north of Norfolk. The city lies in the centre of a

rich vegetable and fruit country. It is connected with Hampton and Old Point Comfort by electric railways. In the heart of the city facing the James River is Casino Park, which has become a popular resort. With several foreign and coast lines of steamships sailing hence, and with a fine harbor and excellent shipping facilities, Newport News has very recently become an important port and the centre of large commercial interests. The foreign trade in 1916 amounted to about \$79,000,000; the exports amounting to about 90 per cent of the above. The foreign commerce of the port is largely carried on by the Chesapeake and Ohio Railroad and the United States Shipping Company, making direct connection with England and the Continent. The city has become fourth in the United States in the shipment of grain. Here is an extensive shipbuilding plant, one of the largest in the world, giving employment to over 10,000 workmen; three dry-docks, 600, 700 and 900 feet long; two grain elevators with a capacity of 2,850,000 bushels; wood-working mills, ice factories, lumber mills, iron works, shoe factory, coal wharves, shirt factory and brewery. Newport News is governed, under its original charter of 1896, by a mayor, elected every four years, common council, consisting of 16 members, and a board of eight aldermen. The city has an improved system of waterworks and electric light and gas plants. Newport News is a young town practically lacking in history. It was first laid out in 1882 and incorporated in 1896. Its growth has been very rapid; the population in 1890 was 4,449; in 1917 it was 23,674; in 1920 it was 35,596.

NEWRY, nŭ'ri, Ireland, seaport and parliamentary borough in County Down and Armagh, on the Newry River, 38 miles southwest of Belfast and 73 miles north of Dublin by the Great Northern Railway. It is also on the Newry Canal at the head of Carlingford Lough and is connected also by canal with Lough Neagh. The place dates from 1131. In 1175 an abbey was founded here by Maurice McLoughlin, king of Ireland, and in 1543 this abbey was converted into a collegiate church for secular priests. It was dissolved by Edward VI, who granted it to Sir Nicholas Bagenal, marshal of Ireland. Bagenal made it his residence and laid the foundations of the town's prosperity. The castle, erected by De Courcey, was taken by Edward Bruce in 1318. In 1689 Newry was set on fire by the Duke of Berwick retreating before Schomberg. James I and James II granted charters to the town. Newry is handsomely built and the situation is striking as it lies in a narrow valley surrounded by mountains. The western part, called Ballybot, is connected with the older town by four bridges over the canal and four over the tidal water. Newry is one of the most important ports of the province of Ulster. It admits vessels of 2,000 tons to Victoria Docks, three miles from town. Vessels drawing 15 feet can ascend the canal to the Albert Basin. In connection with several sub-ports further down the Newry River it is the outlet for a large trade, particularly with Liverpool and Glasgow, in cattle and agricultural produce. Flax-spinning, weaving, tanning and granite polishing are the chief industries. The town possesses rope and sail-works, breweries, distilleries, tanneries and

hour-mills. Fine granite is quarried in the neighborhood. Pop. 12,587.

NEWS-LETTER, a popular name applied to the printed sheets or letters issued weekly in the early part of the 17th century, the news for which was collected in the coffee-houses. Originally they were literally letters of news written by professional newswriters and sent by them to their employers weekly. Many early printed newspapers took *News-Letter* as a title, as the *Boston Newsletter*, etc.

NEWSPAPER, a publication devoted primarily to daily sheets publishing the news as to current events. The term is also construed to cover semi-weekly and some weekly papers of the same class. Along with the news, newspapers customarily print comment, criticism or discussion of such events by editors and contributors. As such, the newspaper has become one of the most powerful factors in modern existence. Not only does it serve as a distributor of every form of knowledge, but it also guides the opinion of great masses of people, and more important still, it becomes the voice of the people; so that the demands of a newspaper with a large clientele are listened to attentively by all public officials from the highest to the lowest.

As a rule, newspapers are conducted for the money to be obtained by their publication. In a few cases they are operated by their owners as organs of their individual expression, or in the special interest of some political movement.

The cost of making a newspaper is prodigious. There are heavy charges for cable and telegraph news; a large staff of local newsgatherers must be maintained; special correspondents at points of great activity must be provided; the office forces must necessarily be of high-grade minds—not to mention the intricate and expensive machinery required to actually produce the printed sheet in the briefest possible period. The great weakness of the newspaper is its dependence upon its advertising patronage for its livelihood, the price at which it is sold to readers being scarcely more than the cost of distribution. Under these conditions it is not likely that the newspaper will print material which would tend to injure the business of the advertisers which support it, so that to some degree at least the advertising may be said to control the policy of the paper.

The larger daily morning papers usually publish two editions; the first for suburban distribution, the second for city circulation. The larger evening dailies print several editions, the first about noon, or even before, and three or four later editions, the last leaving the press about six o'clock. Later news of great importance or interest is handled in an "Extra." The principal dailies issue a Sunday edition made up of six or eight classified sections—News, Editorial, Dramatic, Sports, Household, Special Articles, etc.

Much of the general news, foreign and domestic, is gathered and transmitted to the individual papers by press associations. This service is distributed to a large number of subscribing members of the association, and the cost of gathering it is thus minimized. In addition to this association service, most of the larger papers have their own correspondents

at centres of important news and receive daily a very considerable special service by telegraph.

Making the Newspaper.—In the making of a newspaper the fundamental work is literary. The control of the character of the material prepared is vested in the editor-in-chief, who is in some cases also the principal owner. Upon him is laid the responsibility for the heads of the departments who are immediately in charge of the production of the literary material of the paper. The editorial writers are directly under the editor-in-chief and do their work in accordance with his suggestions or instructions. The managing editor is an executive. He directs the make-up of the paper, deciding what shall go in and the space it shall occupy. He calls upon the several editors for the material he may need to fill out the vacant spaces. In the actual construction of the paper, he or his assistant is on duty until the last page form is complete. In some instances the managing editor and the editor-in-chief are one. The city editor is in charge of the collecting of local news through his staff of reporters, who may number from 10 to 50. He assigns certain reporters to particular tasks, so as to "cover" all events likely to be of public interest. In the case of a morning paper the city editor is usually succeeded by a "night editor" who remains on duty until the forms are on the press. In the larger newspaper offices there is also a news editor, who receives and edits the telegraph and cable news. There may also be a political editor, whose province it is to write editorials in the interest of the political party with which the paper is affiliated; and a financial editor who records and comments upon the fluctuations in market values of stocks, bonds, etc. There must be also a sport editor, a dramatic editor and a musical editor, whose duties are sufficiently indicated by their titles, the two latter holding as well the positions of critics. The literary editor has charge of the strictly literary articles, book reviews, etc.

All the copy passes from the various editors to the "desk" where it is read by responsible assistants to the editor-in-chief, corrected as to character of statement, form and, if need be, spelling, punctuation, etc. From the desk it goes to the composing-room and is then under the direction of the superintendent or foreman. He is essentially a mechanic, whose duty it is to construct in type the literary material furnished him. In the city offices and in many of the larger country offices typesetting machines are in use, though a great deal of type is still set by hand. The typefounders report a continually increasing demand for their product despite the spread of the typesetting machines. The type as set, by whatever means, is assembled into page forms by the foreman under the direction of the managing editor. When the page is satisfactorily filled, the printing may be done directly from the type for a small issue. In the offices of the large papers the page forms are stereotyped and the printing done from the plate thus made. The pages are assembled for one side of the sheet on which the paper is printed in one part of the press and for the other side in another part, the web of paper passing first one set of page forms and then the other. When printed on both sides it passes to the folding machinery which folds and cuts apart

the individual papers and counts them at the delivery shelf. They are then delivered to the circulation manager whose business is to sell as many of them as possible. He has his force of delivery automobiles which hasten out on their various routes, leaving the bundles with news dealers or distributors.

The business department of the paper attends to the financial part of the combination, and with this department is associated the advertising editor, whose copy also goes independently to the composing-room, or to a separate jobroom, coming back in the form of type to the superintendent and the managing editor. With all its seeming complexity the various operations are carried on at top speed with perfect accord and with rarely a serious hitch.

Various commercial enterprises have arisen in connection with newspaper making. Some of these are known as "syndicates" who buy literary material from authors and sell it to newspapers in that form; or they may stereotype it and sell the "plate-matter," as it is called, ready for placing it on the press. Other syndicates or co-operative bureaus make up and sell newspaper sheets printed with items of general interest on one side. These are known as "patent insides" and are used very largely by country papers, which by their use have their typesetting reduced to half. The "patent insides" generally carry sufficient advertising to cover their cost and therefore are sold at little more than the cost of the paper they are printed on.

The total number of newspapers and periodicals published in the world at present is estimated at about 60,000, distributed as follows: United States and Canada, 26,360, of which about 2,600 are dailies and 650 semi-weeklies; Germany, 8,000; Great Britain, 8,000; France, 4,300; Japan, 2,000; Italy, 1,500; Austria-Hungary, 1,200; Asia (exclusive of Japan), 1,000; Spain, 850; Russia, 800; Australia, 1,000; Greece, 600; Switzerland, 450; Holland, 300; Belgium, 300; all others, 1,000. Of these more than half are printed in the English language. These figures were correct before the war. Since that outbreak many publications have ceased, but it may be presumed that they will generally resume upon the return of normal conditions. A detailed history of the newspaper in America will be found under **NEWSPAPERS, AMERICAN**.

Early Roman Bulletins.—The newspaper had its origin several centuries before the Christian era. The Romans published the *Acta Diurna*, the *Acta Publica*, the *Acta Senatus* and other journals. The *Acta Diurna* was a bulletin in which accounts were given of the progress of the imperial arms. The intelligence was communicated by the generals who received it from the officers under their command, and thus the contents became known throughout the army. The *Acta Diurna*, however, recorded other than military matters, such as trials, punishments, deaths and sacrifices. The *Acta Senatus* contained accounts of the various matters brought before the Senate, the opinions of the chief speakers and the decisions of the house, published regularly by command of Julius Cæsar, as part of the government gazette. The *Acta Publica* was a still nearer approach to the true newspaper form. During the later times of the republic, and

under the empire, it was published daily at Rome by the authority of the government. It contained a register of the births and deaths in the city; an account of the money paid into the treasury, from the provinces and everything relating to the supply of corn, and a kind of court circular, containing an account of the births, deaths, festivals and movements of the imperial family. Such details of public affairs as it was deemed expedient to publish were also included in it. The speeches in the Senate and the public assemblies were taken down by the early Roman short-hand writers called *actuarii*. These, assisted by clerks and notaries, drew up the *Acta* under the superintendence of censors, quæstors and other magistrates. The publication consisted in posting them in some public place, that any one who pleased might read them.

First Printed Journals.—"Ti Chau," better known as *The Peking Gazette*, was probably the first printed newspaper, and is the oldest daily journal in the world. It was first issued about 1340 A.D. The *Gazette* is still in existence, and is an official journal, forming a pamphlet of 20 to 40 pages of coarse paper, printed from wooden types on one side only, and having a colored paper cover. Toward the close of the 15th century, soon after the invention of printing, small sheets, usually in the epistolary form, appeared in Augsburg, Vienna, Ratisbon and Nuremberg. They were called *Relationen* and the *Neue Zeitung*, and gave accounts of the discovery of America and of other important public events, and like modern newspapers they chronicled the more interesting and startling local incidents. The *Notizie Scritte*, published monthly in Venice, in 1562, is said to have been the first Italian newspaper. Its price was a small coin called gazetta; hence the word gazette which came to be the popular name for the modern newspaper. The war which Venice waged in Dalmatia gave rise in 1563 to the custom in Venice of having military and commercial information read at a particular place by those desirous to learn the news, who paid for this privilege. A file of these Venetian papers, covering a period of 60 years, is still preserved in the Magliabecchi Library at Florence.

English Newspapers.—A printed bulletin entitled *Relations* was published in England as early as 1462, and in 1527 there was one called *New Tidings*, but neither of these presented more than a single piece of intelligence. A pamphlet called *The Neues from Spaine* made its appearance in the reign of Queen Elizabeth in order to convey to the people the tidings of the approaching armada from Spain, and the various counter-movements on the part of the British army and fleet. The first newspaper printed in English was published in Amsterdam, 2 Dec. 1620. It was a folio sheet printed both sides; and was issued by the Dutch bookseller Petrus Keerius, and his printer, Joris Veseler. A more pretentious journal was issued in 1622, under the title *The Weekly News from Italy, Germany, etc.*, published by Nathaniel Butter, Nicholas Bourne and Thomas Archer, and this may be regarded as the first specimen of the regular newspaper in England. Numerous other news journals followed, but it was not till the beginning

of the parliamentary wars that the newspaper first acquired political influence. One of these, published in November 1641, under the title of *Diurnal Occurrences, or the Heads of Several Proceedings in both Houses of Parliament*, is noticeable as the first which furnished a report of the proceedings in Parliament. The other papers which followed this were the *English Post*, *England's Memorable Accidents*, *The Kingdom's Weekly Intelligencer*, *The Spy*, *The Parliament's Scout*, *The London Post*, *The Country Messenger*, and were most of them published weekly. In Cromwell's time the principal journals were the *Mercurius Politicus* and the *Public Intelligencer*. The publication of newspapers without license was prohibited in the reign of Charles II, and an office was created called Licenser of the Press. Advertisements first appeared in English newspapers in 1652. The first copy of the *London Gazette* was issued 7 Nov. 1665 at Oxford, whither the court had retired in consequence of the plague then raging in London. It has since been uninterruptedly published twice a week as an official court circular. The first London daily paper was published in 1709 under the name of the *Daily Courant*. At this time appeared Defoe's journal, the *Review*. The first number of the *Tatler* was published on 23 April 1709, and of the *Spectator*, on 1 March 1711. Though not properly newspapers in the modern sense of the term, their early numbers contained general news in addition to their other literary matter. In 1712 a tax or stamp-duty was imposed by the government of a half-penny on papers of half a sheet or less, and a penny on papers of a single and above a half sheet. The *London Daily Advertiser* first appeared in 1726, and became afterward celebrated by the publication of the famous "Letters of Junius" (q.v.). The *Morning Chronicle* appeared in 1769 and the *Morning Post* in 1772. The *Times* was first commenced 18 Jan. 1785, under the name of the *London Daily Universal Register*, which was afterward superseded by that of the *Times* on 1 Jan. 1788. It was ably conducted from the first by Mr. Walter, who in 1803 transferred the management to his son. The *Daily News* appeared in 1846, the *Daily Telegraph* in 1855, and the *Daily Standard* in 1857. Others of later establishment are the *Echo*, *Graphic*, *Mail*, *Pall Mall Gazette*, *Westminster Gazette*, etc. The provincial English press began with the *Norwich Postman*, published in 1706, and followed by the *Norwich Courant* in 1714, and the *Weekly Mercury, or Protestant's Packer* (at Norwich) in 1720. The *Worcester Postman* appeared in 1708, the *Newcastle Courant* in 1711, the *Kentish Post* in 1717 and the *Leeds Mercury* in 1718.

Ireland and Scotland.—The first newspaper published in Ireland was the *Dublin News-Letter*, in 1685, followed by the *Dublin Intelligencer* in 1690. The *Belfast News-Letter*, still flourishing, first appeared in 1737. The *Freeman's Journal* commenced in 1763. In Scotland, on 31 Dec. 1660, appeared at Edinburgh the first number of the *Mercurius Caledonius*, which had an existence of only three months. The *Edinburgh Evening Courant* was started in 1718. The *Caledonian Mercury* commenced in 1720 and existed 150 years. The *Edinburgh Gazette* dates from 1699. The first paper published in Glasgow was the *Glasgow Courant*, on

11 Nov. 1715, followed by the *Glasgow Journal* in 1729. The *Edinburgh Scotsman* was first issued in 1817 and the *Glasgow Herald* in 1782.

France.—The first French newspaper, the *Gazette de France*, appeared in 1631, edited by Theophraste Renaudot, a physician, who had been in the habit for some time previously of presenting to his patients a printed account of the various occurrences of the day. The *Gazette* had a most successful career and existed until 24 Aug. 1848, when it was suspended. Two weeks later it was resumed under the title of *Le Peuple Français*, which title was again altered to *L'Etoile de la France*. The *Gazette Burlesque*, a newspaper in verse, was commenced in 1650, under the management of the poet Jean Loret. The *Mercure Galant* was started by Donneau de Visé in 1672 and under the title of the *Mercure de France*, to which it was changed in 1717, continued to exist until 1853. After the Revolution a host of new papers appeared. Among these were the *Chronique de Paris*, the *Orateur du Peuple*, Herbert's *Père Duchesne* and *Ami du Peuple*. Of all the newspapers, however, commenced at this eventful period, the only ones which have survived are the *Journal des Débats* and the *Moniteur*. Under Napoleon the press was subjected to a rigid censorship, which was continued until 1819. During the reign of Louis Philippe appeared *La Presse* and *Le Siècle*, both of which commenced in 1836. Since that date the growth of the newspaper press in Paris has been rapid. In 1903 over 1,400 newspapers were regularly published in Paris alone, some 60 of these being daily political organs. The most important of all is the *Temps*, with politics of moderate republicanism. *Le Petit Journal*, a cheap popular journal, has a circulation of over 1,000,000 daily.

Germany.—Egenolf Emmel, sometimes called the father of journalism, established at Frankfort in 1615 *Die Frankfurter Oberpost-amszeitung*. A second journal was commenced at Hildesheim in 1619 and a third at Herford in 1630. At the end of the 17th century there were at least 30 daily newspapers in Germany. The *Hamburgischer Correspondent* appeared in 1714 as a continuation of the *Holsteinische Zeitungscorrespondance*, established in 1712. It was the first German newspaper which received news of foreign affairs from correspondents resident abroad. The *Allgemeine Zeitung* was published in 1798, and soon rose to the highest position in German journalism. Other important journals are the *Norddeutsche Allgemeine Zeitung*, the *National Zeitung*, the *Neue Preussische Zeitung*, the *Volks-Zeitung*, the *Vossische Zeitung*, the *Kölnische Zeitung*, etc.

Russia.—The first journal in Russia appeared in 1703, and was followed by several others during the first half of the 18th century. The press in Russia is under very strict supervision and thus naturally has but little influence in public affairs. The *Journal de Saint Petersburg*, in French, has a considerable circulation outside of Russia.

Holland and Belgium.—The pioneer newspaper of Holland was first published in 1656. The early Dutch newspapers were distinguished by the accuracy of the information furnished by them. It was not until 1830 that they began to comment on public occurrences, their crit-

icism having been previously directed to items of commercial intelligence. The principal Dutch journals are the *Allgemeene Handelsblad* of Amsterdam, the *Haarlemsche Courant*, the *Journal de la Haye* and *Staats-Courant*, the two latter published at The Hague. Among Belgian papers the *Indépendance Belge*, the *Journal de Bruxelles* and the *Etoile Belge* are distinguished for the ability with which they are conducted.

Australia.—There are nearly 1,000 papers published in Australia. The daily issues are excellent imitations of the London newspapers. The *Sydney Gazette* was established in 1803.

India.—The first Indian newspaper in the English language appeared in Bengal in 1780. There are upward of 300 newspapers published in the various vernacular tongues.

In Turkey the first newspaper appeared in 1795 in French and the first daily journal in Spain was published in 1704. The modern newspapers of Norway, Sweden, Denmark, Italy, South Africa, Switzerland, Portugal, Greece, China, Japan and South and Central America, are of less importance than those of the other countries heretofore mentioned, being largely local in character.

NEWSPAPER SYNDICATE, an association for the furnishing of special news features, generally of a literary nature, to daily and weekly newspapers. See **PRESS ASSOCIATIONS**.

NEWSPAPERS, American. The history of the printing of newspapers in America properly begins on 25 Sept. 1690, for it was upon that date that Richard Pierce, of Boston, issued the first number of what was to have been a periodical publication. Strange as it may seem, however, this first American journalist was endowed with a sense of originality of which even the makers of the modern sensational newspaper might find reason to be proud, for, in his salutatory, he stated that as there were many false rumors being circulated in the town of Boston which were constantly doing a great deal of harm, he requested his readers to furnish him with a list of those persons who were starting such stories that he might advertise them in the succeeding issues of his paper. In other words, his plan was to print a regular weekly list of all the liars in town, a scheme which would certainly have sold many copies of the sheet had not the authorities put an end to the project by promptly suppressing the newspaper. This journal was to have borne the name of "Public Occurrences, both Foreign and Domestic."

As only one issue of this strange newspaper appeared, the historians of journalism have usually failed to mention it, but, instead, have given the credit for the publication of the first periodical to John Campbell, a Scotchman, and

the postmaster at Boston, who issued the first number of *The Boston News-Letter*, on 24 April 1704. It was printed on half a sheet of pot paper, $7\frac{1}{2} \times 12\frac{1}{2}$ inches, with a small pica type, and its entire contents consisted of several extracts from *The London Flying Post*, in relation to the Pretender; the queen's speech to Parliament regarding that subject; a few items of local news; four short paragraphs of marine intelligence from New York, Philadelphia and New London, and a single advertisement—that of the proprietor. This was just 82 years after the appearance of the first English newspaper in London and 99 years after the first newspaper in France. Germany had antedated all other countries, having made several short-lived attempts to establish periodical journals as early as the latter part of the 16th century.

For more than 15 years Campbell had the journalistic field entirely to himself, but, in the latter part of 1719, another paper, called *The Gazette*, was started in Boston and, in 1721, a third was established by James Franklin under the name of *The New England Courant*. In the meantime there had appeared at Philadelphia the first newspaper published outside of New England. It was called *The American Weekly Mercury*, and its first number was issued by Andrew Bradford, the son of William Bradford, 22 Dec. 1719. The first paper to be printed in New York was *The New York Gazette*, established in October 1725, but by 1740 the number of newspapers in the English colonies in America had increased to 11, three of which had been established in Pennsylvania—one being printed in German—one in New York, one in Virginia, one in South Carolina and the remaining five in Boston.

In the beginning the American newspaper was a very small affair, being little more than an abstract of such papers as might chance to arrive from Europe on or about the date of publication. In fact, little change was made in them until after the time of the Revolution when the political agitators found it convenient to make use of them in presenting their appeals to the people. It was largely for this purpose that the first daily newspaper, *The American Daily Advertiser*, was established in Philadelphia by Benjamin Franklin Bache, in 1774. During the time that the seat of government was at Philadelphia, it was this paper that was used by Jefferson to oppose the Federal section of Washington's administration as well as all measures which originated with Hamilton or his friends. In 1802 Zachariah Poulson became its proprietor and the name which he gave to it, *Poulson's Advertiser*, was retained until 1839, when it was consolidated with *The North American*.

The second daily newspaper was *The New York Daily Advertiser*, first issued on 1 March 1785, by Francis Childs and Company. About a year later, 20 July 1786, the first newspaper appeared west of the Alleghany Mountains. It was published at Pittsburgh, Pa., and was called *The Gazette*. During the early post-Revolutionary days, Alexander Hamilton's special organ was *The United States Gazette*, a paper established in New York in 1789, by John Fenno, of Boston.

The territory comprised within the New England States had no permanent daily newspaper until 3 March 1813, when the Boston

Daily Advertiser was started by William W. Clapp. Prior to that time two distinct attempts to establish such papers had been made. As early as 6 Oct. 1796, Alexander Martin, an Irishman, started *The Polar Star*, which lived about six months. It was followed, 1 Jan. 1798, by Caleb P. Wayne's *Federal Gazette*, which ceased publication in less than three months. Of the hundreds of papers started in New York between 1725 and 1827, when the first number of *The Journal of Commerce* appeared, only two now survive, *The Commercial Advertiser*, now better known as *The Globe and Commercial Advertiser*, and *The Evening Post*.

The history of the penny newspaper dates from 1830, the idea having been suggested by the *Illustrated Penny Magazine*, first issued in London during that year. During the next few years, therefore, several similar attempts to introduce cheap papers were made in the United States, notably at Philadelphia and Boston. As these publications were always as small as they were cheap, however, they were but short-lived, and it was not until 1 Jan. 1833, when the price of *The Morning Post* was reduced to one cent by its publishers, Dr. Shepard, Horace Greeley and Francis V. Story, that any pretentious effort was made to print a cheap newspaper. Although this experiment was not a success its failure was due to causes other than that of the price, so, when Benjamin H. Day established the *New York Sun*, 3 September of the same year, he also fixed its price at one cent and the day of the cheap press had come.

DEVELOPMENT OF AMERICAN JOURNALISM FROM 1775 TO 1915.

(A) Ayer's American Newspaper Annual.

* Tri-weekly.

† Includes bi-monthlies and tri-weeklies.

Following are the 10 oldest newspapers of the United States which remain in existence in 1916:

Portsmouth, N. H., <i>New Hampshire Gazette</i> , established.....	1756
Newport, R. I., <i>Mercury</i>	1758
Windsor, Vt., <i>Journal</i>	1763
Hartford, Conn., <i>Courant</i>	1764
New Haven, Conn., <i>Journal-Courier</i>	1766
Philadelphia, Pa., <i>North American</i>	1771
Baltimore, Md., <i>American</i>	1773
Alexandria, Va., <i>Alexandria Gazette</i>	1784
Augusta, Ga., <i>Chronicle</i>	1785
Hudson, N. Y., <i>Gazette</i>	1785

The colonial newspapers devoted most of their small space to foreign affairs, copying from and reflecting the style of the London papers. Local matters were considered too well known to be worthy of mention. The arriving and sailing of vessels and sometimes the comings and goings of stagecoaches, with a few advertisements, mostly about slaves and apprentices, are about the only sort of local chronicles that can be found in the papers prior to 1750. Sometimes letters or parts of letters from people in adjoining towns were printed, but the rule seems to have been to regard as most important the things that were farthest away.

Between 1750 and 1760 there developed a style of vituperative journalism that prevailed largely until about 1833. The idea of freedom of the press had taken strong root in the American mind, and the early disposition was to use the newspapers to ventilate all sorts of animosities, but mainly political squabbles growing out of the competitions of office seekers. The press in the early days of the Republic was mainly partisan and secured most of its support from politicians. Advertising had not yet developed, and subscribers were few. Paper and printing were expensive, so that there was little to be made by running a newspaper. In fact, most of the journalists of the early days seem not to have depended upon their papers for a living, but to have run them as side issues. Under such conditions it is not surprising that space came to be given up largely to minor political squabbles and windy communications from writers hiding under such *nom-de-plumes* as "Vox Populi," "Veritas," etc.

There were no systematic attempts at news-gathering. Editors took their choice of what interested subscribers sent in, with never a thought of reporting important gatherings or conventions. It was not until 1833 that the first real American newspaper appeared in the *New York Sun* and the success of its policy of publishing the news instead of devoting its columns to the editor's personal and often eccentric opinions upon political matters was so immediate that it was soon followed by many rivals. Most notable of these was *The Herald*, first issued by James Gordon Bennett in 1835, which promptly took the lead. There had previously (1801) been established in New York *The Evening Post* (which William Cullen Bryant began to edit in 1828), and *The Journal of Commerce*, which dates from 1827.

Bennett was a natural reporter and gathered two or three times as much news as the *Sun*, and really laid the foundations of the modern school of American journalism. He was the first to print financial news, to discuss theatres and plays, to write up the happenings in clubs and social life and to give the talk of the street. He was also the first to attempt a prompt report of a big fire, with a picture of the burning building in 1836. Dana and Bryant showed themselves great editors, but Bennett outclassed all his contemporaries in business management, gathering the most news, both local and foreign, and getting it quickly on the street. He was also the first to develop a considerable line of advertising. He was the first to demand larger and faster printing presses and to issue the "triple sheet" of 12 pages, the progenitor of the modern multiple page newspaper.

In 1841 *The Tribune* entered the New York field, with Horace Greeley as editor, and if Bennett taught the others how to do business, to Greeley, Dana and Bryant must be awarded the credit of establishing the strong editorial utterances which have ever since been characteristic of the American press. Abandoning the vituperation of earlier journalists, these men, all gifted scholars, taught the growing newspaper editors of America how to write and how to edit newspapers so as to command the respect of their fellow-men, even when they disagreed with the editorial policy or conclusions.

The New York *Times* came in 1851, with Henry J. Raymond, an admirable reporter and able writer, worthy of his colleagues.

Other great newspapers and editors of the antebellum days were: The Springfield (Mass.) *Republican*, started as a weekly in 1824 and made a daily in 1844 and attaining national celebrity through the genius of Samuel Bowles. In 1830 The Boston *Transcript* appeared and the Detroit *Free Press* in 1831. The Philadelphia *Inquirer* dates from 1829. The Philadelphia *Public Ledger* was first issued in 1836 and under the management of George W. Childs easily led the press of Pennsylvania. The Baltimore *Sun*, New Orleans *Picayune* and Milwaukee *Sentinel* were all born in 1837. The Brooklyn *Eagle* first saw the light in 1841. The Cincinnati *Enquirer* in 1842 and the Cleveland *Plain Dealer* in 1843. The career of the Boston *Herald* began in 1846. The Chicago *Tribune* and Milwaukee *Wisconsin* were founded in 1847 and in 1848 the Cleveland *Leader* appeared and was brought into prominence by Edwin Cowles. The Saint Louis *Post-Dispatch*, over which Murat Halstead presided, was born in 1851, the same year as the New York *Times*. The first great paper founded on the Pacific Coast was the San Francisco *Call*, dating from 1856. The New York *World* did not appear until 1860 and it was along in the eighties before it received the inspiring guidance of Joseph Pulitzer, great editor and keen business man.

Prior to 1810 the circulation of the most widely read daily newspaper did not exceed 900 copies, while there were few publications, either weeklies or semi-weeklies, that could boast of a larger circulation than that of 600 copies. There were about 25 dailies in 1810, issuing 310 times a year; 36 semi-weeklies; seven tri-weeklies and 290 weeklies, the aggregate circulation for the

when the total products of the newspaper and periodical industry of the country was stated to be \$232,993,094, and when there were 108,672 persons employed in this business. During this year the amount received from advertising was \$148,534,392, while the amount from subscriptions and sales was \$84,438,703. The above table is interesting as showing the steady development in number and circulation of the industry of daily paper making in America.

Newsgathering.—To attempt to tell the story of the growth of the American newspaper without relating some particulars in regard to the wonderful feats which it has from time to time performed would be to give but a superficial view of the subject. Prior to the days of the telegraph the daily press had great difficulty in obtaining its information about current events in other parts of the country. To offset this disadvantage they adopted three methods of quick communication. One was by pony express; another was by carrier pigeons, and, when steam had been sufficiently developed to make fast traveling by rail or steamboat possible, special trains and boats were frequently chartered for special occasions. The New York *Herald* and the New York *Journal of Commerce* were the first papers to own swift sailing yachts which were used to obtain early information from incoming European vessels, while A. S. Abell, of the Baltimore *Sun*, established his own overland express between New Orleans and Baltimore. This consisted of 60 blooded horses, housed at conveniently located relay stations, and the project was so successful that, during the Mexican War, he not only beat all the other newspapers in getting news, but he secured his information so far ahead of the government's own dispatches that he was able to advise the officials at Washington of important events sometimes more than 30 hours before the reports of the happenings had been received at the War Office. Another instance of conspicuous enterprise was shown by Henry J. Raymond. While a reporter for the New York *Tribune*, he was sent to Boston to report a notable speech by Daniel Webster. Returning by boat, he arranged to have the necessary composition frames and cases erected in his room, that, as fast as he could write, the sheets might be put into type, so that all were ready for publication the instant he reached the office.

In 1846, when the entire country was so greatly excited over the Oregon boundary dispute with Great Britain, several of the newspapers combined to send a swift pilot boat to England. There all the important news was obtained; the boat returned as quickly as it went, and the American people were provided with the information they craved many days before it could possibly have arrived if it had come by the ordinary channels, the slow-sailing vessels of that day.

As so much enterprise was shown by newspaper publishers at a time when the means of quick communication were few and costly, it was but natural that they should have hailed the steam railroad and the electric telegraph with delight. During the 10 years between 1840 and 1850, the period in which these inventions were first generally extended, the circulation of the American papers increased more than two-fold.

YEAR	Number of daily papers published	Total circulation per issue
1850.....	254	758,454
1860.....	387	1,478,435
1870.....	574	2,601,547
1880.....	971	3,566,395
1890.....	1,610	8,387,188
1900.....	2,235	15,102,156
1910.....	2,470	*23,000,000
1915.....	2,494	*29,000,000

* Estimated.

year being estimated at considerably less than 2,000,000 copies, while the value of the paper used could not have been in excess of \$45,000. Compare those figures, therefore, with these from the last available United States census,

Samuel Toplift of Boston was the first systematic gatherer of foreign news in the United States. For 30 years, beginning about 1820, he met the European boats in Boston harbor, and brought the news to the Exchange Coffee House, whence it was forwarded to New York by pony express. In 1848 seven of the large New York daily paper owners combined forces for gathering news outside of the New York field, and the Associated Press was thus formed. In the course of time smaller news-gathering associations were formed by groups of newspapers in various localities. The New York Associated Press gathered the foreign and Washington news, and exchanged its budget of news with these smaller associations, thus covering the entire field. They dominated the news field for many years, and sometimes refused to serve newspapers, and did not serve other-newspapers to their satisfaction. Competition arose in the United Press and the Western Press Association. A few of the more wealthy owners of the Associated Press then purchased a controlling interest in the United Press, and thus stopped competition, except that of the Western Association. These two associations ran in opposition for a few years, and then Melville E. Stone, manager of the Western Association, convinced all parties that conditions were wrong, and that there should be no private ownership of newsgathering. Thereupon the present Associated Press was born, as a New York corporation, in 1900, with conditions that enable any newspaper to come in, and exercise a vote in the control. It had, in 1916, a membership of about 900 newspapers, and expended in the vicinity of \$4,000,000 a year for news.

Owing to the high rates at first charged for telegraph and cable messages the papers of those days did not get the almost unlimited news service which they receive to-day. Even as late as 1879 the night rate from California to Boston was 10 cents a word; between Chicago and Boston it was five cents a word, and between Washington and Boston, two cents a word. Since that time the rates have been reduced fully 75 per cent. The original cable rate was \$100 for 20 words, whether served to newspapers or to the general public, while the rate to newspapers is now but 10 cents a word, either for day or night service.

The result of the high tolls was shown in the compact dispatches published by the newspapers of that day. For example, when the *America* won the international yacht race, 22 Aug. 1851, no report of the event was received by any American paper until 4 September, when the news came in the form of a dispatch from Halifax. On this day the report in the *New York Sun* contained about 500 words, the *Tribune* used but 250 words about the contest and the *Evening Post* was content with 200 words. So, too, when Brooks assaulted Sumner, the senator from Massachusetts, in 1854, the longest report sent to any Boston paper comprised less than half a column, and this was printed quite inconspicuously at the bottom of the page. In 1860, when Lincoln was nominated for the Presidency, at Chicago, one operator was able to send out all the press matter that was offered to him, while, at recent conventions, the hundred and more operators

have had all they could do to handle the millions of words of descriptive matter filed with them by correspondents representing every newspaper of prominence in the country. When these facts are remembered, however, it does not seem so strange that the aggregate number of words of press matter that went over the Western Union wires in 1879 was but 28,000,000, whereas the total number of words contained in press specials handled by the same company in recent years has been no less than 10 times as great.

Scarcely more than 40 years ago some of the most progressive journals in this country depended solely upon boys to carry their papers to their subscribers, while larger lots, the papers intended for dealers, were trundled through the streets on wheelbarrows. To-day all the newspapers have their own systems of fast delivery wagons, and the most progressive publishers charter "special" trains, not only for their Sunday editions, but frequently for other occasions during the year.

The growth of the Sunday newspaper dates from the Civil War, but it was many years after the conclusion of that struggle before the large Sunday editions began to make their appearance. In fact, it was only in 1870 that one of the leading papers in Boston increased the size of its Sunday issue from four to eight pages, and, strangely enough, the change met with all kinds of adverse criticism. During the next few days many of the subscribers to this journal called at the office, to protest that the new paper was much too large, and this same criticism has continued as the great Sunday papers have steadily increased in size.

In 1916 there were 10,929 cities and towns in the United States having newspapers. New York City led with 981, and New York State with 2,121; Illinois had 1,826, Pennsylvania 1,358, Ohio 1,128 and Texas 1,081; New York State had 208 dailies and 1,100 weeklies, Illinois 181 dailies and 995 weeklies, Pennsylvania 212 dailies and 840 weeklies, Ohio 172 dailies and 715 weeklies, Texas 98 dailies and 864 weeklies. No other State had as many as 1,000 newspapers. The Southern States had 4,131, the Mid-Western States 5,013, the Western 6,349, and the Pacific Slope States 2,079.

Classification of Papers.—While the newspaper directories and census reports class all sorts of publications together, and they are included in all the totals here given, it should be understood that many of the publications referred to are no longer generally known as newspapers, the title magazine being chosen by many monthlies and periodicals, by many weeklies, bi-monthlies, monthlies, etc. The first United States newspapers were mostly weeklies, and scarcely entitled to be called newspapers, because they did not begin to systematically gather news until after 1830. When the public came to appreciate what real news was, the daily newspapers experienced a rapid growth, and in 1916 there were 2,494 of them, more than in any other country on the globe. Their issues of six times a week represent a much greater volume of circulation advertising and general business than the 16,000 weeklies, the majority of which are what are termed country newspapers, retailing the minor happenings of the small towns, with their social gossip, interesting mainly to

after the dissolution, it was given to Sir John Byron the Little, and is celebrated in connection with Lord Byron, the poet, who made the semi-ruinous edifice his home in 1808, but sold it in 1818. The abbey has since been restored, and has many carefully preserved relics of the poet. Consult Irving, 'Abbotsford and Newstead.'

NEWT, nūt, a small tailed batrachian of the genus *Diemyctylus*, *Triton*, or a related genus, usually classed under the *Salamandrinae*, but sometimes considered to constitute a distinct family, under the name *Pleurodelidae*. Newts are sometimes also called elfs or tritons, and the name is often loosely applied to salamanders of other genera not closely related. Among technical characteristics of the newts in general are the bony carpus and tarsus, the bony ball-and-socket joints of the vertebræ, the bony post-frontal-equamosal arch of the skull and the narrow bands of palatine teeth. The tongue is generally very small. The species are more strictly aquatic than most salamanders, and the males of most species undergo remarkable seasonal changes in the development of high dorsal crests, papillæ or other appendages on the arms and elsewhere, and of brilliant colors. About 20 species belonging to this group of genera are known, of which more than half are European, several Asiatic and only two North American, while none have been found elsewhere. The eastern American species (*Diemyctylus viridescens*), of which a quite distinct variety occurs in Texas and Mexico, is abundant throughout the Eastern States, and extends into Canada. It may be distinguished by the rather narrow arched head marked with a pair of longitudinal keels, and the handsome greenish red color of the back, the pale yellow below and the row of conspicuous scarlet, black-bordered spots on each side. In the adult stage just described this animal is about three and one-half inches long and completely aquatic. A terrestrial form is somewhat smaller, lacks the dorsal crest altogether, has a rougher skin and a bright vermilion color. This is the pretty little creature common in Eastern woods, which later returns to the water and assumes the greenish garb. Newts are chiefly nocturnal, and when abroad swim actively, not merely crawling on the bottom in the manner of most salamanders. They feed on all kinds of aquatic larvæ, worms, small mollusks and crustaceans, and are very voracious. During the breeding season in the spring the male develops a broad cutaneous fin, richly provided with sense organs on the back and tail, and becomes otherwise modified. The fertilized eggs are deposited singly, each in a gelatinous capsule whose adhesive nature permits of their attachment to water-plants, some of the leaves of which are drawn about each egg. The larvæ are strictly aquatic and possess three pairs of external gills, but after metamorphosing, leave the water and assume the red terrestrial phase, when they live in the woods under stones and logs, appearing at night or during rain. This stage lasts for several years, when they seek the water either in the spring or fall and soon acquire the adult color and characteristics. Whether or not they can again enter the red phase by leaving the water is not certainly determined. Like frogs, newts swallow the skin after molting, which appears to take place most readily while the animal is immersed in water.

The Pacific newt (*Diemyctylus torosus*) is nearly twice as large, and is further distinguished by the wide, flat keelless head, and brown, unspotted color. It is very abundant in California, and ranges from the southern part of that State to Alaska. Its habits are essentially similar to those of the Eastern species. It feeds on earthworms, snails, slugs, insects, and its own sloughed skin, eggs and young. In this species the eggs are deposited in clumps.

The numerous European species present many interesting differences in detail in habits, especially in the mode of reproduction. Some of them live habitually away from the water and migrate long distances to it in the spring, and one species is remarkable from the fact that the ribs penetrate the skin. All of the newts make very interesting and satisfactory aquarium pets.

J. PERCY MOORE,
University of Pennsylvania.

NEWTON, nū'ton, Alfred, English ornithologist and zoologist: b. Geneva, 11 June 1829; d. London, 7 June 1907. He was educated at Magdalene College, Cambridge, of which he was travelling Fellow 1854-63, Fellow in 1877 and till his death professor of zoology and comparative anatomy. He took a prominent part in urging bird protection by legislation; traveled in Lapland, Iceland, West Indies, North America, the Pacific and Spitzbergen; edited *The Ibis* (1865-70) and the *Zoological Record* (1870-72); contributed the ornithological articles in the 9th edition of the 'Encyclopædia Britannica'; and greatly advanced the study of the comparative anatomy of birds. He wrote 'The Zoology of Ancient Europe' (1862); 'Ootheca Woolleyana' (1864-1902); 'Zoology' (1894); and a 'Dictionary of Birds' (1893-96).

NEWTON, Sir Charles Thomas, English archæologist: b. Bredwardine, Wales, 16 Sept. 1816; d. Margate, 28 Nov. 1894. He was educated at Shrewsbury School and at Christ Church College, Oxford, and was assistant in the department of antiquities in the British Museum, 1840-52. He became vice-consul at Mytilene in 1852 and acting consul at Rhodes in 1854; discovered the tomb of Mausolus at Halicarnassus and the famous bronze serpent of Delphi at Constantinople and after a year as consul at Rome in 1861 became keeper of Greek and Roman antiquities in the British Museum, being the first incumbent of this post and holding it until December 1885. During this term he furthered archæological excavations in Ephesus, Priene, Smyrna, Sicily, Cyprus, Cyrene and Rhodes and procured for the British Museum the Farnese collection, the two Castellani collections and those of Pourtales and Blacas. From 1880 to 1888, Newton (who was knighted in 1887) was professor of classical archæology in University College, London; to his work there and in the British Museum is largely due the revival of English interest in classical antiquities. He wrote 'Method of the Study of Ancient Art' (1850); 'History of Discoveries at Halicarnassus, Cnidus and Branchidæ' (1862-63); 'Travels and Discoveries in the Levant' (1865); and 'Essays on Art and Archæology' (1880).

NEWTON, Gilbert Stuart, English painter: b. Halifax, Nova Scotia, 20 Sept. 1794; d. Chelsea, England, 5 Aug. 1835. His mother was sis-

ter to Gilbert Stuart, the American portrait-painter, his father an officer in the British army and he went eventually to England after visiting Italy and France (1817). After studying at the Royal Academy he exhibited regularly both in the Royal Academy and the British Institution from 1818 to 1833. He was elected Royal Academician in 1832. The last three years of his life he was confined in a private asylum for the insane. His pictures, which are finely colored, are mostly domestic scenes, are anecdotic in motif and he especially excelled in the portrayal of feminine beauty of the English type. His best works include 'The Gentle Shepherd'; 'The Dutch Girl' (both of which were engraved); 'Porcelain and the Doctors'; 'The English Girl'; 'Olivia's Return'; 'The Forsaken.' Specimens of his work are in the possession of the New York Historical Society and the Metropolitan Museum, New York. Sir Walter Scott, Tom Moore and Washington Irving sat for portraits to him.

NEWTON, Henry Jotham, American manufacturer and chemist, inventor of the dry-plate photographic process; b. Hartleton, Pa., 23 Feb. 1823; d. from street railroad accident, New York, 23 Dec. 1895. At 20 he was a partner in the firm of Wittlesey Brothers, piano-makers, Salem, Conn., whom he left six years later to form the New York firm Light and Newton; this new company greatly improved the manufacture of pianos. Newton was later connected with the Bradburys in the piano trade; in 1884 he became president of the Henry Bonnard Bronze Co. His invention of a permanent colloid emulsion and of the other details of the dry-plate process in photography dates from 1875. Educated a Presbyterian, Newton joined the Methodist Church, then the Unitarian and finally allied himself with the Spiritualists. A society formed by him in 1875 for psychical research and of which he was president was, he claimed, the first Theosophical Society, from which Mme. Blavatsky and Henry S. Olcott took the ideas which they falsely proclaimed to be of Indian origin.

NEWTON, Hubert Anson, American astronomer and mathematician; b. Sherburne, N. Y., 19 March 1830; d. New Haven, Conn., 30 Aug. 1896. He was graduated at Yale in 1850 and in 1855 became professor of mathematics there. He spent one year in foreign study and for the rest of his life lived quietly in New Haven. He was far better known as an astronomer than as a mathematician because of his remarkable researches as to meteors and meteoroids, undertaken to verify Olmsted's hypothesis that meteors were the more visible portions of a great stream of bodies with a fixed orbit about the sun and this hypothesis he proved correct by a brilliant and painstaking series of mathematical computations. In 1861 he superintended the work of the Connecticut Academy of Arts and Sciences in relation to the meteors of August and November and prepared a celestial map for the use of the investigators. He wrote on meteors for several encyclopædias and published most of his original papers on that subject in the 'Memoirs' of the National Academy and in the *American Journal of Science*, of which he was long editor. The National Academy awarded him the Smith gold

medal for his work on meteors. Newton did much to introduce the study of the metric system into the public school curriculum; was an authority on the theory of transcendental curves and wrote various tables for life insurance companies. He was a simple, genial, modest man and deeply interested in the material advancement of Yale College.

NEWTON, Sir Isaac, English mathematician and natural philosopher; b. Woolsthorpe, Lincolnshire, 25 Dec. 1642; d. Kensington, 20 March 1727. He was sent at an early age to the village school and in 1654 to the free grammar school of Grantham. He was entered at Trinity College, Cambridge, in 1660. He had the good fortune to find in the celebrated Dr. Barrow, professor of Greek (1660-63) and from 1663 Lucasian professor of mathematics, an able teacher and fast friend. He appears to have found particular interest in Wallis' treatise, 'Arithmetica Infinitorum.' He was graduated in 1665. While absent from Cambridge in 1665-66, during the plague, he discovered the binomial theorem (q.v.) and the direct and inverse methods of fluxions (q.v.)* (that is, differential and integral calculus); computed the area of the hyperbola; and first turned his attention to the subject of gravity. The familiar story, first given by Voltaire, is that the fall of an apple led him to reflect on the nature of that remarkable principle which attracts bodies to the centre of the earth. He considered that if the moon was retained about the earth by terrestrial gravity, the planets, which move round the sun, ought similarly to be retained in their orbits by their gravity toward that body. Having determined the law of the gravity of the planets toward the sun he endeavored to apply it to the moon, that is, to determine the velocity of her motion round the earth by means of her distance, as settled by astronomers, and of the intensity of gravity, as shown by the fall of bodies at the earth's surface. To make this calculation it was necessary to know exactly the distance from the surface to the centre of the earth but unfortunately at that time there existed no correct measure of the earth's dimensions. Newton was obliged to employ the imperfect measures then in use, and found that they gave for the force which retains the moon in her orbit a value greater by one-sixth than was allowed by observed facts. This small difference seemed to his cautious mind a strong proof against his bold conjecture, and, furthermore, Newton was then unable to show that a homogeneous attracting sphere behaved as if all its mass were situated at its centre. He imagined that some unknown cause modified, in the case of the moon, the general law of gravity indicated by the motion of the planets. Yet he did not abandon his leading notion, but determined to wait till study and reflection should reveal to him this supposed unknown cause. In 1667 he returned to Cambridge as Fellow of Trinity. In the year 1668 Mercator published his 'Logarithmotechnia,' in which he had obtained the area of the hyperbola referred to its asymptotes by expanding its ordinate into an infinite series, which was the main secret of Newton's method. Barrow showed this work to Newton, who im-

*It now appears that the main credit for the invention of the calculus should go to Dr. Barrow, Newton's teacher.

mediately gave him his own treatise, but did not yet publish.

In the course of 1666 his attention had been accidentally drawn to the phenomena of the refraction of light through prisms. His experiments led him to conclude that light, as it emanates from the radiating bodies, is not a simple and homogeneous substance, but that it is composed of a number of rays, endowed with unequal refrangibility and velocity and possessing different coloring properties. He made the mistake of supposing it to be impossible for a compound prism or lens to be achromatic. More than two years elapsed before he returned to his researches on this subject; but in 1669, having been appointed Lucasian professor of mathematics, and preparing to lecture on optics, he endeavored to mature his first results, and composed a complete treatise, in which the fundamental properties of light were unfolded, established and arranged by means of experiments alone, without any mixture of hypothesis—a novelty at that time almost as surprising as these properties themselves.

In 1672 Newton was chosen a Fellow of the Royal Society, to which he communicated a description of a new arrangement for reflecting telescopes, which rendered them more convenient by diminishing their length without weakening their magnifying powers, and soon after, the first part of his labors on the analysis of light, in which he advocated the material theory (that is, that light consists of small particles shot out by a luminous object), the society appointed three members to study it fully and report upon it. Hooke undertook to draw up the report. Instead of discussing the new facts as presented by the experiments of Newton, he examined them merely in relation to his own hypothesis—now known as the undulatory theory, and accepted as the true one—and concluded by allowing whatever appeared reconcilable with his own hypothesis, and by advising Newton not to seek any other explanation of the facts. Newton in reply adduced new experiments confirming his material (or corpuscular) theory and refuted the objections to the production of whiteness by the mixture of all the rays. He addressed another paper (1675) to the Royal Society, completing the account of his results and of his views on the nature of light. This treatise, united with his first paper on the analysis of light, afterward served as the base of the great work, 'Treatise on Optics' (1704) in which, however, the experimental investigation of the phenomena is more extensive and more strictly separated from all hypothesis. It is now known that Newton was wrong, and that light results from wave-motion in a pervading medium called ether. But Hooke's explanations were vague, and his theory remained untenable until the discovery, a century later, of the principle of interference (q.v.). In 1679 Newton had occasion to write to Hooke about a system of physical astronomy on which the Royal Society had asked his opinion. Hooke and Newton held conflicting opinions, and Newton, having examined by mathematical calculations a position maintained by Hooke, found that an attractive force, emanating from a centre, and acting inversely as the squares of the distances, would produce motions exactly resembling the planetary motions both in re-

gard to the form of the orbit and the velocity of the body at each point. This was the secret of the system of the world; but it still remained to account for the discordance of the moon's motion, which had before (1665) embarrassed Newton. But in 1684 he learned the results of a new measurement of the arc of a meridian. Two years were spent in following up the consequences of this discovery, and preparing his immortal work, 'Philosophiæ Naturalis Principia Mathematica'; but it was not till 1686 that he concluded to present his work to the society, and it was printed in 1687 at the personal expense of Halley, the secretary. Newton's teachings were introduced at Cambridge in 1699 and at Oxford in 1704, but were not admitted by the French scientists for half a century.

In 1687 Newton was one of the delegates sent by the University of Cambridge to maintain its rights before the High Commission Court when they were attacked by James II, and in 1689 he was elected by the university to the Convention Parliament, but never distinguished himself in that body. He had always taken great interest in chemistry, and constructed a small laboratory for prosecuting his investigations, and seems, after the publication of the 'Principia,' to have devoted almost his whole time to them.

In 1696 he was appointed warden of the mint, a general recoinage having then been undertaken. In this office he rendered essential service, and in 1699 was made master of the mint. In 1701–02 he again sat in Parliament for his university; in 1703 he was chosen president of the Royal Society; and in 1705 was knighted by Queen Anne. In 1704 he gave to the world his 'Optics,' which contains all his researches on light. Later works were his 'Arithmetica Universalis' (1707; more complete 1712); 'Methodus Differentialis' (1711); and his 'Analysis per Equationes Numero Terminorum Infinitas' (1711); 'Chronology of Ancient Kingdoms Amended' (1728); and 'Observations or Daniel and the Apocalypse' (1733), an attempt to show the fulfilment of the prophecies. In 1705–12 he was involved in a controversy with Flamsteed; and in 1705–24 in one with Leibnitz as to priority in the discovery of fluxions. The splendid genius of Newton has often been testified to, among many by Macaulay, who declared that in no other person did the demonstrative and inductive faculties ever exist in such perfect co-ordination. His statue, by Roubiliac, stands in Trinity College, Cambridge. Horsley's edition of his works (1779–85), with the 'Opuscula,' collected by Castillon (1744), and his 'Letters,' inserted in the 'Biographia Britannica,' contain nearly all his printed works. Three editions of the 'Principia' were published in his own lifetime; the last reprinted at Glasgow in 1871 by Sir W. Thomson (Lord Kelvin) and Professor Blackburn. The standard 'Life of Newton' is that by Sir David Brewster, who had full access given him to the great mass of Newton's papers (1855; 2d ed., 1860). Consult also Ball, W. W. R., 'Essay on Newton's Principia' (London 1893); De Morgan, A., 'Essays on the Life and Work of Newton' (reprinted Chicago 1914). This latter work contains a bibliography.

SIR ISAAC NEWTON

NEWTON, John, English astronomer and mathematician: b. Oundle, Northamptonshire, England, 1622; d. Ross, Herefordshire, England, 25 Dec. 1678. He was graduated from Oxford University in 1641 and engaged in mathematical and astronomical work, remaining loyal to the king during the Protectorate. After the Restoration he was made king's chaplain in 1661 and became canon of Hereford in 1673. He wrote 'Institutio Mathematica' (1654); 'Geometrical Trigonometry' (1659); 'Introduction to the Art of Logic' (1671); 'Cosmography' (1679), etc.

NEWTON, John, English clergyman: b. London, 24 July 1725; d. there, 21 Dec. 1807. He made several voyages with his father before 1742, was impressed in 1743, deserted and was captured, and was exchanged into a slaver. A life of debauchery was followed by his conversion in 1748; in 1755 he left the sea and was surveyor of tides at Liverpool 1755-60. His religious experiences were deepened by the preaching of Wesley and Whitefield, and after a period of private study he was ordained priest in the Church of England in 1764. From 1764 to 1780 he was curate of Olney, Buckinghamshire, and then became incumbent of Saint Mary Woolnoth, London, where he preached until the year of his death. His evangelical influence was very strong there, and he preached to large congregations. He is best known, however, for his connection with the poet Cowper, who settled at Olney in 1767, and who was kept occupied by the good man in an almost unintermitted round of religious exercises. Newton seems to have foreseen the outcome, and endeavored to provide congenial occupation for the poet in seeking from him contributions to the 'Olney Hymns' which, published in 1779, attained great popularity. Newton received his D.D. from the College of New Jersey (Princeton) in 1792. His sermons were characterized by unction and intensity, but they have no literary value. One of his hymns is the well-known 'Glorious Things of Thee are Spoken.' Among his works are 'An Authentic Narrative of Some Particulars in the Life of John Newton' (1764), an evangelical classic; 'Olney Sermons' (1767); 'Cardiphonia' (1781); 'Apologia' (1789), and the beautiful and touching 'Letters to a Wife' (1793). His memoir edited by Cecil was published in 1808. See COWPER.

NEWTON, John, American military engineer: b. Norfolk, Va., 24 Aug. 1823; d. New York, 2 May 1895. He was graduated from West Point in 1842 and was appointed to the engineering corps. At the beginning of the Civil War he was chief engineer of the Department of Pennsylvania and in September 1861 was made brigadier-general of volunteers. He served with distinction through the war and in 1865 was promoted brigadier-general and major-general in the regular army. He was mustered out of the volunteer service in 1866 but continued in the regular army, and in 1884 was made chief of engineers. He engineered the removal of the obstructions at Hell Gate Channel in the East River, New York; was commissioner of public works in New York, and in 1886 was retired at his own request. In 1887-88 he served as commissioner of public works of New York City,

and in the latter year became president of the Panama Railroad Company.

NEWTON, Richard Heber, Protestant Episcopal clergyman: b. Philadelphia, 31 Oct. 1840; d. 19 Dec. 1914. He was son of the rector of Saint Paul's, Philadelphia, studied in the Philadelphia Divinity School, was assistant to his father (1860-62) and, after a short time in a church at Sharon Springs, N. Y., succeeded his father in Philadelphia, leaving this charge in 1869 to go to All Souls' Church, New York. In 1903 he was appointed preacher to Leland Stanford, Jr., University but soon resigned this position. He was a broad-churchman, and was several times threatened with trial for heresy for the free expression of his views. He took a prominent part in the Congress of Religions held at Chicago in 1893 and was vice-president of the organization of this congress. He wrote 'The Morals of Trade' (1876); 'Womanhood' (1880); 'Philistinism' (1885); 'Social Studies' (1886); 'Church and Creed' (1891); 'Christian Science' (1898); 'Parsifal' (1904); 'The Mysticism of Music' (1915).

NEWTON, Robert Safford, American surgeon: b. Gallipolis, Ohio, 12 Dec. 1818; d. New York, 9 Oct. 1881. After receiving a preliminary education at Gallia College, Ohio, he went to the University of Kentucky, where he received the degree of M.D. in 1841. He practised in Gallipolis until 1845, when he removed to Cincinnati where he made a reputation as physician and surgeon. From 1849 to 1851 he was professor of surgery in the University of Memphis, Tennessee, and in the latter year was called to a similar chair in the Eclectic Medical Institute in Cincinnati. He resigned in 1862 and in 1863 went to New York City. There he helped found the Eclectic Medical College, in which he was professor of surgery from 1865 until his death and of which he was also president from 1875 till his death. Dr. Newton was a successful operator and the inventor of several surgical instruments. He was also engaged in the investigation of cell pathology and made a specialty of cancerous diseases. From 1851 to 1861 he edited and published the *Eclectic Medical Journal* and after he settled in New York he edited the *Eclectic Medical Review* until 1874, when it was merged into the *Medical Eclectic*. He published several books with D. B. Powell, including 'An Eclectic Treatise on Diseases of Children' (New York 1854 and 1880), and was the sole author of 'Pathology of Inflammation and Fever' (1861; new ed., 1867); 'A Treatise on Antiseptic Surgery' (1876) and 'Explorations in Cell Pathology' (1877).

NEWTON, Ill., city, county-seat of Jasper County, on the Embarras River and on the Illinois Central Railroad, about 100 miles in direct line southeast of Springfield. It is in a productive agricultural region, and in the vicinity of large coal fields. The chief manufactures are dairy products, flour, brick, tile, lumber products, woolen goods, brooms, ice cream and candies, and it has a large cold storage plant. The city carries on an active trade in farm and dairy products, fruit, coal and its manufactures. Pop. 2,108.

NEWTON, Iowa, city, county-seat of Jasper County, on Chicago, Rock Island and

Pacific and the Minneapolis and Saint Louis railroads, about 30 miles, direct line, east by north of Des Moines the capital of the State. It is the commercial centre of a rich agricultural section in which considerable attention is given to stock-raising. There are 28 factories, their annual volume of business amounting to \$4,575,000, with a monthly pay-roll of \$100,000. Newton is commonly known as the "Washing Machine Centre of the World." Besides this and worthy of mention are the following manufactured products: flour, agricultural implements, gas engines, tractors, advertising novelties, toys, tile and brick. The city is a beautiful home city, 11 fine churches, six schools, among the finest in the State. Nearly 20 miles of paved streets. The trade is chiefly in manufactured articles, farm products and livestock. The city owns and operates the waterworks, light, power and gas plant. Pop. 6,800.

NEWTON, Kan., city, county-seat of Harvey County, on the Atchison, Topeka and Santa Fé and the Missouri Pacific railroads, about 201 miles southwest of Kansas City and 115 miles southwest of Topeka. It is in the south central part of the State, in the valley of the Arkansas River, one of the most fertile sections of Kansas. It was settled in 1871 and incorporated a city in 1880. The chief manufacturing establishments are flour mills, drill factory, separator factory, creamery, large ice plant and stock yards. It is a division point of the Santa Fé Railroad and has repair shops. The number of railroad employees who are residents of Newton is about 750, and about 200 men are employed in the manufacturing establishments mentioned. There are 15 churches for white people and two for the colored. It is the seat of Bethel College, the only college in America under the auspices of the Mennonite Church (1904). It has a high school, good public and parish schools and a Carnegie library. The three banks have a combined capital of \$175,000. The government is vested in a mayor, who holds office two years, and two commissioners also elected biennially. The majority of the people are native born; the foreign born are Germans, Irish and French. Pop. (1920) 9,781.

NEWTON, Mass., city in Middlesex County, on the Charles River, and on the Boston and Albany Railroad, six miles west of Boston. The area is 18 square miles; the city includes 13 villages. It was settled in 1631 and was part of Cambridge until 1688, when it was incorporated as a town under the name of New Cambridge, which name it retained until 1692; the city charter was granted in 1873. Newton is a beautiful residential city; within its limits is a part of the Metropolitan Park; its own city parks cover an area of about 170 acres. A large cemetery, in a prominent part of the city, contains the graves of many people noted in history. Newton has some manufacturing establishments, chief of which are silk mills, fire-alarm supply works, rubber works, paper-box and curtain factories, printing works, worsted mills and cordage factory. It has the Lasell Seminary for women (1851), the Allen School for boys (1853), Mount Ida School for young women, Boston College (Catholic), Saint John's Industrial School, the Newton Theological Seminary, opened in 1825 under the auspices of the Baptists, and a public library which con-

tains about 94,000 volumes. The prominent public buildings are several beautiful churches, the classical and technical high schools, the elementary and parish schools. Near the site of Waban's Wigwam, where John Eliot began to preach to the Indians, 28 Oct. 1646, stands the Eliot Memorial.

The annual municipal expenditures for maintenance and operation are about \$1,500,000. The chief items of expense are for public schools, \$400,000; for streets, parks, sewers, \$300,000; interest on debt, \$169,000; police department, \$105,000; fire department, \$96,000; municipal lighting, \$61,000; health department, \$43,402; charity, \$38,000. The government is administered under a revised charter of 1902, which provides for a mayor who holds office two years and a board of aldermen consisting of 21 members, three from each ward. The mayor and aldermen appoint or elect the administrative officials, except the school board, which is chosen at a popular election and for a term of three years. The city owns and operates the waterworks. Pop. 46,054. Consult Smith, 'History of Newton.'

NEWTON, N. J., town, county-seat of Sussex County, on the Delaware, Lackawanna and Western Railroad, about 40 miles northwest of Newark. It is in an agricultural region, and in the vicinity are slate quarries. The chief manufactures are roofing slate, silk, paper boxes, shoes and dairy products. It is the seat of the Newton Collegiate Institute and it has the Dennis Library, which contains about 9,000 volumes. Newton is known as a summer resort. The town owns and operates the waterworks. Pop. 4,700.

NEWTON-ABBOT, England, a market-town of Devonshire, 15 miles south of Exeter by the Great Western Railway. It is beautifully placed at the head of the Teign estuary where the Lemon enters. Newton-Abbot was given to the abbot of Tor by William, Lord Brewer, founder of the monastery, in 1196, whence the town gets its name. Newton-Abbot contains some ancient monuments the oldest of which is a tower of the 14th century chapel of Saint Leonard. Two churches, Saint Mary's in Wolborough and All Saints in Highweek, are of Perpendicular style. Saint Mary's, however, contains a Norman font and some heraldic ornaments of the 15th century. Forde House, a valuable Tudor mansion, belonging to the Earl of Devon was visited by Charles I and William of Orange, who was proclaimed king being here in 1688 and who first read his declaration to the people of England at Newton-Abbot market-cross. The town-hall and markets are also interesting. There are important Roman remains in the vicinity. The establishment of large engine works by the Great Western Railway greatly developed local industry, and there is much shipping trade. Fine china and pipe clay are worked near the town and exported to the potteries. Lignite and tin ore are mined. Large agricultural fairs are held here. Pop. 12,500.

NEWTON-IN-MAKERFIELD, England, a town in Lancashire, 15 miles east of Liverpool and 15 miles west of Manchester. The barony belonged to Edward the Confessor and was held by the Banastres from the Conquest to 1286. The township of Newton-in-Makerfield

(Newton-le-Willows) gave its name in Saxon times and in the reign of William the Conqueror to one of the hundreds of Lancashire. There was a market here in 1558. A party of Highlanders were taken prisoners near the town by Cromwell in 1648 and hanged in the woods which is still called Gallow's Cross. Newton is an important railway junction and manufacturing centre. The chief industries are paper making, printing, iron foundries, glass, sugar refining, wagon making, brick making and coal mining. It has a mechanics' institute, a grammar school and a town-hall. Near the town is a fine race course. Races and horse and cattle fairs are held here every summer. A beautiful lake in the town called Newton Mere is covered with pleasure boats in the spring and summer. Newton returned two members to Parliament from 1558 to 1832, when it was disfranchised. Coal is mined in the neighborhood. Near the town is a moated Elizabethan half-timbered house and an ancient barrow. Pop. 16,699.

NEWTON THEOLOGICAL INSTITUTION, theological school founded 1825 at Newton, Mass., under the auspices of the Baptist bodies of New England. Its course covers three years and at its completion the degree of bachelor of divinity is conferred. The library contains 34,000 volumes and the institution has 10 members on the faculty and 81 students. The buildings and grounds are valued at \$400,000; other property controlled by the institution is valued at about \$1,400,000, not including an endowment fund of \$800,000.

NEWTONIAN PHILOSOPHY. See NEWTON, SIR ISAAC.

NEWTON'S RINGS. This is the name given to those colored rings seen when between the surfaces of two plates of glass a thin film of air intervenes. This phenomenon takes its name from its discoverer, Sir Isaac Newton (1642-1727), who describes it in his work on 'Optics' (London 1704). He took two lenses, one convexo-plane, its convex side having a radius of 14 feet, the other equi-convex, with the radii of its surfaces 50 feet, and laid the first with its plane downward on the top of the second, thus producing a thin film of air between the lenses, the film being thinnest near the centre and becoming gradually thicker outward. On slowly pressing the upper lens against the under one a number of concentric colored rings, having the point of contact of the lenses for their centre, appeared and increased in size when the pressure was increased. These rings, or more properly systems of rings, are in this form of the experiment seven in number, and each of them is composed of a number (ranging from eight in the first or smallest ring to two in the outermost) of rings of different colors, the colors, though different in each of the systems of rings, preserving the same arrangement as the colors of the spectrum. Thus, in the second ring the color is violet and the outside scarlet. The colors are very distinct in the first three systems of rings, but become gradually confused and dull toward the outside, till they almost fade away in the seventh system. The centre is deep black. The thickness of the air-film in the centre is about half a millionth of an inch and increases gradually, to nearly one one hundred and

thirty thousandths of an inch, when the colors disappear. Consult Newton, 'Optics' (London 1704); Preston 'Theory of Light' (New York 1894).

NEWTOWN, Conn., town in Fairfield County, 20 miles north of Bridgeport on the New Haven and Hartford Railroad. It owns waterworks and the Beach Memorial Library. Farming is the chief occupation. It is a rich agricultural country and there are many beautiful drives in the vicinity. A fire hose factory is situated here. Pop. 434.

NEWTOWN, N. Y., since 1898 a part of the borough of Queens in New York City; formerly a separate town in Queens County. It was settled in 1652 by people from New England and first called Middleburgh. In 1664 it became a part of Connecticut and was then called Hastings. The following year it came into possession of New York and the name was changed to Newtown. Consult Riker, Jr., 'The Annals of Newtown.'

NEWTOWN, Battle of (29 Aug. 1779), won by Gen. John Sullivan (1740-95). While waiting in the summer of 1779 for the promised return of D'Estaing from the West Indies to co-operate against Canada, Sullivan, commanding 4,000 men, entered the Iroquois Country, or Country of the Six Nations (Mohawks, Oneidas, Onondagas, Cayugas, Senecas and Tuscaroras), to punish and prevent the devastations of the Indian tribes and their English allies. In the little settlement of Newtown, now incorporated in the city of Elmira, New York, a battle of considerable importance was fought on 29 August. General Sullivan defeated several bands of Indians, including a force under Joseph Brant and Sir John Johnson (son of Sir William Johnson), and drove out of the country thousands of Indian warriors and destroyed their villages and crops. Next morning General Sullivan began his march toward Catherine Town, near the southern extremity of Seneca Lake. A monument to General Sullivan now marks the historic spot of the battle. (See SULLIVAN, JOHN; BRANT, JOSEPH). Consult 'Journals of the Military Expedition of Maj.-Gen. John Sullivan against the Six Nations of Indians in 1779, with records of centennial celebrations, prepared by order of the State government' (Auburn, N. Y., 1887), and 'Life of Gen. John Sullivan,' by Oliver W. B. Peabody, in Spark's 'American Biography,' Vol. XIII, p. 135.

NEXT FRIEND, in law, an adult, other than a guardian, who represents in an action another person not legally competent to maintain a suit in his own behalf. The practice originated in England in the time of Edward I. A next friend is not a party to an action but acts solely for another and is considered an officer of the court. In some States a minor may sue through a next friend to compel an accounting by his guardian in case there is some ground for belief that the latter has been guilty of a breach of trust. An action begun by a next friend cannot be terminated or settled otherwise than by consent of the court.

NEY, nā, Michel, Duke of Elchingen, Prince of the Moskva, French soldier: b. Sarre-Louis (Moselle), 10 Jan. 1769; d. Paris, 7 Dec. 1815. He was the son of a cooper and became a

non-commissioned officer of hussars in 1787. He soon attained great distinction for bravery as well as for military capacity, was quarreled over by Kleber and Jourdan as to who should have his services, contributed greatly to the victory of Hohenlinden and obtained the marshal's baton in 1804. He opened the campaign of 1805 against Austria by a brilliant victory at Elchingen, 14 October (whence his title Duke of Elchingen) and brought about the capitulation of Ulm. He occupied the Tyrol and marched on to Carinthia, when stopped in his career by the Peace of Presburg. In 1806 and 1807 he fought at Jena, and after the capture of Magdeburg at Eylau and Friedland, his conduct at the latter earning for him the title of "le brave des braves." In 1808 he maintained his high reputation in Spain. Napoleon recalled him, but kept him at a distance till the commencement of hostilities against Russia, when he received the chief command of the 3d division of the imperial forces. He commanded the centre at the battle of the Moskva, or Borodino, and so distinguished himself as to earn the title of Prince of the Moskva. In the conduct of the retreat, in which he commanded the rear guard, his ability, valor and devotion were conspicuously manifest, and he exerted himself to the utmost to save the wreck of the army. Napoleon and Murat had deserted. In 1813 he decided the victory of Lützen, assisted at Bautzen and Dresden, but was defeated by Bernadotte at Dennewitz. He was now obliged to retire to Torgau, but soon took the field again; chased the Swedes from Dessau and fought at Leipzig and Hanau. When the enemy entered France he disputed every step of their progress. Brienne, Montmirail, Craonne and Châlons-sur-Marne are shining names in the history of his battles.

After Napoleon's abdication, Ney took the oath of allegiance to the king, was made a peer and received the cross of Saint Louis. He enjoyed marked distinction at court and appeared to be entirely devoted to the Bourbons, but was the object of bitter hostility on the part of the returned émigrés. When Napoleon landed on his return from Elba Ney collected a large force, was appointed its commander and with many assurances of his zeal and fidelity to the king marched against the invader. But noticing the desertion of his soldiers and their inclination for Napoleon, he regarded the cause of the Bourbons as lost. He joined Napoleon at Lyons on 13 March and thus opened his way to Paris. Napoleon gave him the command of his left wing, which engaged with the British at Quatre Bras. At Waterloo he led the last charge of the Old Guard and had five horses shot under him. His clothes were full of bullet holes and he fought on foot till night in the midst of the slain. He kept in hiding for a time after the new restoration but was captured, the ultra-loyalists demanded his life and he was tried for treason, sentenced (5 December) to death and shot in the Luxembourg garden. "After the execution," says Lamartine, "bitter shame seized on every soul." It was universally regretted that Ney, the brave, had been chosen to suffer. Consult 'Mémoires du Maréchal Ney' (1833); 'Lives,' by Bonnal (1910) and Rouval (1833); Johnston, C. L. H., 'Famous Cavalry Leaders' (1908); Nollett-Fabert, 'Eloge historique' (1852).

NEYMARCK, nā'märk, **Alfred**, French economist: b. Châlons-sur-Marne, France, 4 Jan. 1848. He was engaged in the banking business in his early years in his native city and was in Berlin in 1866-67. In 1869 he went to Paris and edited a political paper. He soon acquired fame for his knowledge of statistics and economical subjects, became president of the Statistical Society, vice-president of the Society of Political Economy and a member of many important commissions. He was a delegate to the Saint Louis World's Fair in 1904 and was made a Commander of the Legion of Honor. His books include 'Les milliards de la guerre' (Paris 1875-77); 'Colbert et son temps' (2 vols., 1877); 'Turgot et ses Doctrines' (2 vols., 1885); 'Les valeurs mobilières en France' (1888); 'Un centenaire économique, 1789-1889' (1889); 'Vocabulaire manuel d'économie politique' (1898); 'Finances contemporaines' (2 vols., 1903); 'L'Année de l'entente cordiale et de l'arbitrage' (1904); 'La banque de France de 1880 à 1905' (1905); 'L'Obsession fiscale' (5 vols., 1902-07); and 'Que doit-on faire de son argent' (1913).

NEZ PERCÉ (nā pēr-sā') **INDIANS**. See CHOPUNNISH.

NGAMI, ngā'mē, **Lake**, Africa, in western Rhodesia, north of the Kalahari Desert, a portion of a great prehistoric inland sea, when first visited by Livingstone and Oswell in 1849, about 20 miles long, 10 miles broad and very shallow. Its only feeder was the Teoge or Kubango and its outlet the Botletli or Zuga. In the rainy season the water was fresh, but in the dry season the lake became a mere brackish marsh. Since 1890 the waters have gradually disappeared, the site of the lake now being marked by an extensive reedy marsh-land, some portions of which are utilized for growing corn. It is believed that formerly it had an outlet to the Limpopo Basin.

NGAN-HUI, n-gän-hwē', or **NGAN-HWEI**, n-gän-hwā'ē, China, an eastern inland province, intersected by the Yang-tse-kiang, separated from the ocean eastward by the provinces of Che-kiang and Kiang-su, and bounded northwest by Ho-nan, west by Hu-peh and south by Kiang-si. The principal river is the Yang-tse-kiang, giving water communication to the interior. The province is fertile; there are great areas under forest; coal and iron ore are the principal minerals. Area, 54,826 square miles; pop. about 17,300,000; capital, Nanking-fu (q.v.).

NGAN-KING-FU, n-gän' king' foo', China, a city and river-port, capital of Nganhui (q. v.), on the north bank of the Yang-tse-kiang, about 200 miles above Nanking; since 1897 open to foreign trade. It suffered severely during the Tai-ping Rebellion. Pop. about 40,000.

NGORNU, n-gör'noo, or **ANGORNU**, Africa, a town of Bornu, British Northern Nigeria, on the southwest shore of Lake Chad, 15 miles south of Kuka, the capital. It is on the trade route communicating with the interior and the coasts, and its fairs are of great commercial importance. The town is subjected to inundations from the lake during the wet season. Pop. 40,000.

NIAGARA, nī-ăg'-ă-ra, *Battle of*. See LUNDY'S LANE, *BATTLE OF*; also CHIPPAWA, *BATTLE OF*.

NIAGARA FALLS, Canada, a town of Welland County, Ontario, on the west bank of the Niagara Gorge, just below the Falls, and opposite Niagara Falls, N. Y. It communicates with the United States by three bridges, has electric and steam railroad service and is a station on the Michigan Central and on several lines linking with the Grand Trunk. It commands the best view of the Falls from Queen Victoria Niagara Falls Park, extending above and below the Falls for two and a half miles. Enormous electric power plants, larger than on the United States side, have been constructed to utilize the water power. Cereal foods, carborundum, graphite, cyanide, wire and steel chains, hosiery and automobile accessories are among the industries. The town was originally named CLIFTON or SUSPENSION BRIDGE, after its English prototype at the Severn Gorge, Bristol (q.v.). Pop. (1921) 11,789.

NIAGARA FALLS, N. Y., city in Niagara County, on the Niagara River, and on the New York Central and Hudson River, the Wabash, the Erie, the Michigan Central, the Grand Trunk, the West Shore and the Lehigh railroads, about 25 miles north by west of Buffalo. Until 1892 what is now the city constituted two separate villages, Niagara Falls, originally known as Manchester and Suspension Bridge, formerly Niagara City; they were consolidated in that year and chartered as a city. (For the New York State Reservation and the bridges connecting the city with the town of Niagara Falls (q.v.), Ontario, see NIAGARA). The manufacturing establishments have increased and are increasing since the utilization of the power of the river by the new methods. The chief manufactures are paper, flour, dressed lumber, wheat biscuit, electro-chemical products, foundry products, machinery, chemicals, metalurgical products, aviation materials, electric batteries and wood products. It has a public library, the building for which was donated by Andrew Carnegie, a high school, business schools, public and parish schools, the De Veaux College (Protestant Episcopal) and the Niagara University (q.v.).

On account of the Falls, one of the scenic wonders of the world, the city is visited annually by thousands of tourists. The government, administered under the city manager form, provides for a mayor, who holds office for four years, and a council. The administrative officers are appointed by the mayor and city manager. A recent assessed value of the real estate was about \$36,785,780. Pop. 42,257.

NIAGARA. Description and Geography.

—The course of the Niagara River runs a little west of north from Lake Erie, through a flat and fertile country for about 20 miles, carrying with it the drainage of Lake Erie and the Upper Great Lakes. At the end of this 20 miles the river, which has descended for the last half mile in a series of rapids and cascades, comes to an abrupt declivity, the Niagara escarpment, and the water makes a sudden plunge, dividing into two falls, the American Fall, 167 feet in height, with a comparatively straight crest of 1,060 feet, and the Canadian or Horse-

shoe Fall, 158 feet in height, with a deep curve in the centre, a crest of about 2,500 feet and running at right angles to the river. The Canadian Fall carries much the larger volume of water, it having been estimated that only about 10 per cent of the water flows over the American Fall. The apex of the Horseshoe Fall is accepted as the boundary line between the United States and Canada, thus placing the islands at or near the Falls except Cedar Island and the Dufferin Islands in the United States. Behind the Luna Fall, a small section of the American Fall, is the Cave of the Winds, a natural rocky chamber eroded by the water, approximately 100 by 75 feet and a favorite resort for tourists desiring to experience the full force of the cataract.

From the Falls the river descends in a series of rapids between rocky cliffs of from 200 to 350 feet in height, for about three miles, until it reaches the Whirlpool, a "circular excavation in the westerly bank of the river, the boundaries of which are rocky cliffs 300 feet high for two-thirds of its circumference, while the other third, its northerly bank, is made of an accumulation of sand, gravel and clay." The river rushes into this elbow with tremendous force in a northwesterly direction, but has to turn and leave it in a northeasterly direction. The impact of these two currents meeting forms the rotary movement of the Niagara, called the Whirlpool, which with the Whirlpool Rapids below is second only to the Fall itself in beauty and fascination. From here the river flows through the deep gorge until it reaches the Lewiston escarpment, and on through a low plain to Lake Ontario, a total fall of 326 feet from the level of Lake Erie. The width of the gorge at the top varies from 700 feet at the Whirlpool to 1,700 feet opposite the centre of the American Fall. At the water line the width decreases. The depth of water on the crest of the American Fall measures from one and one half to four feet under usual conditions, but northerly and easterly winds have at times set the water back, until the Fall has been nearly dry. The depth of water of the Horseshoe Fall is not definitely known, although various attempts have been made to compute it.

Geology.—The life history of Niagara Falls has long been a fascinating and absorbing study for the geologists of the world. It is of supreme importance, as here, more completely than any other known place, are presented the evidences which give a measurement of the time which has elapsed since the disappearance of the northern ice sheet of the glacial period. The first geological survey of the Falls was made in 1842 by Prof. James Hall and from that time to the present day geologists have attacked the problem of the age of the Falls, with varying results, according to their standpoints and the theories of their respective ages. The age of the Falls has been variously estimated at from 5,000 to 50,000 years, a wide margin, which shows that the subject is still fruitful for study.

Modern students accept certain fundamental theories regarding the geological history of Niagara. It is believed that the valley of the present Niagara was determined in general outline in pre-glacial times when the American continent stood at an elevation of from 2,000 to

5,000 feet higher than at present. By study of the erosion of smaller streams in the vicinity under similar conditions, the pre-glacial Niagara Valley may be reconstructed as beginning at the northerly part of Buffalo, draining northward by way of the Whirlpool and Saint David's Channel, recognized by Hall and Lyell, early in the 19th century, while the lake basin to the south of the Buffalo watershed was at least 150 feet below the top of the limestone

Pre-glacial Drainage.

(Dotted lines, present drainage; black lines, preglacial drainage.)

terrace and drained to the west. With the advent of the Ice Age, the whole drainage of the North American continent underwent a change. The ice filled the basin of the Ontario Valley, and the streams flowing into it had to find an outlet to the south. This was probably the period when the Tonawanda and Chippawa creeks overflowed their southern boundaries at Buffalo into the valley of Lake Erie, which overflow finally eroded the present inlet. With the gradual recession of the ice sheet northward, and the constant increase of water masses, the outlet of the drainage flowed at different times in different sections of the divide to the south into the Mississippi or the Mohawk valleys. As the level of these glacial lakes lowered, the continent itself lowered, until finally the level of Lake Erie was about 30 feet higher than at present, and drained through the present valley of Niagara. As the level of Lake Ontario fell, the waters found the lowest point

in the escarpment at Lewiston, and the Niagara we know was born.

It is inaccurate to speak of the beginning of the Falls at Lewiston, as the thin layer of limestone on the top of the escarpment, with masses of soft shale underneath, did not offer sufficient resistance for the formation of a fall, but made the work of erosion so easy that it is probable that a series of rapids were formed, as Lake Ontario became lower. This gorge eroded its way southward until it met the ancient channel of the Tonawanda and the Chippawa at the whirlpool, and then began the erosion of the present gorge south of the whirlpool. Geologists differ greatly as to the age of the gorge south of the whirlpool, one school maintaining that it is pre-glacial and another that it is entirely post-glacial. The middle ground between the two is that the pre-glacial stream did not cut deeply, and that the erosion of the gorge from the whirlpool southward is largely post-glacial. It is accepted that originally the Falls were undivided, but as the work of erosion and recession proceeded, until the fall reached the northern end of the American Fall, Goat Island and the other small islands on the American side came into existence, and the Falls divided, the larger volume of water remaining in the deepest channel, west of Goat Island, and the lesser volume forming the American Fall. The Horseshoe Fall, owing to its larger volume of water and deeper channel, recedes much faster than the American. A geologic section of the Niagara region from Lake Erie to Lake Ontario exposes the following strata of the Silurian: The Medina series, sandstones and shales, distinguished in this section by their bright red color; the Clinton series, shales and limestone; the Niagara, shale and limestone; the Salina series, gypsum and shales in varying thickness; the Water Line group. Of the Devonian: the Corniferous and Helderberg limestone. From north to south may be successively met all the series from the Medina group to the Niagara limestone, up the gorge along the cut of the New York Central Railroad. At Lewiston may be seen at the water's edge about 230 feet of shales and sandstones of the Medina series of red color; above this 32 feet of Clinton limestone and shale of greenish and white color, overlaid by 70 feet of gray-colored Niagara shale and 20 feet of drab-colored Niagara limestone. There has been considerable speculation on the part of geologists as to the probable future of the Falls. Observation and investigation have shown that rapid changes are taking place in the crest and contour of the Horseshoe Fall. In 1890 the crest of the Canadian Fall measured 3,010 feet. It now measures approximately 2,500 feet. A certain portion of this change is due to erosion and recession. In 1904-05 the crest of the Fall was further narrowed by the artificial filling of the channel on the Canadian side. Consult Dow, C. M., 'A Bibliography and Anthology of Niagara Falls' (chapter 7), which contains a full bibliography of the geology of Niagara, with many extracts and quotations from the leading geologists of the different periods.

History.—When we speak of the Niagara frontier we mean the region bordering the river of Niagara from its beginning at Buffalo to its termination at Fort Niagara on Lake Ontario. The most striking feature in connection

NIAGARA

Wide World Photos

Airplane view of Niagara Falls taken from an American Army Airplane showing the Canadian or Horseshoe Falls, the American Cataract, etc.

with the history of this region is its antiquity. We are not accustomed to think of the Niagara in the same breath with the Atlantic Coast, but the fact remains that Niagara was known even before Jamestown and Plymouth Rock. Through all the early history of our continent this region played a large part in the affairs of nations, and to-day the Falls are known the world over as a marvelous scenic spectacle, and the source of a tremendous power in the industrial development of the two great English-speaking nations. Father Hennepin was long credited with the honor of being the first white man to see and describe the Falls, but later researches have revealed that several French missionaries and explorers, among them Champlain, preceded him to the Niagara region and wrote of the Falls, although the evidence goes to prove that they did not explore the river, and received their accounts of the Falls from the Indians. La Salle made his first expedition to the Niagara in 1669, and on his second visit in 1678 he was accompanied by Father Hennepin. Hennepin's earliest and most trustworthy account of the Falls was published in his 'Description de la Louisiane' in 1683, and his famous picture of the Falls appeared in the edition of 1697. Whatever his claims, it may be truthfully said that Hennepin was the first European to see, to describe and to depict the Falls. Through the French missionaries and explorers friendly relations were established with the Indians of the Niagara region. Various trading posts were built, and in 1725-26 Fort Niagara was erected at the mouth of the river and became the centre of a broad French influence. The French domination of the region lasted until 1759, when Fort Niagara and its dependencies were surrendered to the British. In 1763 occurred the massacre of a British force near Fort Schlosser by a band of Indians under Pontiac. Many of the victims were thrown or driven alive into the Devil's Hole Ravine on the banks of the Niagara. This was the last rebellion of the Indians against the British rule. A strong garrison was maintained at Fort Niagara, and the region was controlled by the British until 1796, 13 years after the close of the Revolutionary War. In this locality were planned the Indian raids against the settlers of western New York and Pennsylvania which were a feature of Revolutionary times, and which resulted in Cherry Valley, Wyoming and other massacres. In 1812 Niagara became the scene of land conflict between the British and the Americans. Various engagements were fought, with success first to one side and then the other, until the siege of Fort Erie by the British was ended by a brilliant sortie of the Americans in September 1813. With the Treaty of Ghent 1814, began the Hundred Years' peace on the Niagara.

The general development of the Niagara region was slow. In 1802 the American side was opened for settlement by the Holland Land Company, but the opening of the Erie Canal in 1825 gave the whole region its first great impetus toward permanent establishment and development. The city of Niagara Falls, formerly Manchester, while still maintaining its tourist aspect, especially in summer, is a thriving community with unusual opportunities for manufacturing and industrial development owing to the great reservoir of power at its doors. Fort

Niagara is maintained as a United States military post, and there are still standing on this site several structures left from the French and British periods of occupancy.

New York State Reservation at Niagara and Queen Victoria Niagara Falls Park.

In 1879 Governor Robinson in a message to the New York State legislature advocated the purchase by the State of land along the Niagara River and Falls to be used as a State park and reservation. After public interest in the matter had been aroused, a bill passed the legislature of the State of New York in 1883 authorizing the purchase of the present reservation, a tract of 412 acres, 300 of which are under water, and placing this reservation under the control of five unsalaried commissioners to be appointed by the governor. The control of this territory is still vested in New York State, and is administered by an appointive commission. The province of Ontario, under the leadership of Lord Dufferin, very promptly took similar steps for the preservation of the scenery on the Canadian side, and by successive purchases and grants the Canadian government acquired a strip of land along the river from Lake Erie to Lake Ontario comprising 1,178 acres and known as Queen Victoria Niagara Falls Park. The Canadian Park is administered by a board of seven commissioners, who are appointed by order of council and who serve without compensation. The policy of the two governments has been to preserve for the future all the surroundings, as well as the natural beauty of the Falls, and where by the vandalism of previous generations the scenery had been marred in any way, to restore it so far as possible to its original setting. Such buildings, bridges and other structures as the New York State Commission has deemed it necessary to build have been planned with a view to the harmony of the landscape. The commission has also been zealous in protecting the cataract from any unbridled use of power which would destroy its beauty. Consult Dow, C. M., 'A History of the State Reservation at Niagara' (Albany 1914), which contains the complete story of the establishment of the reservation, its administration, the policy of the commission and its achievements and an account of the power situation.

From the city of Niagara Falls, N. Y., down through the gorge along the brink of the Niagara River past the turbulent rapids and whirlpool, forming an unrivaled scenic route, an electric trolley line runs and connects by the Queenstown bridge with the Canadian heights above the edge of the gorge. The line extends beyond the Horseshoe Falls to Chip-pawa and stop-offs allow sightseers to visit the parks and all points of interest. The railway and other bridges spanning the gorge also afford airviews of the entire length of the gorge, of the falls and their attractive natural and other features.

Power.—The history of industrial Niagara is the story of one of the most vital economic developments of the age. The first application of Niagara power was that in the saw mill built by the French in 1725 on the New York bank of the river near the rapids. Augustus Porter built a mill on the New York bank of the upper river in 1805, and two years later Porter and Bacon erected a grist mill near the

same location. Other mills and one dynamo for arc lighting purposes were established before 1885, when the State took over the property where these mills stood. The total capacity of the mills operated before that date by the American Falls was about 100 horse power. The first diversion of water from above the cataract for power purposes was proposed in 1842 by Augustus Porter, but it was not until July 1861 that the canal for carrying the water from above the Falls to a point near the top of the gorge was completed. The Civil War checked the development of this power for a time, but in 1877 the canal and the river frontage at both ends of it were purchased by the Niagara Falls Hydraulic Power and Manufacturing Company, and the power thus diverted was utilized. The water rights of this company are limited to the capacity of the canal. The possibilities unfolded by the generation of water power into electric energy and the transmission of this electric energy to distances unthought of, comparatively few years ago, have exerted a strong influence upon the power development at Niagara. In 1885 Thomas Evershed proposed a plan which contemplated the diversion of water at a point more than a mile above the Falls. This water was to be conducted beneath the city of Niagara Falls with a system of canals and wheel-pits for the purposes of power production. The Niagara Falls Power Company was organized to carry out this plan in a revised form and electric distribution of power was to take the place of branch canals and tunnels. The construction of this work was begun in 1890, and the first electric energy was sold to the Pittsburgh Reduction Company for the manufacture of aluminum in 1895. The Niagara Falls Hydraulic Power and Manufacturing Company constructed a generation equipment at the foot of the cliff in 1895, and these two are the only power companies actually in operation on the American side, although two other companies not operative claim rights under old charters granted by the State of New York. On the Canadian side four power companies following in construction the plan of the American plants are in operation. The policies of the governments of Canada and the United States toward the utilization of the Niagara power afford an interesting contrast. The power companies on the American side divert the water under legislative grant for commercial purposes entirely free from any rental or revenue charge by the government for the use of this power. The Canadian government, on the other hand, far-seeing in its policy, has, as a condition for each permission to divert the waters of Niagara for power purposes, required an adequate yearly rental from the power companies, this rental being based on the amount of horse power generated. Before 1913 the amount of water diverted from Niagara may be summed up as follows, the figures being the number of cubic feet diverted each second.

Niagara Falls Hydraulic Power and Manufacturing Co.	6,500
Niagara Falls Power Co.	8,600
Canadian Niagara Power Co.	9,500
Ontario Power Co.	12,000
Electrical Development Co.	11,200
Electric Railway Co.	1,500
	34,200
Total	49,300

With the lapsing of the Burton Act of 1913 the amount diverted has materially increased, the Burton Act having been designed to protect the natural scenery of the Falls by keeping within bounds the use of power on the American side and by restraining the sale and transmission of power from the Canadian side to manufacturing establishments operating in the United States. The tremendous demand for electrical power brought into being by war industries during 1914-18 again increased the diversion of water for power purposes. Niagara power is used in Syracuse 165 miles from its source for manufacturing purposes and for the operation of electric railways and also in Windsor, Ontario, 240 miles away. This achievement of science and technical skill which has harnessed one of the great forces of nature for the use and benefit of man is indeed one of the marvels of our age.

CHARLES M. DOW.

NIAGARA FORT. See FORT NIAGARA.

NIAGARA INTERNATIONAL PARK, on both sides of Niagara River at Niagara Falls, a reservation for public purposes established by the joint action of the legislature of the State of New York and the Parliament of the Dominion of Canada. See NIAGARA.

NIAGARA-ON-THE-LAKE, Canada, a town of Lincoln County, Ontario, at the mouth of Niagara River, on the west bank, 12 miles below Niagara Falls, and 36 miles by water from Toronto. It is a pleasant summer resort. It was burned down in midwinter 1813, by the Irish-American General McClure during his retreat, an unnecessarily savage action that was deplored by both sides and led to cruel reprisals. Pop. 1,318.

NIAGARA SERIES, in geology, the earliest strata of the Upper Silurian era, following the Oswegan Series and preceding the Onondaga Series and the lower Helderberg Series. It, in turn, is subdivided into the strata of the Clinton group and those of the Niagara formation. Neither is continental in extent, but both are important, are very rich in fossils and

NIAGARA

NIAGARA

Niagara Falls in winter

consist of sandstones, limestones and shales. The Clinton formation, shaly sandstone in New York and Pennsylvania, and more completely limestone further west, occurs in Ohio, Indiana, Wisconsin, Tennessee, Kentucky, Alabama, Missouri and Georgia; and is marked by the occurrence of oolitic argillaceous hematite. The Niagara formation is a thick limestone, underlaid with shale; the wearing away of the latter undermines the limestone as at Niagara Falls. The Niagara group occurs in New Hampshire, Connecticut, Ohio, Illinois, southern Michigan, New York, Ontario, Indiana, Iowa, Missouri, Maine and the Maritime Provinces, western Tennessee, northern Kentucky, Missouri, Arkansas and (scantly) in the Rockies. The fossils of the series are mollusks, corals, crinoids, etc.; apparently there are no land or fresh-water animals.

NIAGARA UNIVERSITY, Niagara County, N. Y., a Catholic educational institution founded by the Rev. John J. Lynch of the Congregation of the Mission in 1856. The imposing buildings occupy a prominent position on the American bank of the Niagara River 250 feet above water level, between the Falls and Lake Ontario, commanding a full view of the rapids, the gorge and the country for a radius of several miles. The grounds cover an area of 300 acres. The high school, college and seminary departments with their various courses lead to the degrees of B.A., B.S., Ph.B. and M.A. The institution not only enjoys the powers and privileges of a university granted by State legislature but is numbered by the State Board of Regents among the approved colleges of high standard, and her degrees placed in the same class as those of leading educational institutions of the country. Her alumni have become prominent in Church and State, in public and professional life. The faculty numbers 22; the annual enrolment of students who come from all parts of the country averages 400. The university library contains over 20,000 volumes. The grounds and buildings are valued at \$500,000.

NIAM-NIAM, nē-ām' nē-ām'. See NYAM-NYAM.

NIANTIC (Naiantukquia, "the point at the river's mouth"), an Algonquian tribe at one time prominent in American history. When first historically known it occupied the coast of Rhode Island from the region of Narragansett Bay to Connecticut. The Niantic spoke the same dialect as the Narragansett and the two tribes are often confounded with one another. They seem to have looked upon themselves as practically one people; and their interests were closely united, yet they always remained, in organization at least, distinct tribes. This is seen in the fact that when the Narragansett threw all their energies and resources into King Philip's War, the Niantic refused to have any part or share in it. After the destruction of the Indian power the Narragansett, as they surrendered to the government in small bodies from time to time, were sent to live with the Niantic, who had by their foresight preserved their independence, their land and their tribal organization. Curiously enough, however, they lost their tribal designation to the newcomers, owing to the fact that the Narragansett, though utterly defeated, scattered and

broken, had so impressed the terror of their name upon the imagination of the people of the Rhode Island coast and neighboring country that the more peaceful and less historic Niantic were lost sight of in the face of a tribal combination in which the warlike Narragansett formed a prominent part. Henceforth the fused tribes were known as Narragansett, though they were, as a matter of fact, more strongly Niantic than Narragansett. See NARRAGANSETT.

NIAS, nē-ās', Dutch East Indies, an island in the Indian Ocean, off the southwest coast of Sumatra, from which it is separated by a strait 60 miles wide. It is about 70 miles long, 20 miles average breadth, area, 2,100 square miles. The surface is mountainous, attaining a maximum altitude of 1,970 feet. In 1857 when the Netherlands took possession of the island, the population was reckoned at 17,000. The Niasers are of the Malay race, but fairer than the usual type. They are industrious and frugal, expert handicraftsmen, temperate and regular in their habits, but inclined to be avaricious, vindictive and sanguinary. The chief vegetable products are rice, coconuts, bananas, tobacco, sugarcane, etc., and annually about 110,000 pounds of pepper. Hogs are reared, and there is a domestic export trade with Sumatra in rice, yams, beans and poultry. Pop. about 200,000. Consult Modigliano, 'Un viaggio a Nias' (Milan 1890); Sundermann, H., 'Kleine niassische Chrestomathie' (in 'Bijdragen voor de taal-landen volkenkunde van Nederlandsch Indie,' Vol. VII, 5th series, The Hague 1892); id., 'Kurzgefasste niassische Grammatik' (Mörs 1892); id., 'Deutsch-niassisches Wörterbuch' (Mörs 1892).

NIATA, or **NATA**, a breed of Argentine cattle, which long ago started among the Pampas Indians, and is now nearly or quite extinct. They were really deformed, the parts of the face being so out of proportion as to give the face a queer pug-like appearance. They were very interesting to the students of evolution as an example of a variant which maintained its peculiarities through a long period, breeding "true," and showing no reversion to the normal type. Consult Darwin, Charles, 'A Naturalist's Voyage Around the World' (new ed., New York 1908).

NIBELUNG, nē'bē-loong, in Scandinavian mythology, a monarch whose subjects are called Nibelungs and territory the Nibelungenland. There were two contemporary kings in this realm, against whom Siegfried, Prince of the Netherlands, fought. He slew the 12 giants who formed their paladins with 700 of their chiefs. Siegfried's warriors then became known as the Nibelungen, but after the assassination of Siegfried, when the treasure he had amassed passed into the hands of the Burgundians, these latter appropriated the name and were known by it in the heroic poems and tales of the Middle Ages. The word Nibelungen is from *nebel* (darkness), and means the children of mist or darkness.

NIBELUNGEN RING, The. A group of four operas by Richard Wagner, who also wrote the librettos, calling the entire work a "Stage Festival Play for Three Days and One Preliminary Evening," first produced in its en-

tirety at Bayreuth, 13, 14, 16 and 17 Aug. 1876. The names of the separate music dramas, as Wagner preferred to have them called, are 'Rhinegold' ('Das Rheingold'), 'The Valkyrie' ('Die Walküre'), 'Siegfried' and 'Dusk of the Gods' ('Die Götterdämmerung'). They are commonly spoken of collectively as a trilogy and sometimes as a tetralogy. 'Rhinegold' was first performed separately (against Wagner's wish) at Munich, on 22 Sept. 1869, and 'Walküre' on 26 June 1870, the others receiving their first performance at the Bayreuth production. Although too lengthy to be given in less than four evenings and, in fact, more often heard piecemeal than as a single opus, the "Ring" was conceived by Wagner as a unit and for an intelligent understanding of its artistic purpose must be studied as such. Originally, Wagner planned a drama on "Siegfried's Death," that part of the story now told in 'Götterdämmerung,' taking his material from the Norse Eddas and the Germanic "Niebelungen-Lied," and modifying it to suit his own ideas; and then, as he found that the origins of many of the incidents required elaboration, he worked backward through the tale of the young Siegfried and that of Siegmund and Sieglinde, his parents, and Brunnhilde, to the initial crime of Alberich's rape of the gold from the Rhine-maidens and the consequent train of events that involved Wotan and the rest of the gods of Walhalla. The poem in its entirety was completed early in 1853 and the music was at once commenced, this time in chronological sequence. It was more than 20 years, however, before the last notes were written. Wagner, despairing of an opportunity for its production, stopped half-way through 'Siegfried' to write 'Tristan und Isolde,' 'Die Meistersinger' was also composed in the interim. The story of the rescue of Wagner's hopes by the king of Bavaria and the establishment of the Festival Theatre at Bayreuth has been often told. Consult Finck, Henry T., 'Wagner and His Works.'

In turning for his dramatic material to the poetic myths which were familiar household tales to the German people, Wagner was consciously trying to follow where the Greeks had led; and his great canvas, depicting the figures of the legendary gods and heroes in a dramatic sequence was quite in the Greek manner. On the primitive conceptions, of the old Skalds Wagner imposed a whole modern philosophy which does not at all points rest easily on the foundation stones; but the power of his genius has reared a structure of such imposing grandeur that the imperfections seem to shrink to small proportions. To what extent the "Ring" dramas would stand without their musical environment might be an interesting, but hardly a fair, inquiry, since Wagner's avowed purpose was to create an art work that should be judged, not as music or drama, but as a combination of the arts.

With the composition of the "Ring," Wagner developed most extensively his system of leading motive or leading motives (guiding themes is perhaps a better equivalent), short, delineative, musical phrases, woven through the music and designed as a sort of running commentary on the stage-play. While the musical enjoyment of those works, of the closely-knit, elaborate symphonic development of musical ma-

terial that unifies them from first page to last, is in no sense dependent upon a study of the handbooks describing and tagging the themes, familiarity with the composer's intention greatly increases the listener's artistic pleasure. Wagner was not only a great composer. His was a remarkable intellect; and a careful study of his leading motive system, showing the meticulous care with which text, situation and music are joined, the many alterations to which the motives are subjected to express new shades of meaning, the constant development and expansion of the themes to serve the dramatic requirements, the ramifications of this most intricate machinery of dramatic expression cannot fail to become a rare intellectual treat. One of the most telling instances of the employment of leading motive occurs in the last act of 'Götterdämmerung,' where Siegfried narrates his life story, which is eloquently mirrored in the orchestral accompaniment. In the death-march and Brunnhilde's final apostrophe, the familiar themes are brought together in a web of contrapuntal texture and color, a veritable musical apotheosis that has no equal in the whole range of music. Saint-Saëns has written that "from the elevation of the last act of 'Götterdämmerung' the whole work appears in its almost supernatural grandeur, like the chain of the Alps seen from the summit of Mont Blanc." (Lavignac's 'Music Dramas of Richard Wagner,' translated by Esther Singleton, contain an excellent comprehensive analysis of the leading motive system in all of the Wagnerian operas).

The first of the "Ring" operas produced in America was the 'Walküre,' at the Academy of Music, New York City, on 2 April 1877, under the direction of Adolf Neuendorff, who was early identified with the Wagnerian gospel. 'Siegfried' was not heard here until 9 Nov. 1887, when it was given at the Metropolitan Opera House in New York, and 'Götterdämmerung' and 'Rheingold' followed in the same season. These three performances were under the baton of Anton Seidl who did more than any one else to acquaint America with the finest traditions of Wagnerian performance. The first American presentation of the "Ring" in its entirety and without cuts took place at the Metropolitan Opera House January 1899.

LEWIS M. ISAACS.

NIBELUNGENLIED, The, the most famous of the mediæval epics, was written in all probability in the decade between 1190 and 1200. It is based on earlier individual ballads, but in its present form is the work of some minstrel who gave it its courtly form. It belongs to the type of the folk epic, as the author is unknown, and it is written in four-lined strophes instead of the rhyming couplets of the courtly epics. A veneer of chivalry has been flung over it, but the elemental natures of the old Teutonic heroes are continually breaking through with uncontrollable force. Its great popularity is attested by the large number of manuscripts that have come down to us. We possess in all 28 more or less complete ones, preserved in 31 fragments. Only nine of these, however, can be considered fairly complete, and only three, designated as A, B, C, are considered of primary importance. A battle royal has been fought to prove that each one of these in turn stands nearest to the original. It is now generally considered that C, the longest, is

a later redaction, but opinions are still divided as to whether the priority should be given to A or B, the probabilities, however, being that B is the more original, and A merely a careless copy.

The *Nibelungenlied* is the best portrayal of the ancient Germanic ideal of *Treue* (faithfulness), faithfulness to death and even beyond the grave. Its theme is also "How pleasure ends at last in pain." It tells the story of the love of the youthful knight Siegfried for the Princess Kriemhild, the sister of King Gunther of Worms. After a year's wooing, during which time Siegfried defeats the Saxons, the couple are happily married, Siegfried also helping Gunther to win the hand of the warlike maiden Brunhild. The mutual jealousy and distrust of the rival queens finally culminates in a dramatic quarrel in front of the portal of the church, in which Kriemhild is triumphant. Brunhild in her blind fury now plans the death of Siegfried and has him foully murdered by the gloomy Hagen, as he is quenching his thirst in a woodland spring. For a long time Kriemhild nurses her revenge. Finally she marries Etzel (Attila), the king of the Huns, has her brothers invited to a great festival and killed in a series of exciting combats, with which the second part of the poem is largely taken up. Nemesis, however, overtakes her in the person of old Hildebrand, the armor bearer of Dietrich of Berne. Furious that such brave heroes should fall at the hands of a woman, he cuts her in two with his sword, leaving Dietrich and Etzel to mourn over the bodies of the slain.

In a certain sense the poem is only a torso, as it relates almost nothing of Siegfried's early life, his encounter with the dragon, the curse pronounced upon the possessor of the *Nibelungen* treasure, Siegfried's awakening of Brunhild from her magic slumber within the charmed wall of flames. Nor is the poem entirely homogeneous; furthermore, it contains not a few contradictions. In spite of these defects, however, it is undoubtedly the finest product of Middle High German epic poetry. It is imposing through its very simplicity, through the grandeur of the story which it in no way seeks to adorn or decorate. The account given of Siegfried's youth is related in Scandinavian sources such as the 'Edda,' the 'Volsungasaga' and the 'Thidreksaga' and forms the theme of Wagner's musical dramas the 'Nibelungen Ring.' Still, the legend is supposed to be of German origin and to have been taken to Scandinavia early in the 6th century by German traders, or, as Mogk thinks, by the Heruli on their return to Norway after the defeat of the Longobardi.

Notwithstanding the popularity of the *Nibelungenlied* during the Middle Ages it was soon forgotten by the mass of the people with the decay of chivalry. The figures of the old legend, however, lived on and were embodied in a popular ballad, 'das Lied vom hürnen Seyfried,' preserved for us in a print of the 16th century. It was dramatized by Hans Sachs, the shoemaker poet of Nuremberg, and related in prose form in a chapbook of the 18th century. The poem itself was rediscovered by a German physician, J. H. Obereit, who found the manuscript C at the castle of Hohenems in the Tyrol 29 June 1755. The scientific study of the poem began with Karl Lachmann, who in 1816 read

an epoch-making paper on it before the University of Berlin. He published also a critical text of A, now in its fifth edition (Berlin 1878). K. Bartsch and later Paul Piper published editions of B, Fr. Zarncke of C (6th ed., 1887). Useful works on the legend are Lichtenberger, N., 'Le Poème et la Légende des Nibelungen' (Paris 1891); Holz, G., 'Der Sagenkreis der Nibelungen' (Leipzig 1907); Kettner, E., 'Die österreichische Nibelungendichtung' (Berlin 1897); Fr. von der Leyen, 'Die deutsche Heldensage' (Munich 1912); Weston, Jessie L., 'Legends of the Wagner Drama' (London 1896); Genung, C. H., 'The Nibelungenlied' (in Warner's 'Library of the World's Best Literature,' Vol. XVIII, New York 1897). The best German translation is probably that of Karl Simrock published by G. Holz, 1909. Good English translations in verse have been made by G. W. N. Lettson, 'The Fall of the Nibelungers' (London 1874); Needler, G. H. (1904), and Way, Arthur S., 'The Lay of the Nibelung Men' (New York 1912). Alice Horton has retold the story in modern prose, 'The Lay of the Nibelungs' (London 1898), and D. B. Shumway has made an exact prose rendering 'The Nibelungenlied' (Boston 1910). Full bibliography is given by Th. Abelung, 'Das Nibelungenlied und seine Literatur' (Leipzig 1907); and by F. E. Sandbach, 'The Nibelungenlied and the Gudrun in America' (New York 1905).

D. B. SHUMWAY.

NIBLACK, Albert Parker, American naval officer: b. Vincennes, Ind., 25 July 1859. He was graduated from the United States Naval Academy in 1880; served with an expedition of survey and exploration to Alaska in 1884-87; was inspector of naval militia in 1895-96; and writer and lecturer on signaling and naval tactics at the Naval War College in 1893-96. He was then naval attaché at Berlin, Vienna and Rome till the Spanish-American War; during this war he served on the blockade of Cuban ports, being engaged in the battle of Nipe Bay. In 1898 he was transferred to the Philippines, took part in the suppression of the native insurrection, in the Boxer Campaign in 1900 in China, and in 1901 was appointed secretary of the naval commission in the Philippines to locate a naval station. Inspector of target practice 1902. Sea service Pacific station 1903-07. Promoted to commander 1 July 1907, and commander ships, Naval Academy and in Central American waters three years, going in July 1910 as naval attaché to Argentine, Brazil and Chile, and then to Berlin and The Hague. He commanded the third seaman regiment at the American occupation of Vera Cruz, 21 April 1914. Commanded the United States ship *Michigan* of the Atlantic fleet, and attended the Naval War College, 1916. He has written 'The Coast Indians of Alaska and Northern British Columbia' (1889).

NICÆA, nî-se'a, or **NICE**, Asia Minor, an ancient city, capital of Bithynia, on the east shore of Lake Ascania, 45 miles southeast of Byzantium, its site now occupied by the village of Isnik. As Ancore or Hellicore, it is said to have been colonized by Boeotians, and destroyed by the Mysians. Antigonus rebuilt it 316 B.C., and named it Antigoneia; but Lysimachus, having conquered this part of Asia,

changed its name to Nicæa, in honor of his wife, Nicæa, daughter of Antipater. Under the Roman Empire it retained long an exalted rank among the Eastern cities, and is renowned in ecclesiastical history for the famous councils held here in the reign of Constantine (325 A.D.); and by desire of the Empress Irene 785 A.D. In the year of the first council Nicæa was overthrown by an earthquake; it was restored by Valens in 368. After the foundation of the Latin Empire in Constantinople in 1204 the Greek Emperor Theodorus Lascaris made Nicæa the capital of his empire, which it continued to be until in 1261 the Greek emperors recovered Constantinople. It was finally taken by the Turks in 1330.

NICÆA, or NICE, The Councils of.

(1) An ecclesiastical council held at Nicæa, in Nicomedia, in 325. Of the method of summoning the first ecumenical council Gibbon says, "The archbishop or metropolitan was empowered by the laws to summon suffragan bishops of his province, to revise their conduct, to vindicate their rights, to declare their faith, and to examine the merit of the candidates who were elected by the clergy and people to supply the vacancies of the episcopal college. The primates of Rome, Alexandria, Antioch, Carthage and afterward Constantinople, who exercised a more ample jurisdiction, convened the numerous assembly of their dependent bishops. But the convocation of great and extraordinary synods was the prerogative of the emperor alone." Constantine before his conversion convened a council at Arles (314 A.D.). The object of the Council of Nice, likewise convened by him, was to settle the controversy which had risen in regard to the divinity of Christ, and to contradict and condemn the views of Arius. The bishops who attended the council are variously estimated: Gibbon gives 318; Eusebius, 250; other early authorities, 300 and 320. The Eastern bishops attended in person; the Western Church was represented by seven delegates, the most important of whom was Hosius of Cordova, who attended and presided as the Pope's delegate. The number of ecclesiastics of all kinds present was over 2,000. The session lasted about two months. It was frequently attended by the emperor in person. According to some accounts the earlier sittings were very stormy, and Constantine had to use much address to reconcile the disputants. Finally the council declared it to be and to have ever been the teaching of the church Catholic, in conformity with the apostolic tradition in all the churches, that Jesus Christ, the Son of God, is "consubstantial" — of the same substance or nature — with the Father; and accordingly in the creed called of Nice (otherwise the Nicæo-Constantinopolitan creed) are the words, predicated of the son of God *consubstantialis patri*, the word consubstantial being a rendering of the Greek word of precisely the same meaning and of analogous formation, *Homooúsios*. (See COUNCIL). (2) The second Nicene Council, the seventh ecumenical council of the Church, was summoned by the Empress Irene and her son Constantine, and met in 787 A.D. under Tarasius. The chief question was the reconsideration of the subject of images, the use of which successive emperors had forbidden; but the traditional view of the

Church was maintained at the council, canons were published on non-residence of the clergy, etc., double monasteries were forbidden and regulations adopted for the ordering of the lives of clerics and nuns.

NICANDER, nī-kān'dér, Greek physician and poet of the 2d century B.C. He was born in Claros, near Colophon in Ionia; was hereditary priest of Apollo in his native city, and may have spent part of his life in Italy. He wrote various didactic poems now lost; one of these was Virgil's model for the 'Georgics,' and another, the 'Heterœumena' or 'Transformations,' suggested Ovid's 'Metamorphoses.' 'Theriaca,' on dangerous wild animals, and 'Alexipharmaca,' on antidotes, his two extant works, were edited by Schneider (1816 and 1792). Consult Vollgraff, 'Nikander und Ovid' (1909).

NICANDER, Karl August, Swedish poet: b. Strengnäs, Sweden, 20 March 1799; d. Stockholm, 7 Feb. 1839. He was educated at the University of Upsala, and with a poem on Tasso took a prize at the Swedish Academy in 1826. In 1827-29 he traveled in Italy, and, returning to Sweden, lived in want all the rest of his life. He wrote poems, tales and dramas. 'Lejonet i öknen' (1838), a eulogy of Napoleon, is considered his best poem. His other works include 'Runesvärde' (1821), a drama; 'Hesperider,' poems and tales (1838), and 'Minnen från Södern,' recollections of Italy (1831-39). A collection of his poems was published in Stockholm (4 vols., 1839-41; 5th ed., 1883).

NICARAGUA, nē'ka-rā'gwā, a country of Central America, bounded on the north by Honduras, on the east by the Caribbean Sea, on the south by Costa Rica and on the southwest and west by the Pacific Ocean. It has 200 miles of seacoast on the Pacific and about 300 miles on the Caribbean. Its area, according to conservative estimates, including Mosquitia, is 49,200 square miles, total population 703,540.

Political Divisions. *Departments.*—Bluefields (formerly Zelaya), cap. Bluefields; Managua, cap. Managua; Granada, cap. Granada; León, cap. León; Carazo, cap. Jinotepe; Rivas, cap. Rivas; Chinandega, cap. Chinandega; Esteli, cap. Esteli; Jinotega, cap. Jinotega; Nueva Segovia, cap. Ocotal; Matagalpa, cap. Matagalpa; Río Grande, cap. Río Grande; Chontales, cap. Juigalpa.

Districts.—Cabo Gracias, Prinzapolca, Río Grande, Siquia, San Juan del Norte.

Physical Features.—The Sierra de los Morabios, running from the Gulf of Fonseca to the western shore of Lake Managua, appears to be the centre of volcanic energy in Nicaragua. It has the following vents: Cosigüina (famous on account of the terrific explosion of 2 Jan. 1835), Chonco, El Viejo (quiet since 1684), Santa Clara, Telica, San Jacinto, Rota, Las Pilas (eruption in 1850), Asososco and Momotombo (eruptions in 1870 and 1886); and though only two of these may be described as active, the others are dormant, rather than extinct. This ridge is near the Pacific Coast, and its southeasterly trend is continued by the isolated volcanoes Masaya (active), Apoyo (extinct), Mombacho, Ometepe and Madera (extinct). The two last are on an island near the western shore of Lake Nicaragua, and but a few miles

from the nearest point in Costa Rica. In other words, practically the entire Pacific Coast range is intensely volcanic; the only exception being found at Brito and the neighborhood southwest and south of Ometepe and Madera, where, according to the views of some geologists, the "internal fissure in the earth's crust that gave rise to the several volcanic vents of Central America" is "completely built up and healed. Hence the low gap in the grand American cordillera found at that place, which has a mean height of about 150 feet above sea-level, the lowest gap from Alaska to Tierra del Fuego." Through this gap, over this "healed fissure," the Nicaragua Canal (q.v.) was to have been cut. The volcanic characteristics are not found far inland, but are restricted almost entirely to the western border; nevertheless the principal cities are built in this narrow strip of land between the Pacific and the lakes. Chinandega, near the coast in the northwest, has about 11,000 inhabitants; León, 63,000; Managua, capital of the republic, 35,000; Masaya, 13,000, and Granada, on the west shore of Lake Nicaragua, 17,000. Of these the largest and most beautiful city, León, contains the cathedral of Saint Peter which, it is said, was built at a cost of \$5,000,000 when labor was valued at 25 cents a day. From the roof of this great church can be seen in one view 13 volcanoes. In the central region the largest town is Matagalpa (15,000 to 16,000). The western strip, despite its insecurity and oppressive climate, has been preferred as a place of residence by the majority of the Nicaraguans on account of its facilities for communication and transportation—among which are to be reckoned the great lakes, Nicaragua (92 miles long by 34 miles wide) and Managua (32 miles long by 16 miles wide), connected by a river which could, without difficulty, be rendered navigable. The greater part of the republic, stretching eastward from the lakes to the department of Zelaya, is of a different geologic formation. It is covered with a chain of mountains of moderate height, and transverse spurs which are not volcanic extrusions but Antillean folds. (See article CENTRAL AMERICA). The strip of Caribbean Coast "annexed" in 1894 by President Zelaya was formerly the Mosquito Reserve, or Mosquitia, a British protectorate; but Great Britain gradually withdrew in Nicaragua's favor her claim to exercise jurisdiction there. This eastern coast is now regarded as one of the most valuable parts of the republic and the "Atlantic Slope"—the Caribbean side in general—contains placer mines, its fruit industry is profitable, large plantations of rubber trees are being cultivated and rosewood, cedar and mahogany are taken from its forests.

Many parts of the central uplands are comparatively cool and well watered, with very rich soil and nearly untouched treasures in forest and mine; but they have remained undeveloped hitherto chiefly on account of the lack of good roads. The earthquake shocks of Nicaragua are less severe than those of Guatemala and Salvador, and dangerous fevers prevail chiefly, though not exclusively, in the lowlands or near stagnant water. The large rivers, rising in the central mountains and emptying into the Caribbean Sea, are the Segovia, also called Coco or Wanks, which forms the boundary with Honduras, the Grande, the Kurringwas and the

Bluefields or Mico. The San Juan flows from Lake Nicaragua to the Caribbean, and in part forms the boundary with Costa Rica on the south. The route of the Caribbean section of the canal, for which the waters of the San Juan would have been utilized, included a cut through Costa Rican territory west of Ochoa.

Fauna and Flora.—The fauna includes the puma, deer, jaguar, monkeys, alligators, armadillos, ant-eaters, guatuso, peccaries or wild hogs and many species of reptiles, some very poisonous. There are large herds of cattle. Prominent among avifauna are macaws, parrots, buzzards, wild turkeys and humming-birds. Insect life is super-abundant. Great trees extend over the eastern plain and the ground beneath them is covered with a dense network of vines and bushes. There are over 70 varieties of fruit trees, of which about 55 receive a measure of cultivation. About 50 varieties furnish various gums, resins, balsams, oils, spices, fibres, used in the industries and in medicine, and about an equal number of varieties furnish hardwood lumber. Citrus fruits abound in the western portion, and rubber also is plentiful. The forest resources have been utilized but little. Most tropical crops such as bananas, coconuts, plantains, oranges and pineapples, coffee, sugar, corn and beans, are grown and the area of cultivation is on the increase and would extend more rapidly but for the scarcity of labor.

Mineral Resources.—Among Central American republics, Nicaragua ranks second (Honduras being first) in respect to mineral wealth. Gold and silver are found in the departments of New Segovia, Chontales, Zelaya, León, Matagalpa and Jinotega; copper in León, New Segovia and Matagalpa; lead and iron in New Segovia and Matagalpa; mercury, salt, sulphate of lime, sulphur and combustible minerals in León; tin in New Segovia; nickel and zinc in Matagalpa. More than 500 mines are registered in the National Bureau of Statistics, and 494 of these are set down as producers of gold. Antimony, arsenic and other metals have been found but in unimportant quantities. In the 16th and 17th centuries great quantities of silver were produced and rich deposits of this metal are known to exist.

Industry and Commerce.—The forests contain mahogany, ebony, cedar, quebracho, light rosewood, mora, brazilwood, vanilla, sarsaparilla, vegetable wax, ipecacuanha, quinquina, copaiba, balsam, rhubarb, etc. In many parts of the republic—near both coasts, in the valleys, on the slopes and plateaus near the lakes and rivers—soils of exceptional value for agricultural purposes are found; and though the system of cultivation is rudimentary, extraordinary results are sometimes achieved. Thus, it is said on good authority that sugarcane produces at least two annual crops, and sometimes three; cotton planted in October is picked the following February on all the western lands; the virgin soil of the eastern slope yields four crops of maize in a year; and indigo can be cut three times before replanting becomes necessary. Coffee thrives best at elevations between 2,000 and 3,000 feet above sea-level. In the highlands of the northwest coffee is extensively grown. In a recent year 11,192,908 kilos, valued at \$5,004,449, were

exported. Rice produces abundantly on central and eastern slopes. The systematic cultivation of rubber has been undertaken recently. Bananas are grown in the west, principally in the departments of León and Managua, for home consumption; in the east, on a large scale, for export. The annual yield of cacao is insufficient to supply the local demand; in quality, however, it is so excellent that it brings a higher price in the home market than the imported chocolates. The selling price is from 20 to 25 cents gold per pound. Tobacco and aguardiente (made from sugarcane) are government monopolies. Tobacco is grown in several districts, the best being produced on the island of Omötepe, in Lake Nicaragua. Cotton, corn, breadfruit, black beans and sweet potatoes are produced in large quantities in the western part of the republic, and occasionally small quantities of beans, corn, cheese, lard and sugar are exported to the neighboring republics. In the upland regions the vegetables of the temperate zone are produced. Cattle raising is becoming an important industry in the northwest, and quantities of hides are exported. There are 1,200,000 cattle in Nicaragua. Horses and swine are reared.

Cigars are produced in large quantities. There are few manufacturing enterprises and these are engaged in turning out articles of a cheap grade for domestic consumption. Thus coarse cotton fabrics, boots and shoes, candles and soap are manufactured and also a cheap grade of furniture. Roofing tiles and pottery are also produced and the Indian population turns out hammocks, straw hats, gold and silver jewelry and carvings. For the better grades of manufactures the main reliance is upon the country's imports.

Exports consist principally of coffee, rubber, bananas, gold, hides, sugar, fine woods, cacao, coconuts, cotton dyes and dye-woods and silver. The imports are cotton goods, iron and steel manufactures, flour, chemicals, drugs and medicines, etc. In a normal year, imports amounted to \$5,770,006 and exports \$7,712,047. The principal exports consisted of 11,192,908 kilos of coffee, valued at \$5,004,449; gold to the value of \$1,063,007; bananas, 1,393,026 bunches, value \$429,802; hides and skins, 684,082 kilos, value \$326,559; 7,734 tons of wood, value \$321,869; rubber, 221,432 kilos, value \$278,763; cacao, 65,086 kilos, value \$39,828; dyewoods and dyes, 3,984,053 kilos, value \$39,455; sugar, 497,217 kilos, value \$31,805; 864,857 coconuts, value \$18,741; silver, 508 kilos, value \$17,137. In the same year the principal imports were: Cotton goods, \$1,417,032; food products, \$890,017; iron and steel manufactures, \$786,901; liquors, beer, wines, etc., \$238,881; hides and skins, \$223,205; chemicals, drugs and medicines, \$231,959; silk goods, \$149,905; vegetable fibres and manufactures, \$135,008; petroleum, \$106,377; woolen goods, \$95,797; paper and manufactures, \$81,776. In a recent year with the total value of Nicaragua's imports as \$3,159,218 and of exports \$4,567,202, her imports from the United States were \$3,159,218 and of exports to the same country \$3,079,810.

Shipping, Railways, Etc.—Corinto, the principal western port, has the advantage of the Pacific Coast lines of steamships, American, Chilean, British, etc. Bluefields, on the eastern

coast, has regular communication with the United States by means of the vessels of New Orleans and Mobile steamship companies. The Pacific Railroad of Nicaragua is the only line in the republic, in connection with which steamers ply on the lakes. San Juan del Sur is another important port on the Pacific Coast, while on the east coast in addition to Bluefields are the ports of Cape Gracias a Dios, Las Perlas, and Greytown (San Juan del Norte). There is now a continuous line connecting the port of Corinto with Chinandega, León, Managua, Masaya, Granada and Diriamba, with branches to El Viejo and Momotombo; and several other branch lines are projected. The total system in operation is 171 miles long. There are 20 miles of private railway on the Atlantic Coast near the Rio Grande, and, on the west side of Lake Nicaragua, three private steam tramways aggregating three miles in length. The steamers running on the San Juan River and on the lakes now belong to the government, as well as steamers for traffic on the Atlantic and Pacific coasts. The national railways were leased to a company for 15 years and the steamers for 25 years from 1 Jan. 1905. In 1901 an American syndicate undertook the construction of cart roads to supply communication with Matagalpa, New Segovia and other points in the interior. There are in operation about 3,637 miles of telegraph lines with 130 offices, also 805 miles of telephone lines and 29 telephone stations. The number of post offices was about 135 in 1915. The government maintains wireless telegraph stations at Managua, Granada, San Carlos, San Juan del Norte and Castillo.

Monetary System, Weights and Measures.

—The metric system of weights and measures is in use, and the present monetary system has the gold standard as its basis, the theoretical unit being the córdoba, divided into 100 centavos. The weight of the theoretical gold unit is 1.6718 grammes of gold .900 fine, or say 1.50464 grammes of fine gold, and its value in terms of United States currency is \$1.00. The circulation consists of silver coin and bank notes guaranteed to be payable in gold. Until 24 March 1913 the monetary unit was the silver peso with a nominal value of \$0.435, but the actual currency was inconvertible paper, and the exchange rates ranged from 1,000 per cent to 1,700 per cent premium for sight bills on New York. After the establishment of the National Bank of Nicaragua, Inc., certain New York capitalists undertook, through the medium of that bank, the rehabilitation of Nicaragua's finances, with the result that the present monetary system, provided for under the act of 20 March 1912, went into effect 24 March 1913. Under this system the old paper peso circulation is being retired at the rate, now invariable, of one córdoba for 12.50 pesos. To maintain the córdoba at par, there is a "conversion fund" in the United States and Europe.

Banking and Finance.—A series of economic reforms designed to remedy the unsatisfactory economic situation of Nicaragua began with the effort to put the currency on a sound basis, as described in the foregoing paragraph, and with the establishment of the National Bank of Nicaragua, which has the exclusive privilege of issuing legal tender notes, subject to the provisions of the monetary law and

for the account of the republic only. The National government owns 49 per cent of its stock, 51 per cent being the property of American bankers. It has a special issue department for the maintenance of the national currency, and its capital, \$300,000, may be increased if necessary to meet the country's needs. There are two other banks—private credit institutions that do every kind of banking business except the issuing of notes. The public treasury has been and still is in difficulties, which are ascribed to the long period of inflation, the frequent recurrence of revolutions and former bad governments. To remedy this evil the present government of Nicaragua asked a helping hand from the United States; and through the good offices of the State Department Nicaragua was enabled to enter into such relations with two important American banking houses that, with their aid, it became possible to effect a reorganization of the national railway as well as the monetary reform and the establishment of the national bank. The government's income is only about \$2,500,000, and almost all of its debts (aggregating \$13,780,662) are described as past due or "pressing." The interior debt was given recently as \$6,670,662 and the foreign debt \$7,110,000. The government, having tried repeatedly but without success to obtain a foreign loan, now expects to apply the \$3,000,000 to be paid under the canal treaty with the United States (see NICARAGUA CANAL) to the payment of those debts which are more pressing, paying off the rest with bonds. The treaty is expected to encourage the investment of American capital in Nicaragua "by insuring a continuation of present stable and peaceful conditions." Summarizing the country's natural resources, the government committee reported that the lands in the various sections are adapted to the cultivation of coffee, cacao, bananas, cocoanuts, pineapples, citrus fruits, tobacco, sugar, cotton and rubber, "the success of which has been practically demonstrated, but in a crude and limited manner"; that large areas are well adapted to the raising of cattle, being covered throughout the year with natural grasses of remarkably high food value and watered by perennial streams; that the country is analogous geologically to the State of Nevada, producing both gold and silver in paying quantities, although the mines are operated in the crudest manner; that an extensive area is heavily wooded with primeval forests of mahogany, cedar and other valuable hardwoods, pine and dye-woods; and finally that the need of additional transportation facilities is emphasized by the fact that inhabitants of the one coast are under the necessity of importing articles which are actually produced in and exported from regions along the other coast, though the two littoral regions are only 200 miles apart.

Government.—The present constitution was promulgated 12 March 1912 and came into operation on 5 April 1913, with the exception of articles 168 and 170. The Congress, composed of two chambers, the Senate of 13 members and a Chamber of 40 deputies, meets annually at Managua, 15 December. Both senators and deputies are chosen by direct popular vote, and all male citizens over the age of 21 are entitled to vote, as are also "those over 18 years of

age who are married or who can read and write." (Pan-American Union Handbook, consult *Bibliography*). The Chamber of Deputies is renewed by halves and the Senate by thirds every two years. Senators are elected for six years and must be secular citizens over 40 years of age. Deputies are elected for four years and must be secular citizens over 25 years of age. Senators and Deputies are elected directly by the vote of the people, the departments of the republic being divided into electoral districts, there being one Deputy for each 15,000 inhabitants or fraction above 8,000. Each district elects one Deputy and one alternate. Each department elects one Senator and one alternate for each two Deputies to which it is entitled. The executive power is vested in a President and a Vice-President, who must be native citizens over 30 years of age, and who are elected by direct popular vote for a four-year term, with the express provision that the President is ineligible to succeed himself in office. There are five cabinet ministers, the departments being Government, Justice, Police and Charities; Foreign Relations and Public Instruction; Treasury and Public Credit; War and Navy; Promotion (Fomento) and Public Works. A supreme court of justice holds sessions at Managua. There are also courts of appeals in León, Granada and Bluefields, besides several district or local courts. The governors of the departments are appointed by the president. They also command the local military forces.

Army and Navy.—Military service is compulsory between 17 and 55 years of age, but the law in this regard is not rigidly enforced. The period of active service is one year. In the active army there are about 4,000 men; in the reserve about 36,000. The naval branch includes 10 small gunboats or revenue-cutters, of which four are on the lakes, three on the Caribbean and three on the Pacific Coast.

Education and Religion.—Earnest efforts are being made by the government to secure competent instructors and to increase the number of school buildings. The school age, as prescribed by law, is, for each child, the period from 5 to 14 years. The principal university, with faculties of law and medicine, is located at León. Other universities are situated at Granada and Managua, with faculties of law only. There are two normal schools and eight colleges at Managua, and schools of telegraphy at Managua and Granada. A national industrial, commercial and scientific museum has been established at Managua. Altogether there are about 40 institutions for higher education and about 350 elementary schools in the republic supported by the government. These employ over 390 teachers and are attended by more than 15,000 pupils. There are a few private schools. The prevailing form of religion is Roman Catholic but freedom is accorded to all denominations and special favors prohibited to any. The Roman Church has two archbishoprics, Managua and León and two bishoprics, Granada and Matagalpa.

Population.—The estimated population on 31 Dec. 1914 was 703,540, as against 689,891 on 31 Dec. 1913. About 75 per cent of the inhabitants live in the western half of the country. The people of this section are principally of mixed Spanish and Indian extraction.

though there are a few families of pure Spanish descent and many full-blooded Indians. The population of the eastern half is composed mainly of Mosquito and Zambo Indians and negroes from Jamaica and other islands in the Caribbean, with some Americans and a small number of Nicaraguans from the west coast. The Indian population is docile and industrious, furnishing most of the country's labor. The government has made several efforts to induce immigration, but so far the result has been negligible.

History.—On 21 Jan. 1522 Gil Gonzalez Dávila with four vessels sailed westward from Panama in search of the Spice Islands. Proceeding along the Pacific Coast, after many mishaps, he reached the home of an Indian chief whose name was Nicaragua and converted him to Christianity. On the same day 9,017 natives, if we may believe the commander's assertion, accepted baptism. Nicaragua's town stood on the shore of the lake to which his name has been given. Gil Gonzales heard from the pilots he had with him that, by way of the lake and river, there was easy communication between the "North Sea" and the "South Sea"; and he wrote that only "2 or 3 leagues of very level road" separated the ocean from the lake. Until 1718 the isthmus, including the province of Nicaragua, was subject to the viceroy of Peru; after that to the Spanish representative at Bogotá. New Granada (Colombia) continued to claim certain rights in the entire isthmian territory, even up to Cape Gracias á Dios. The most interesting period is that in which occurred the invasion and temporary conquest of Nicaragua by William Walker, of Nashville, Tenn., with his 56 "emigrants." Walker became virtually dictator in 1856. His aim, disclosed to one of his associates, was to found an empire embracing Central America and Mexico. (See *Bibliography*). In 1895 the short-lived "Greater Republic of Central America" was formed by the association of Nicaragua with Salvador and Honduras. It could hardly be called a genuine union.

Three years later that attempt to displace permanently the separatist tendencies was abandoned; but again (in 1907) a similar object was sought, and on this occasion the consequences were twofold—not alone the comparatively unimportant attacks by means of which Zelaya hoped by force to drive the Central American states into a confederation under his own leadership, but also the truly important interposition of the United States and Mexico and the peace conference held at Washington in November and December. The conference was attended by delegates from all the Central American countries, and a progressive effort then and there began to safeguard the interests of all by treaty and by conventions that seemed in the main well and wisely planned. In 1908 Great Britain recognized Nicaragua's sovereignty over the Mosquito Reservation, and in the same year Nicaragua concluded treaties of commerce with Italy and Belgium. In 1909 the measure of local discontent with President Zelaya's aggressive foreign policy and perhaps even more with the monopolies and concessions that seemed oppressive in Nicaragua itself, was filled to overflowing. Among other difficulties, there was a claim advanced by citizens of the

United States; and the presence of American cruisers in the vicinity of Nicaraguan ports soon lent a threatening aspect to a demand (17 March) for the submission of that claim to arbitration. It was so referred in May. Early in October a candidate for the office of chief executive, Gen. Juan J. Estrada, secured a following that justified revolution; the Atlantic Coast towns overpromptly surrendered to him or his forces; there were several miniature battles, and finally he was proclaimed the "provisional President," although Zelaya was still to be reckoned with. On 18 November reports of the shooting of Groce and Cannon (citizens of the United States) by Zelaya's order led to a declaration (22 November) that the government of the United States would demand reparation; and on 1 December the Estrada government was recognized and Zelaya's representative at Washington was dismissed with the warning that the United States would hold those who had ordered the execution of Groce and Cannon personally responsible. On 16 December Zelaya at last surrendered the cares of office. During 1910 the ruinous civil war continued, arraying East against West, until the latter section yielded and its capital, Managua, was taken at the end of August. Then General Estrada asserted authority as Provisional President, issuing on 15 September a call for a presidential election. Before that could be held Adolfo Diaz was inaugurated as Provisional President. On 7 Oct. 1911 the National Constituent Assembly elected General Mena President for a four-year term. Many concessions that Zelaya had granted were now repealed, on the ground, of course, that the lawful authority of a president had been exceeded, to the detriment of the country's interests. Re-establishment of diplomatic relations with the United States was marked by the appointment of Elliott Northcott as minister, and San Juan del Norte, or Greytown, was made a free port. But the crisis was not past.

The election of Mena by the Constituent Assembly, as mentioned above, was simply invalid in view of a certain agreement, known as the Dawson conventions, to which Mena was a party and which provided that a quite different method should be adopted—an election by the people rather than by the Constituent Assembly—to ascertain the nation's real choice of successors to the Provisional President and Vice-President. Mena, refusing to accept his fate, revolted on 29 July 1912; the Minister of the United States thereupon demanded protection for American lives and property; Provisional President Diaz requested assistance; in response marines under Rear-Admiral Southerland were sent to Nicaragua, and the surrender of Mena with 700 men took place on 25 September at Granada—at which city also the American Red Cross supplies of food were afterward distributed. By successes at Masaya, Granada, León, Chichigalpa and Chinandega, the American forces gained mastery of the entire region along the railway from Corinto to Managua, and fighting came to an end. A prompt withdrawal of the American forces should be noted: by 1 December only a legation guard of 400 marines remained at Managua. The elections held on 2 November resulted in the choice of Adolfo Diaz for a

four-year term, beginning 1 Jan. 1913. Peace having been established, indispensable arrangements were made with foreign bondholders and the National Bank of Nicaragua, Inc., designed to act as fiscal agent of the republic, began its useful work at the capital in October 1912.

MARRION WILCOX.

NICARAGUA, Lake, in the republic of the same name, is situated in the southwest of Nicaragua, 106 feet above the Pacific Ocean, from which it is separated by a strip of land 12 miles wide. It is 110 miles long from northwest to southeast, has a mean breadth of 30 miles and a maximum of 40 miles, and ranges from 50 feet to 200 feet deep. It receives the waters of Lake Managua to the northwest by the Tipitapa River, and discharges by the San Juan River into the Caribbean Sea. There are numerous islands in the lake, the largest being Ometepe, noted for its two active volcanoes. There is steamer traffic, the lake forming a link in a route across the Isthmus of Central America. It appears that the elevation of the lake above the sea was greater in former times. In ancient times it was joined with Lake Managua and discharged its waters into the Pacific in the Gulf of Fonseca. See NICARAGUA CANAL.

NICARAGUA CANAL. References to phases of the history of this proposed inter-oceanic waterway have been made in the article NICARAGUA. Advocacy of this route as Panama's chief rival was rife during the 19th century and at the beginning of the 20th. In 1838 the mayor of New York City, Aaron Clark, together with other influential citizens, memorialized Congress in the interest of a canal planned to connect the Atlantic and Pacific oceans, recommending that negotiations should be opened between New Granada (now Colombia), Central America and the great powers of Europe, for the purpose of entering into a general agreement for the promotion of the project. President Van Buren sent John L. Stephens as an agent to the Isthmus, and Mr. Stephens, recommending the Nicaragua route as the most desirable, estimated the cost of a canal in that locality at \$25,000,000 but did not think the time favorable for undertaking such

a work, because of the unsettled and revolutionary conditions then prevailing. In 1826 John Bailey was sent out by an English company to survey the Nicaragua route, and negotiated for a concession. Though he failed in his main purpose, he remained in Central America, and in 1837 determined what he considered the best route for a canal—extending from San Juan (now Greytown) to Lake Nicaragua, across the lake to Lajas, and thence to San Juan del Sur on the Pacific. The reasons for the general interest in the question, well stated by General Goethals in the introduction to his valuable work, *The Panama Canal*, etc. (see *Bibliography*), in substance are that the settlement of the northwestern boundary question, by which the United States came into possession of Oregon, and the termination of the Mexican War, by which California was added to the Union, followed by the discovery of gold in the territory recently acquired, brought prominently to the attention of the American people the matter of transportation via the Isthmus. Communication overland was so difficult and dangerous that the main current of immigration was Cape Horn. To make the newly acquired territory more accessible, lines of steamers were inaugurated from New York to the Isthmus and from the Isthmus to California and Oregon. But the passage across the Isthmus was attended with serious personal inconveniences and suffering, as well as exorbitant charges.

The importance of making a connection across the Isthmus aroused the government to action, and arrangements were made for treaties with both New Granada (Colombia) and Nicaragua. The right of transit across the Isthmus of Panama was secured and ratifications were exchanged 10 June 1848; subsequently Nicaragua conferred on the United States, or a company of its citizens, the exclusive right to construct canals, railways, or any kind of roads, so as to open a passage and communication by land or water, or both, between the Caribbean Sea and the Pacific Ocean. In return the United States was to aid and protect Nicaragua in all defensive wars to the extent of protecting and preserving its territorial limits. The Nicaragua Treaty, however, was not approved at Washington, and the American Chargé, who had exceeded his authority in negotiating it, was removed.

His successor arranged a treaty upon the subject, and a contract with the American, Atlantic and Pacific Ship Canal Company, composed of Cornelius Vanderbilt, Joseph L. White, Nathaniel Wolfe and their associates. While the treaty was not ratified, the contract was protected, the company securing for that purpose articles of incorporation from Nicaragua. By the terms of the contract the company had the exclusive right of cutting a ship canal from Greytown to any point on the Pacific, by way of the San Juan River, Lake Nicaragua, the Tipitapa River or any other waters within Nicaragua's jurisdiction. It also gave exclusive right for the construction of rail or carriage roads, or both. The company determined that there should be a careful survey made from ocean to ocean, and that a line of location should be determined. Colonel Orville W. Childs, of Philadelphia, was appointed chief

engineer, and took charge of the work in 1850, completing it in 1852. He reached the conclusion that a ship canal by the Nicaragua route was practicable only by following up the valley of the San Juan River to Lake Nicaragua, and from the lake either southwesterly along a line through some valley extending across the dividing ridge, or northwesterly up the Tipitapa River to Lake Managua, thence through the valley extending through the head of that lake to some suitable seaport on the Pacific. "As between these two routes, an examination led him to believe that the one leading from the lake at the mouth of the Lajas River, up the eastern slope of the divide, and down the valley of the Rio Grande on the western slope to the Pacific, presented more favorable conditions than any other between Lake Nicaragua and the Pacific, and was superior to any route by way of Lake Managua. His project has been the basis of all subsequent ones. At the request of the company the President of the United States submitted Colonel Child's report of the survey and location to topographical engineers of the United States, for their inspection and opinion, and they reported in March 1852 that the plan proposed was practicable, but recommended certain changes and modifications. Nothing further was done by the American, Atlantic and Pacific Ship Canal Company toward the construction of a maritime canal, and its contract was forfeited.

The Treaty of 1884.—In December 1884 a treaty was negotiated between the United States and Nicaragua for the construction of a canal by the former, to be owned by the two contracting parties. While the treaty was pending in the Senate in 1885 it was withdrawn by the President for the reason that the perpetual alliance with Nicaragua which the treaty proposed, as well as the protection of the integrity of the territory of that state, was contrary to the policy of the United States. In 1887 Nicaragua granted a concession to A. G. Menocal and others for the construction of a ship canal from Greytown to Brito, and, as the canal would affect the territory of Costa Rica also, a similar concession was secured from this republic in 1888. The Maritime Canal Company of Nicaragua was organized and incorporated by the Congress in 1889, for the construction of the canal. Actual construction was begun in October of 1889 and was continued for over three years, but comparatively little was accomplished. Work was suspended during 1893. Several attempts were made to secure government aid, but without avail. A bill for this purpose, after its passage by the Senate in 1895, was pending in the House of Representatives (where it subsequently failed) when an amendment was made to the Sundry Civil Bill which provided for a board of three officers, one from the army, one from the navy and one from civil life, to make a personal investigation, and to examine the "plans, profiles, sections, prisms and specifications" for the various parts of Menocal's plans for the Nicaragua Canal, for the purpose of ascertaining "the feasibility, permanence, and cost of construction and completion of the canal." The board appointed consisted of Lieut.-Col. William Ludlow, corps of engineers, army of the United States, M. T. Endicott,

civil engineer, navy of the United States and Alfred Noble, civil engineer. The board found it impracticable, within the time fixed by law and with the limited means appropriated for its work, to make a full and thorough examination of the route and obtain the necessary data for a final project, and recommended that further explorations should be undertaken and observations made, to collect information and data, so as to determine the location and cost of the work. The board submitted, however, a tentative estimate of the cost.

Carrying out the recommendations of the board organized under the Sundry Civil Act of 1895, Congress appropriated by the act of 4 June 1897 funds to "continue the surveys and examinations authorized by the act approved 2 March 1895 into the proper route, feasibility, and cost of construction of the Nicaragua Canal, with a view to making complete plans for the entire work of construction of such canal as therein provided." The President appointed Admiral John G. Walker, Capt. Oberlin N. Carter (replaced 18 October by Col. Peter C. Hains) and Prof. Lewis M. Haupt to constitute the commission required by the law. This board submitted its report in May 1899, with the necessary detailed data and estimates for the construction of the Nicaragua Canal. The act of 3 March 1899 authorized the President to investigate particularly the Nicaragua and Panama routes with a view to deciding which was the more practical and feasible route for a canal connecting the Atlantic and Pacific Oceans, together with the approximate and probable cost of construction of a canal by each of the two or more routes. In compliance with this act the President appointed Admiral J. G. Walker, Samuel Pasco, Alfred Noble, George S. Morison, Col. Peter C. Hains, Prof. William H. Burr, Lieut.-Col. O. H. Ernst, Prof. Lewis M. Haupt and Emory R. Johnson as a commission to carry out the wishes of Congress as expressed by the act. This board submitted its report on 16 Nov. 1901. With regard to the choice of routes, the board reported: "There are certain physical advantages, such as a shorter canal line, a more complete knowledge of the country through which it passes, a lower cost of maintenance and operation, in favor of the Panama route, but the price fixed by the Panama Canal Company for a sale of its property and franchises is so unreasonable that its acceptance cannot be recommended by this commission. After considering all the facts developed by the investigations made by the commission, and having in view the terms offered by the New Panama Canal Company, this commission is of the opinion that the most practicable and feasible route for an Isthmus Canal to be under the control, management and ownership of the United States, is that known as the Nicaragua route."

The price fixed by the New Panama Canal Company was \$109,141,500; but the board was of the opinion that the value of the French property referred to was only \$40,000,000; and if the figure had been acceptable the report leaves no doubt that the recommendation of the board would have been different. Because of lack of funds the New Panama Canal Company could not carry the work to completion, and their only hope for any return for the

investment was from the United States. In these circumstances the company on 4 Jan. 1902 declared itself ready to transfer to the United States its properties and concessions on the payment of \$40,000,000. This put the matter in a new light, and the Isthmian Canal Commission was called together, changed its previous recommendation, and on 18 Jan. 1902 reported that in view of "conditions that now exist and all the facts and circumstances upon which its present judgment must be based, the commission is of the opinion that the most practicable and feasible route for an Isthmian canal, to be under the control and management and ownership of the United States, is that known as the Panama route."

The "Nicaragua Canal" Treaty of 1916. On 26 Feb. 1913 the Senate of the United States took into consideration a proposed new convention or treaty with Nicaragua, negotiated with the object of granting, on the one side, and of securing, on the other side, to the United States as an exclusive privilege the perpetual right to construct a canal across Nicaragua. That convention, signed in 1914 and ratified by Nicaragua but not by the Senate of the United States until 1916, made provision for the payment of \$3,000,000 for the canal option and (among other things) for a naval station on the Gulf of Fonseca, at which begins the boundary with Honduras and upon which the Republic of Salvador also looks out. As a matter of fact, the control of that important gulf is shared among the three nations of the old "Greater Republic of Central America" mentioned above; at the northern end of the route Costa Rica's boundary must be crossed; and this division of interest and control is but a reminder of difficulties that have been encountered whenever the government of the United States in the past, before the selection of the Panama route, endeavored to make satisfactory arrangements for cutting a canal by way of Lake Nicaragua. Ratification of the "Convention between the United States and Nicaragua" was advised by the Senate, with amendments, 18 Feb. 1916; on 19 June 1916 the convention was ratified by the President; on 24 June 1916 it was proclaimed (Treaty Series, No. 624, Washington 1916). In Article I "The Government of Nicaragua grants in perpetuity to the Government of the United States, forever free from all taxation or other public charge, the exclusive proprietary rights necessary and convenient for the construction, operation and maintenance of an interoceanic canal by way of the San Juan River and the Great Lake of Nicaragua or by way of any route over Nicaraguan territory." In Article II the government of Nicaragua "leases for a term of 99 years to the government of the United States the islands in the Caribbean Sea known as Great Corn Island and Little Corn Island; and the government of Nicaragua further grants to the government of the United States for a like period of 99 years the right to establish, operate and maintain a naval base at such place on the territory of Nicaragua bordering upon the Gulf of Fonseca as the government of the United States may select. The government of the United States shall have the option of renewing for a further term of 99 years the above leases and grants upon the expiration of their respective terms,

it being expressly agreed that the territory hereby leased and the naval base which may be maintained under the grant aforesaid shall be subject exclusively to the laws and sovereign authority of the United States during the terms of such lease and grant and of any renewal or renewals thereof." Article III relates to the payment above mentioned, etc. The consent of the Senate of the United States to the ratification of this convention was given with the proviso "that nothing in said convention is intended to affect any existing right" of Costa Rica, Salvador and Honduras.

MARRION WILCOX.

NICARAGUA WOOD, called also Peachwood, a bright-red dyewood native to Nicaragua, and a species of *Cesalpinia*. It resembles Brazil wood botanically and in its properties, but yields a smaller amount of coloring matter.

NICATOR. See DEMETRIUS II.

NICCOLINI, Giovanni Battista, jō-vān'nē bāt-tēs'tā nēk-kō-lē'nē, Italian dramatist: b. San Giuliano, near Pisa, 31 Oct. 1782; d. Florence, 20 Sept. 1861. He studied at the University of Pisa; published his first poem in 1804; and became in 1807 professor of history and mythology in the Academy of Fine Arts in Florence. His chief writings are his patriotic tragedies and his lyric verse. Among the former are: 'Nabucco' (1816); 'Antonio Foscarini' (1827); 'Giovanni da Procida' (1830), and 'Arnoldo da Brescia' (1843), the last a bitter attack on the Guelph party and his most famous work. Among his other verse is 'Béatrice Cenci,' a free translation of Shelley; 'Rosmund a d'Inghilterra' (1838); and 'Filippo Strozzi' (1847). Strongly anti-papal in tone, in popular estimation his plays were esteemed rather above their merits, and their fervid idealism does not help their capabilities for acting. Niccolini wrote also some volumes of criticism. The best collected edition is by Gargioli (1862 et seq.). Consult the biography and critique by Vannucci (1866).

NICCOLITE, a native arsenide of nickel, having the chemical formula NiAs. The crystals, when found, belong to the hexagonal system; but the mineral usually occurs massive. It is reddish in color, and opaque with a metallic lustre. It has a hardness of from five to five and five-tenths, and a specific gravity of from seven and three-tenths to seven and seven-tenths. Niccolite occurs in Saxony, Bohemia,

Sweden, Cornwall, Scotland, Spain, Chile and the Argentine Republic. In North America it is found at Chatham, Conn., at Franklin Furnace, N. J., at Silver Cliff, Colo., and at Tilt Cove, Newfoundland. (Also known as "Kupfernickle," "false copper," or "devil's copper").

NICCOLLS, Samuel Jack, American Presbyterian clergyman: b. Greenfield Farm, Westmoreland County, Pa., 3 Aug. 1838; d. Old Forge, Adirondacks, N. Y., 19 Aug. 1915. He was graduated from Jefferson College in 1857; studied theology at Western Theological Seminary, and was ordained to the Presbyterian ministry in 1860. He was subsequently pastor at Chambersburg, Pa., and chaplain of the 126th Pennsylvania volunteers in 1862, and in 1865 became pastor of the 2d Presbyterian Church, Saint Louis. He was moderator of the Presbyterian General Assembly in 1872. In March 1915, he celebrated the 50th anniversary of his pastorate in Saint Louis. He published 'Women's Position in the Church,' 'The Eastern Question in Prophecy,' etc.

NICCOLO, Alunno, nēk'kō-lō a-loon'nō, Italian painter: b. Foligno about 1430; d. there in 1502. He is also called Niccolò Alunno, Niccolò di Liberatore and Niccolò da Foligno. According to tradition his first teacher was Bartolommeo di Tommaso. Later he fell under the influence of Benozzo. Niccolò is an Umbrian and the true representative of the art of Foligno. He is said to have been the teacher of Perugino, Pinturicchio and Andrea di Luigi; and, consequently, he is one of those who prepared the way for others of greater note, one of those who formed the Umbrian School which culminated in Perugino and Raphael. Alunno's first altarpiece at Deruta, representing the Virgin attended by Saint Francis and Saint Bernardino (deprived of its wings and predella), is dated 1458, a 'Madonna with Saints,' in the Brera Gallery, Milan, was painted in 1465; an altarpiece, 'Annunciation,' dated 1466, is in Santa Maria Nuova at Perugia and is remarkable for the graceful form of Gabriel with his crisp, wavy hair bound by a crimson band, and seraphs resembling Gozzoli's work and the altarpiece of Montepare is now in the Vatican Museum. This is dated 1466, and signed 'Nicholas Fulginos. After 1471 the influence of the decorative Crivelli begins to show, as in the altarpiece in the Duomo, Gualdo, and in the 'Annunciation,' Bologna Gallery. The altarpiece in Saint Niccolò, Foligno (of which the predella is in the Louvre), representing Saint Nicholas and the Infant Christ and painted in 1498, may be considered as Alunno's masterpiece in his second eclectic style. One of his latest works is the 'Madonna with Angels and Saints' (1499) in a church at La Bastia, between Assisi and Perugia. A 'Pieta,' of which only fragments remain, in the cathedral of Assisi, was considered one of his best works by his contemporaries. Vosarie says of the two angels represented here that no painter in Italy could have expressed their emotion more beautifully. Niccolò also painted standards called 'Gonfaloni,' which were used in religious ceremonies. One of the finest of these was presented to the Bologne Gallery by Pope Pius IX. Consult Rossi, Adamo, 'Pittori di Foligno' (Perugia 1872); Blanc, Charles, 'École ombrienne'; Crowe and Cavalcaselle, 'A New

History of Painting in Italy,' edited by Edward Hutton, Vol. III, pp. 163-174 (London and New York 1909).

NICCOLO (nēk'kō-lō) OF AREZZO, ā-rēt'sō, Italian sculptor and architect: b. Arezzo, 1350; d. 1417. He worked on the sculpture of the cathedral at Florence, and executed two statues for the campanile (1383). His relief of the Virgin in the façade of the Santa Maria della Misericordia is remarkable for a freedom and elegance which point to a distinct advance in Italian sculpture.

NICCOLÒ DE' NICCOLI, dā nēk'kō-lē, Italian humanist: b. Florence, 1363; d. there, 23 June 1437. He rendered literature most important service by ransacking Europe for manuscripts of the principal Greek and Latin works. At his death he presented to the public his library, which became the basis of the Marcian library, one of the most famous of Italy. Niccolò copied and corrected numerous manuscripts with his own hand, and thus came to be regarded as the originator of textual criticism of the ancient authors.

NICE, nī'kē, a Greek goddess. See **NIKE**.

NICE, nēs, Asia Minor. See **NICÆA**.

NICE, nēs', France, a city, seaport, and health resort, capital of the department of the Alpes Maritimes, beautifully situated near the base of the Maritime Alps, on the Mediterranean, and on both sides of the Paillon or Paglione, a mountain torrent of short and rapid course, 140 miles east by north of Marseilles. It is divided into the Old Town, on the left bank of the Paglione, and the New Town, on the right. Both quarters, but more especially the New Town, have of late years been much extended. The streets of the former are mean-looking compared with those of the latter, in which there are wide streets and boulevards, and lofty and handsome houses. The quays that border the Paglione are lined with gay shops, and between these and the sea the stream is entirely covered over, leaving a wide space or square where is a handsome public casino, with a fine winter garden. The Croce de Marbre commemorates the reconciliation of the Emperor Charles V and Francis I by Pope Paul II. There are statues of Masséna, Garibaldi and Carnot. At the mouth of the stream there is a public garden, and westward along the sea-front a fine promenade, the Promenade des Anglais, bordered with handsome hotels and villas. On a pier or jetty projecting from the public garden is a fine new casino. Public buildings include a cathedral, theological and teaching seminaries, natural history museum, observatory, several theatres, public library with 60,000 volumes, etc. Nice possesses some silk, cotton and paper mills; many oil mills and manufactories of leather, silk, soap, liqueurs, dyes, essences, perfumery, etc. Immense quantities of flowers are grown. The harbor or port is separated from the rest of the town by the Castle Hill (320 feet), which has been laid out into beautiful grounds commanding magnificent views and crowned by the remains of an old castle. The harbor has recently been greatly improved, and is available for vessels of 5,000 tons. The exports by sea consist principally of olive-oil. Nice is much

resorted to in winter by foreigners, particularly English. The carnival of Nice, which begins on Shrove Tuesday, lasts eight days. Owing to sudden changes of temperature (mean temperature 60° F., ranging from 27½° to 88°), its climate is unsuitable for those laboring under pulmonary and bronchial complaints, but patients suffering from chronic rheumatism, gout and paralysis derive benefit. Pop. 142,940.

The ancient Ligurian town of Nicæa, founded by a colony of Phocæans from Massalia (Marseilles), became subject to Rome in the 2d century B.C. It was in the hands of the Saracens during the greater part of the 10th century. Then, after existing as an independent city, it acknowledged the supremacy of the Counts of Provence and the House of Savoy (1388). In 1543 it was taken and pillaged by the Turks. Later, from 1600 onward, it was repeatedly taken by the French; and they kept possession of it from 1792 to 1814. In 1860 it was ceded to France by Sardinia (Savoy). Masséna was born near the city, and Garibaldi in it. Consult Hole, 'Nice and her Neighbours' (1881); Loveland, 'The Romance of Nice' (1912); Moris, 'Nice' (1899); Nash, 'Guide to Nice' (1884).

NICE, Councils of. See NICÆA, COUNCILS OF.

NICENE (nī'sēn) CREED, a detailed doctrine embodied in the liturgies of the Catholic, Oriental and Anglican churches, and generally accepted by Protestants. While not absolutely identical with the original Creed formulated at the Council of Nicæa (q.v.) in 325 A.D., against the Arian heresy, the main points of doctrine therein agreed on are embodied in it. Prior to its adoption, the several churches had their own doctrinal formulæ. The final clauses after "And I believe in the Holy Ghost" were added at the Council of Constantinople (381). See **ARIUS**; **CREEDS**; **FILIOQUE**.

NICEPHORUS, nī-sēf'ō-rūs, Greek historian: b. 758; d. 829. He is generally known as Nicephorus Constantinopolitanus, was secretary to the Empress Irene, and in 806 was elected patriarch of Constantinople. The violent Emperor Leo V deposed him, and he retired to a cloister in 805. To this retirement we owe his invaluable 'Chronologia Compendiaria' and 'Breviarium Historicum.'

NICEPHORUS I, Byzantine emperor of the first decade of the 9th century A.D.; d. 26 July 811. He is often called 'Logothetes,' this being his title as financial secretary to Irene, whom he succeeded on the throne October 802, owing to a sudden revolution. His experience in finance aided him in the imposition of heavy taxes, and he sided with the iconoclastic party. These two courses made him unpopular, and his unpopularity was increased by his non-success in external affairs. In 803 a part of Italy was assigned by treaty to Charlemagne; in 806 was forced to sign a humiliating peace with the Arabs, and in 811 was defeated and killed by the Bulgarians under Khan Krum.

NICEPHORUS II, Phocas, Byzantine emperor: b. 912; d. 10 Dec. 969. He was of Capadocian descent, and, like his father, Bardas Phocas, proved himself a great general. During the reigns of Constantine VII and Romanus II he fought the Arabs in Asia and southern

Italy, and in 961 recaptured the island of Crete from the Saracens. In 963 he returned to Constantinople after the death of Romanus II, was proclaimed emperor in August, and in September married Romanus' widow, Theophano. As emperor Nicephorus' military career was no less brilliant than before; he renewed the war against the Arabs, won all of Cilicia, and in 969 captured Antioch; and was equally successful against the Bulgarians and Macedonians. At home his heavy taxes to carry on these campaigns and his bold tampering with ecclesiastical funds aroused monks and people against him. He was assassinated by his wife's paramour and his own kinsman and general, John Tzimisce. Nicephorus was not only a general but a statesman and diplomat, as is evidenced by his work 'Legatio,' edited by Pertz (1839). Consult Schlumberger, 'Nicephore Phocas' (1890).

NICEPHORUS III, Botaniates, Byzantine emperor of the 11th century. He was a general grown old in the service, when in 1078 he successfully plotted against Michael VII and became emperor. His reign of three years was filled with contention against his rivals at home and with Robert Guiscard abroad. He was forced to abdicate in favor of Alexis Comnenus in April 1081, and spent the few months that remained to him in a monastery.

NICETAS ACOMINATUS, nī-sē'tas ā-kōm-ī-nā'-tūs, Byzantine historian: b. Chonæ (hence called **CHONIATES**), in the middle of the 12th century; d. Nicæa, 1216. He was a resident and official of Constantinople up to 1204, when the city was captured and he removed to Nicæa. His excellent history of the Byzantine Empire from 1118 to 1206, completing Zonaras, is his most important work; it is edited by Bekker (1835).

NICHIREN, nīch'ī-rēn, Japanese religious reformer: b. 1222 A.D.; d. 1282. He founded a Buddhist sect, the Nichivien-shiu. He appears to have been a fanatic religionist of a persecuting temper, and to have quarreled bitterly with other sects. Two exiles were imposed upon him for his subversive doctrines. The central doctrine of his teaching is that all life may attain to being a Buddha by repeated transmigrations. Final salvation is reached by prayer and obedience to the law. Nichiren is revered, but not worshipped, by his followers, whose chief shrines are at Ikegami, near Tokyo. A translation of the sacred book of the sect is printed in Max Müller's 'Sacred Books of the East.'

NICHOL, nīk'ōl, John, Scottish lecturer and author: b. Montrose, Scotland, 8 Sept. 1833; d. London, 11 Oct. 1894. He was educated at Glasgow University and Balliol College, Oxford, being graduated with honors from the latter in 1859. From 1862 to 1889 he was professor of English literature in Glasgow University, later lectured widely in England and Scotland on literary subjects, and was prominent in the university extension. He visited the United States several times, and during the Civil War warmly supported the Northern cause. He prepared the article on 'American Literature' for the 'Encyclopedia Britannica,' which has been separately published; and also wrote 'Fragments of Criticism' (1860); 'Hannibal' (1872), a dramatic

poem; 'Tables of European Literature and History' (1876); 'Byron' in the 'English Men of Letters' series (1880); 'Robert Burns' (1882); 'Francis Bacon' in 'Philosophic Classics for English Readers' (1888-89); 'Kant' (1889), and 'Carlyle' in the 'English Men of Letters' series (1892). Consult his 'Memoir' by Knight (1896).

NICHOL, John Pringle, Scottish astronomer; b. Brechin, Forfarshire, 13 Jan. 1804; d. near Rothesay, 19 Sept. 1859. Originally educated for the Scottish Church, at King's College, Aberdeen, he turned his attention to astronomy and in 1836 was appointed professor of astronomy in Glasgow University, a post which he retained with great credit till his death. He lectured in the United States 1848-49. Among his works may be mentioned 'The Architecture of the Heavens' (1838); 'Phenomena of the Solar System' (1838); 'The Stellar Universe' (1847); the 'Planetary System' (1851), and 'The Planet Neptune' (1855). These have the merit of being written in a very attractive and interesting style, and obtained a wide popularity. He likewise edited a 'Cyclopædia of Physical Sciences' (1857).

NICHOLAS, nīk'ō-lās, a proselyte of Antioch, one of the seven deacons (Acts vi, 5). He is sometimes charged, though on insufficient evidence, with founding the sect of Nicolaitans alluded to in Rev. ii, 15.

NICHOLAS, Saint, a popular saint revived by both Greeks and Latins on 6 December. Saint Nicholas belongs to the 4th century of the Christian Era. The accounts of his life are purely legendary. According to tradition he was a native of the city of Patara, in Lycia, Asia Minor, was devotional in early youth and entered the monastery of Sion near Myra. In the course of time he became an abbot and subsequently was elected archbishop of the metropolitan church of Myra. This was in the time of the Emperor Diocletian under whom Saint Nicholas was persecuted, tortured and kept in prison until the more tolerant reign of Constantine. He is said to have been present at the Council of Nicæa (325), but this is unconfirmed by historians.

The history of Saint Nicholas did not end with his death and burial. His relics were preserved with great honor at Myra until the end of the 11th century, when some merchants of Bari, on the Adriatic, moved by a pious indignation, made an expedition to the coast of Lycia; and, by means of a ruse, seized his remains and carried them off to Italy. Landing at Bari they deposited these sacred relics in the church of Saint Stephen (9 May 1087). On that day it is said that 30 persons were cured of distemper through imploring the intercession of Saint Nicholas. Since that time his tomb at Bari has been a pilgrimage place. Perhaps no saint enjoys so great a popularity as Saint Nicholas. He is the patron saint of Russia. He is regarded as the special guardian of virgins, of children and of sailors. Scholars were also under his protection; and he even came to be regarded as the patron of robbers, from an alleged adventure with thieves, whom he compelled to restore some stolen goods to their proper owners. In consequence thieves were called in the Middle Ages "clerks of Saint Nicholas." In art Saint Nicholas is represented

with various attributes. His most usual appearance is standing in his splendid episcopal attire by the side of three children in a tub. The interpretation of this is found in the legend that Saint Nicholas miraculously restored to life three youths, sons of rich parents, who had been murdered, cut up and hidden in a salting tub, by a wicked innkeeper of Myra, in whose house they had taken lodging for the night while on their way to Athens to continue their education. From this circumstance Saint Nicholas became the patron and guardian of children. The legend regarding his care of virgins and the connection of his name with the giving of presents in secret is told as follows: A nobleman in the town of Patara had three daughters, but was so poor that he was unable to provide them with suitable marriage portions. He was on the point of abandoning them to a sinful course of life when Saint Nicholas heard of it; and, going secretly to the nobleman's house at night, he threw a purse of gold into an open window. This fell at the feet of the father who used it for the dowry of the eldest daughter. On the second night Saint Nicholas threw a second purse for the second daughter; and on the third night another for the third daughter. On this occasion the nobleman caught Saint Nicholas in the act and held him by his robe. Saint Nicholas made him promise that he would inform no one of his munificence. From this incident it became the custom for the older members of a household to place presents in the shoes or stockings of their young relatives, who on discovering them in the morning were pleased to attribute them to the generosity of Saint Nicholas. From this same exhibition of munificence Saint Nicholas is often represented as bearing three golden balls which later became the sign of the pawnbrokers. Hence Saint Nicholas is sometimes considered as the patron of pawnbrokers.

An important function of Saint Nicholas was to guide mariners. Hence in many seaport towns there are churches dedicated to Saint Nicholas in which sailors hang up votive pictures and return thanks for preservation at sea. It is said that Saint Nicholas, when making a voyage to the Holy Land, caused a terrible tempest to abate; and at another time appeared and saved some mariners who had invoked his aid. Churches dedicated to Saint Nicholas are numerous in all countries.

On Saint Nicholas' Day in ancient times a singular ceremony used to take place. This was the election of the Boy Bishop or *Episcopus Puerorum*, who from 6 December to Innocents or Childermas Day (28 December), exercised a burlesque episcopal jurisdiction; and, with his juvenile dean and prebendaries, parodied the various ecclesiastical functions and ceremonies. These ceremonies, ridiculous to modern minds, were encouraged as object lessons and participated in by the clergy themselves. The election of the Boy Bishop prevailed throughout the English cathedrals and grammar schools; but it was most particularly observed at Sarum (Salisbury). A full description of the mock ceremonies is preserved in the 'Processional of Salisbury Cathedral,' where the service of the Boy Bishop is set to music and printed. Strype in his 'Ecclesiastical Memorials' says that in 1556 "on the eve

of his day Saint Nicholas, that is, a boy habited like a bishop, went abroad in most parts of London, singing after the old fashion, and was received by many ignorant but well disposed people into their houses, and had as much good cheer as ever was wont to be had before." With the establishment of Protestantism in England, the pastime of the Boy Bishop ended. In France the Boy Bishop was not abolished until 1721, and continued in Germany until late in the 18th century.

The Feast of Saint Nicholas at Bari is one of the principal ecclesiastical festivals of southern Italy; and the grand prior of Saint Nicholas at Bari is one of the chief ecclesiastical dignitaries of Italy.

The celebration of Saint Nicholas Day has long been general in the Low Countries and Rhine provinces; but the growing concentration of the winter festival on Christmas Day and the rise in importance of the Christmas tree during the last 200 years has caused the Saint Nicholas customs to be absorbed into the Christmas celebration. In Belgium and Holland Saint Nicholas Day is still the day of joy and not Christmas. "On the eve of his festival day," writes an authority, "Saint Nicholas makes his tour, visiting palace and cottage. Frequently in the early evening he makes a preliminary visit in his bishop's robes, with pastoral staff and mitre, at each house, making inquiries concerning the conduct of the children, giving appropriate praise or warning, and promising on the following morning to give substantial reward. When he is gone, the children place receptacles for the gifts which Saint Nicholas is expected to let fall down the chimney. The receptacle varies in different places. Sometimes shoes are neatly polished for the purpose, at other times plates, or baskets, or stockings, or specially made shoes of porcelain are set on the bed, in the open chimney, before the door of a room or merely in the corner of a room. Saint Nicholas' steed, variously conceived of as a gray horse or a white ass, is not forgotten. For him the children put water and hay, or carrot, or potato peeling, or a piece of bread in the shoe, or basket, or stocking. In the morning from the tipped-over chairs and general disarray in the room it is evident that Saint Nicholas has been present. Replacing the oats, or hay, or carrot are found sweets and playthings for children that have been good, obedient and studious during the year. In the case of bad children, rods are left and the fodder is untouched."

Saint Nicholas' robe — his "tabard" — enables him to travel from place to place instantly. In Holland he is supposed to use a horse for his journey at night over the roofs of the houses. Belgium and Holland have special cakes and sweets for the Saint Nicholas season. Life-sized figures of Saint Nicholas are frequent in front of shop windows and in some places a man dressed like the saint goes about the streets on a white horse with presents. The Dutch settlers brought the Saint Nicholas customs to New York, whence they spread to other parts of the United States and became amalgamated with the Christmas customs from other countries. The American "Santa Claus" is a corruption of the Dutch *San Nicolaas*. "Santa Claus," writes McKnight, "the name derived from Saint Nicholas through the familiar use of

children in Teutonic countries, crossed to America. The exact route followed by him is somewhat open to question. On the way he traded his gray horse or ass for a reindeer and made changes in his appearance. In America he has made himself very much at home; and, according to the explanation most generally accepted, from America he recrossed the Atlantic to England, whence he has journeyed to the most distant parts of the British Empire, to India and to Australia, where he is as familiarly known as in America." The immortal poem of 'The Night Before Christmas,' by Clement C. Moore, makes him a jolly elf "Saint Nick," who rides "in a miniature sleigh drawn by eight tiny reindeer."

Consult Schnell, Eugen, 'St. Nickolaus' (Revensburg 1886); Laroche, Jules, 'Vie de Saint Nicholas' (new ed., Paris 1893); Gaeta, 'S. Nicolo' (Naples 1904); Falcorius, N. C., 'Sancti Nicolai' (Naples 1751); Cahier, C., 'Caracteristiques des Saints' (Paris 1867); McKnight, George Harvey, 'St. Nicholas' (New York 1917). See also BEFANA.

NICHOLAS, Saint, of Myra, one of the chief saints of the Greek Church, called the Wonder-Worker and venerated by the Roman Catholic Church: b. Parara, province of Lycia, in Asia Minor, toward the end of the 3d century; d. Myra, 6 Dec. 345 or 352. He was a bishop of Myra, imprisoned during the Diocletian persecution and set at liberty by Constantine the Great. He was present at the Council of Nicaea (325). He is venerated in the East and West as a saint and miracle worker, the patron of little children, unwedded maidens and sailors, and of Russia and Greece. In 1087 his body was stolen by Italian merchants and taken to Bari in South Italy 9 May. His festival, the anniversary day of his death, is still kept with special ceremonies in Italy, Germany, Switzerland and the Low Countries. He is the original of the Christmas present-bringer, "Santa Claus," this name being a corruption from the Dutch, the early colonists bringing the observance of Saint Nicholas' day to America. Nicholas or old Nick being a cant name for the Devil. Saint Nicholas' clerks became a cant name for thieves. Consult Praxmarer, 'Der Heilige Nikolaus und seine Verehrung' (1894); and Chambers' 'Book of Days.' See BOY BISHOP.

NICHOLAS, the name of five popes, as follows:

NICHOLAS I, Saint: b. Rome; d. there, 867. He succeeded Benedict III in 858. He was of a resolute disposition and successfully upheld the papal authority. He excommunicated Photius, patriarch of Constantinople, who had usurped that see after the deposition of Ignatius by the Emperor Michael III. He restored the violated rights of Thietberga, the unjustly divorced wife of Lo Lothair of Lorraine, brother of the Emperor Louis II, and that though they took arms against him and laid siege to Saint Peter's itself. Consult Lämmer, 'Nikolaus I und die byzantinische Staatskirche seiner Zeit' (1857); and 'Lives' or studies by Greinacher (1909); Leroy (1898); and Roy (1901).

NICHOLAS II (GERHARD, gër'härt, Fr. zhā-rär): b. Burgundy; d. Florence, 19 July

1061. A canon of Liège he became bishop of Florence in 1046 and succeeded Stephen X in the papal chair in 1059. He was opposed by a rival, called Benedict X, the choice of some of the Roman nobles, but being disavowed by the Council of Satri, Benedict was obliged to forego his claim. Hildebrand was the counsellor of Nicholas throughout his pontificate, and through his direction a council was assembled at Rome in 1059 which restricted the papal election to the college of cardinals.

NICHOLAS III (GIOVANNI GAETANO DEGLI ORSINI): d. 1280. He came of a noble Italian family and in 1277 was elected in succession to John XXI. From the emperor, Rudolph of Hapsburg, he succeeded in obtaining the cession of Romagna and the exarchate of Ravenna, and he deprived Charles d'Anjou, king of Naples, of the vicariate of Tuscany. He sent missionaries to Persia and China (1278) and attempted to originate a crusade. He was succeeded by Martin IV.

NICHOLAS IV (GOROLAMO MASCI): b. Ascoli, Italy; d. 1292. While very young he entered the order of Saint Francis and in 1274 became its general. He was made a cardinal by Nicholas III and bishop of Palestrina by Martin IV, and in 1288 was elected Pope. He was the first Franciscan pontiff. He excommunicated James of Aragon and his followers in Sicily and promoted the claims of Charles II of Anjou to that kingdom. He sent missionaries to the Bulgarians, Tartars and Chinese. Acre, the last Christian stronghold in the East, fell into the hands of the Saracens during his pontificate, and unsuccessful efforts to excite a new crusade are supposed to have hastened his death.

NICHOLAS V (TOMMASO PARENTUCELLI): b. probably at Sarzana, near Pisa, 1398; d. 1455. He was the cardinal-bishop of Bologna and succeeded Eugenius IV in 1447. During his pontificate the last anti-pope, Felix V, made submission and the Council of Basle was dissolved (1449). Three conspiracies were formed against him by Stefano Porcaro, who, after being twice pardoned, was executed (1453). The fall of Constantinople (1453) led to strenuous effort by Nicholas to arouse the princes of Europe to succor their brethren in the East; but the age of chivalry was past and his appeals fell on deaf ears. He was one of the most learned men of his time, collected books and manuscripts, and ordered translations to be made of the Greek classics. The Vatican library was also founded by him, and he embellished Rome with numerous fine edifices.

NICHOLAS V (PIETRO RAINALDUCCI), anti-pope, 1328-30: b. Corbara in the Abruzzi; d. Avignon, October 1333. A married man, he separated from his wife in 1310, joined the Franciscan Order and acquired fame as a preacher. During the papal exile at Avignon, Louis of Bavaria nominated him Pope against John XXII. He was elected by an assembly of priests and laymen and was consecrated by the bishop of Venice in Saint Peter's Cathedral, 12 May 1328. In April 1329 he was excommunicated, until, submitting with a rope around his neck to John XXII, 25 Aug. 1330, he received the pardon which was refused to Lotis, who temporised for a retraction. The anti-pope re-

mained in retirement until his death.

NICHOLAS I, king of Montenegro: b. Niegush, the ancient home of the long-reigning family of Petrovitch-Niegush, 25 Sept. 1841; d. Antibes, France, 2 March 1921. He was the son of Mirko Petrovitch, a famous Montenegrin soldier, and brother of Danilo II. The latter was assassinated 13 Aug. 1860, leaving no male heir. Mirko Petrovitch having resigned his claim to the throne, Prince Nicholas succeeded. Owing to the influence of the wife of Danilo II, the Princess Darinka, Prince Nicholas had been educated in Paris at the Academy of Louis-le-Grand and was in Paris when his uncle was murdered. He returned to Cetinje, Montenegro, and in the same year was married to Milona, daughter of Peter Valsetitch, president of the Council of State. In 1862 he distinguished himself in the campaign against Turkey and on one occasion narrowly escaped with his life. In 1876 he declared war against Turkey and in 1877-78 captured Nikshitch, Antivari and Dulcigno. This war, in which his military reputation was greatly increased, resulted in a considerable extension of the frontiers of Montenegro and the acquisition of a seaboard on the Adriatic. In 1896 he celebrated the bicentenary of the Petrovitch dynasty and attended the coronation of the Tsar Nicholas II. In 1898 he visited Queen Victoria at Windsor Castle. On 28 Aug. 1910 on the 50th anniversary of his reign, he changed his title from that of Prince to King, in accordance with a petition from the National Assembly or Skupshtina. Nicholas I, his family and his government fled from Montenegro in December 1915, when the country was overrun by the Austro-Germans. Since that time he has lived in France and the Montenegrin government has been at Neilly-sur-Seine. On 8 Nov. 1918, Nicholas declared himself in favor of a union of Montenegro with the new state of Jugo-slavia with each component state independent as to religion, education and territorial integrity. On 29 November he was deposed by the Skupshtina, the Montenegrin National Assembly, which declared for a union of Montenegro with Serbia under King Peter. The family of Nicholas I was included in the act of deposition.

He had three sons and five daughters. The eldest son, Prince Danilo, married (1899) Duchess Jutta of Mecklenburg-Strelitz; Princess Helena is married to King Victor Emmanuel III of Italy; Princess Anka to Prince Francis Joseph of Battenberg; Princess Militza to the Grand Duke Peter Nikolaievitch, former commander of the Russian armies, and Princess Stana to Duke George of Leuchtenberg. Of him James D. Bouchier writes: "The descendant of a long line of warriors, gifted with a fine physique and a commanding presence, a successful military leader and a graceful pose, King Nicholas possesses many characteristics which awoke the enthusiasm of the impressionable Servian race, while his merits as a statesman have received general recognition." His writings hold a high place in modern Slavonic literature. They include historical dramas, poems and ballads. Among them are 'Balkansa Tzaritza' and 'Kniaz Arvaniti,' dramas; 'Skuphene Pesme' and 'Nova Kola,' songs; and 'Haidana, Potini Aben-serage' and 'Pesnik i Vila,' poems.

NICHOLAS I, Pavlovitch, Tsar of Russia: b. near Saint Petersburg, 6 July (25 June) 1796; d. Saint Petersburg, 2 March 1855. He was third son of Paul I. He married in 1817 the Princess Charlotte, daughter of Frederick William III of Prussia. The Crown was relinquished by his elder brother, Constantine, and on 24 Dec. 1825 he entered upon his reign and on 3 Sept. 1826 was crowned at Moscow. On 26 Dec. 1825 the military conspiracy of the Dekabrists, which had been for several years in operation, broke out. Nicholas suppressed this revolt with great energy and personal courage; but the ultimate result was to arouse a policy of strong autocracy, based largely on the army, and bent on strictly maintaining internal peace. The civil administration was placed under military supervision; and the laws subsequently promulgated for the relief of serfdom were largely ineffective. Nicholas' foreign policy was aggressive. A war with Persia (1827-28) was concluded by a peace which gave Russia an important increase in territory; and a disastrous one with Turkey (1828-29) by the peace of Adrianople which secured to Russia the eastern coast of the Black Sea, and brought about the establishment of the Grecian kingdom. The European revolutions of 1830 were followed by an insurrection in Poland, which was rigorously suppressed and was followed by the complete Russification of that country. The unbending rule of Nicholas earned him the sobriquet of the "Iron Tsar." Under the stern discipline which he believed the necessities of the time and the expanding empire required, Russia seemingly became well-ordered. This was largely due to the work of the dreaded Third Section—the secret police system which he inaugurated, so as to bring every subject into direct communication with the throne. As opposed to the willing service of a free and enlightened people, encouraged to express their opinions on public questions, the servile subservience of an oppressed people always tends to degeneracy, and its effects became evident when the army and navy, called upon for special efforts, revealed astounding instances of corruption, disorganization and stupidity in administrative circles. Having, as he thought, disciplined Russia, Nicholas believed it to be his duty to discipline the world. In 1826, on behalf of the British government, politically and commercially interested in the development of Eastern Europe, the Duke of Wellington on a diplomatic mission had sought to effect a concert of opinion. The Iron Tsar had proved superior in diplomatic finesse to the Iron Duke and, without political safeguards, Great Britain had to submit to the encroaching Russification of Turkey by the Treaty of Adrianople. In 1849 Nicholas aided Austria in the conquest of the Hungarian revolutionists. His attitude toward Turkey brought on the Crimean War. In 1853 he demanded protectorate over Turkish subjects of Greek religion, but the Sultan refused, and was supported by England and France. The Russian army proved to be unprepared, and was defeated at the Alma and Inkerman. Nicholas died before the end of the contest (see CRIMEAN WAR). During his reign conformity to the Orthodox Greek Church was imposed on his subjects. He was the most prominent sovereign of his time and an honest, brave and majestic despot, but a martinet and

a reactionary who was always afraid to delegate his authority.

Consult Edwards, 'The Romanoffs' (1890); 'Lives' by Lacroix (1864-75) and Schmucker (1860); Shieman, 'Geschichte Russlands unter Kaiser Nikolaus I' (1904 et seq.); and 'Cambridge Modern History' (Vols. X and XI, 1907, 1909).

NICHOLAS II, Tsar of Russia: b. Saint Petersburg, 18 May 1868; executed by the Revolutionists, 17 July 1918. He was the eldest son of Alexander III by his wife, the Danish princess Dagmar, known as czarina by the name Maria Feodorovna. His education under General Danilovitch was military; it was concluded by a trip through the East, in 1891, during which he was nearly killed by a sabre stroke from a Japanese fanatic. His father's death 1 Nov. 1894 brought him (much against his will) to the throne; he married Princess Alice of Hesse, 26 Nov. 1894; and in May 1896 was crowned with great pomp at Saint Petersburg. His policy he proclaimed would be the peaceful one of his father, and this for 20 years certainly proved true as regards his relations with the European powers. His visits to Vienna, Breslau and Paris in 1896, and the visits paid him in return in 1897 by the Emperor of Austria, by William II of Germany, and by President Faure of France showed his willingness and the eagerness of Austria, Germany and France that there be a peaceful European policy. Even more striking was the Tsar's note to the powers, published by Count Muravieff 24 Aug. 1898, inviting them to a Peace Congress, looking to the disarmament of the Powers. The Hague Congress in 1899 was followed by another visit to Paris by the tsar 18-21 Sept. 1901 and by President Loubet's trip to Saint Petersburg 20-23 May 1902, and by a Franco-Russian convention intended to offset the Anglo-Japanese entente. The war with Japan and a reactionary policy at home gave rise to a strong revolutionary movement in 1905. Repression followed with relentless hand and Nicholas presented a miserable spectacle of vacillation—too weak to assert his autocratic powers and exact obedience and without the resolution or the humanity to inaugurate a liberal policy. His superstition was shown by his consultation of fortune-tellers, spiritualists, mystics and charlatans in his desire to secure a male heir, his first four children being all girls. His internal policy is dealt with fully in the article on Russia (q.v.). Upon his accession, Nicholas II was hailed as a liberal, if not a radical. Whether there was internal reform during his administration is uncertain; even the rescript in favor of religious freedom seemed a doubtful reform in the eyes of some critics, who urged that although freedom was granted to all present sects the death penalty still held for any Greek churchman who left the Orthodox faith for any other. How far the emperor was personally responsible for the acts of his government is also doubtful; he was often described as the mere tool of his narrow procurator-general, Pobiedonostyeff. The measures taken to Russianize Finland, and the slack treatment of those guilty of the Kishineff massacres, seem—to say the least—unlike the tsar as he was pictured at his accession. The part taken by Nicholas to prevent the outbreak of war in 1914 and his determination to

protect Serbia were perhaps the greatest and noblest acts of his public life. The story of his efforts in these directions is told elsewhere. (See RUSSIA; WAR, EUROPEAN). Reverses at the front and hints of pro-German intrigues brought troubles to the Tsar and his government in 1915 and 1916. The closing days of the latter year saw the resignation of Premier Stuermer brought about by the Duma. Trepoff succeeded and a more progressive administration ensued. Rasputin, the notorious monk, whose influence at court had been as powerful as it was baneful, was murdered. Trepoff's administration displeased the bureaucrats, however, and in January 1917 he was succeeded by Prince Golitzin, a reactionary Conservative and probably a pro-German. Discontent soon manifested itself under his régime. Riots provoked by food scarcity broke out in Petrograd on 9 March; within two days the infection had spread to the munition workers who voted to strike, and a mutiny followed in the army. The Duma met on 12 March, defied the Tsar's decree of dissolution and assumed the leadership of what everyone now recognized as a revolution. Nicholas was peremptorily told to dismiss his reactionary ministers and to inaugurate internal reforms if he would save his throne. The Duma leaders, under Rodzianko, also intimated that an end must be put to German intrigue and that the war be prosecuted with full vigor and in close co-operation with the Entente. Nicholas's weakness of resolution delayed matters until it was too late to save the Imperial House. On 15 March 1917 Nicholas II abdicated the throne at Pskov, for himself and his son, in favor of the Grand Duke Michael. The latter declined the then doubtful honor of the succession until a National Assembly should have passed upon the future form of government. The new government placed the Imperial family under arrest in the palace at Tsarkoe-Selo. After a few months' confinement there the former Tsar and his family were deported to Tobolsk, where about a year was spent in semi-seclusion amid the rigors of a Siberian winter. By orders of the Bolsheviki Nicholas II, now plain Nicholas Romanoff, was shot to death 17 July 1918, and a subsequent announcement was made that his wife and children had also been executed, but the exact fate of the family remains uncertain. Pope Benedict XV sent a special envoy to Russia to ascertain their fate and, if they were found alive, to bespeak decent treatment in their regard, but thus far his efforts have been futile. See RUSSIA; WAR, EUROPEAN, and consult Elchaninov, A., 'Czar Nicholas II' (London 1913); Gardiner, A. G., 'Prophets, Priests and Kings' (London 1908; new ed., 1914); Harden, Maximilian, 'Monarchs and Men' (Philadelphia 1913). Leudet, Maurice, 'Nicholas II in time' (Paris 1899); Oukhtomski, Prince E. E., 'Voyage en Orient, Grèce, Egypte, Inde, 1890-91, de son altesse impériale le Césarevitch' (2 vols., Paris 1893); Vasili, Paul, 'Behind the Veil of the Russian Court' (London 1914); 'Speeches of Nicholas, 1894-1906' (in Russian, Saint Petersburg 1906).

NICHOLAS, Sir Edward, English secretary of state: b. Wiltshire, England, 4 April 1593; d. East Horsley, Surrey, England, 1 Sept. 1669. He was educated partly at Queen's Col-

lege, Oxford, and in 1620-21, 1623-24, 1627-28 he was a member of Parliament. In 1641 he became secretary of state under Charles I, urged a composition with the Scots, arranged the Treaty of Uxbridge, after the surrender of Oxford (1646), retired to the Continent, but nominally remained in his office until the king's execution. During the exile of Charles II he was practically excluded from influence through the hostility of Queen Henrietta and the Catholic faction; but at the restoration in 1660 he resumed his former office from which he resigned in 1662.

NICHOLAS, George, American soldier and statesman: b. Hanover, Va., about 1755; d. Kentucky, in 1799. He was the son of Robert Carter Nicholas (1715-80), a prominent Virginia statesman. After graduation at William and Mary College in 1772 he joined the 2d Virginia Regiment in 1775, of which he was made captain. In November 1776 he became major of the 11th Virginia Regiment, of which he was made lieutenant-colonel in the following year. He resigned from the service in November 1778. In 1781 he was a member of the Virginia assembly, and in 1788 he was an active member of the convention that ratified the Federal Constitution. In 1790 he removed to Kentucky and was a member of the convention that formed the constitution of Kentucky at Danville, Ky., 1 April 1792. He was the first attorney-general of Kentucky.

NICHOLAS, Wilson Cary, American soldier and legislator: b. Hanover, Va., about 1757; d. Milton, Va., 10 Oct. 1820. In 1774 he was graduated from William and Mary College, and at the beginning of the Revolutionary War joined the Continental army. He became officer in command of Washington's life guards and served in this position till 1783. He was a member of the Virginia State Convention which ratified the Constitution of the United States, and was one of those who favored ratification. In 1799 he became United States senator, and in 1804 resigned from the senate to become collector of the ports of Norfolk and Portsmouth. In 1807 he was elected to Congress, serving till 1814, and in the latter year was elected governor of Virginia for two years. He was one of the most influential supporters of Thomas Jefferson.

NICHOLAS OF CLÉMANGES. See CLÉMANGES, MATHIEU NICOLAS.

NICHOLAS OF CUSA. See CUSA.

NICHOLAS LAND, an Arctic archipelago discovered in 1913 by Capt. Boris Andreevitch Vilkitsky (1870), Russian naval officer and Arctic explorer, who met with great success while commanding a squadron of ice-breakers in surveys of the ice-clad waters of the Siberian Ocean. Nicholas II Land, named for the last tsar of Russia, extends from 30 miles north of Cape Chelyuskin to 81° N. lat., 96° E. long. The eastern coasts of the newly discovered archipelago cover about 200 miles. The most southerly of the islands is within 30 miles of Asia. The geological specimens obtained indicate that Nicholas II Land is an extension of the continent of Asia. The explorer described Nicholas II Land as consisting of high abrupt cliffs, covered with scanty vegetation, and isolated peaks apparently volcanic.

NICHOLAS OF LYRA, li'ra, called "Doctor Planus et Utilis," mediæval French monk and biblical scholar: b. Lyre, Normandy; d. Paris, 23 Oct. 1340. He entered the Franciscan order in 1291, became professor of theology in the Sorbonne; later was provincial of his order in Burgundy and labored for the conversion of the Jews. His Hebraic and rabbinical learning was profound. His chief work is the 'Postillæ Perpetuæ' (1471-74), a running commentary on the Scriptures and the first put into print. It is liberal in its interpretations, but, on account of his linguistic knowledge, is on a much sounder basis than similar works of the period. It was much used by Luther. Consult Davidson, 'Sacred Hermeneutics' (1843).

NICHOLAS NICKLEBY, nik'l-bi, a well known novel by Charles Dickens which appeared serially in 1838 and 1839. It contains in Dotheboys Hall a realistic description of the condition of cheap boarding schools of that period, and the author's strictures accomplished not a little toward reform in this direction.

NICHOLASVILLE, nik'ō-las-vil, Ky., city, county seat of Jessamine County, on the Cincinnati, New Orleans and Texas Pacific, the Louisville and Nashville railroads; about 10 miles south by west of Lexington and 70 miles east by south of Louisville. It was settled in 1799, and in 1835 was incorporated. It is the commercial centre of a productive agricultural region, in which tobacco is one of the chief crops, and considerable attention is given to horse-breeding. It has flour and lumber mills, tobacco storage plants, and wheel works. The Jessamine Female Institute, opened in 1854, is located here, and there is a public library and a college for boys. Pop. 2,935.

NICHOLLS, nik'ōlz, Charlotte. See BRONTË, CHARLOTTE.

NICHOLLS, Francis Tillon, American lawyer: b. Donaldsonville, Ascension Parish, La., 20 Aug. 1834; d. 5 Jan. 1912. He was graduated from West Point in 1855, and in 1856 served in the campaign against the Seminole Indians. He then resigned his commission in the army to study law and was admitted to the bar in 1858, beginning his practice in Napoleonville. In 1861 he entered the Confederate army as captain and was promoted lieutenant-colonel in the same year and brigadier-general in 1862. He had charge of the defenses of Lynchburg, Va., and in 1864 was superintendent of the trans-Mississippi conscript bureau. After the war he resumed his law practice in Ascension Parish, La., and later removed to New Orleans (1880). In 1876 he was the Democratic candidate for governor; his party claimed the election by about 8,000 votes, but a Republican returning board declared his opponent elected. He, however, took his seat and was subsequently recognized as governor by the Federal government. In 1888 he was again elected governor and during his administration actively opposed the Louisiana Lottery Company, and vetoed the bill granting it a new charter with increased privileges. From 1893 to 1904 he was chief justice of the Louisiana State Supreme Court and thereafter until his death associate chief justice.

NICHOLLS, Rhoda Holmes, English-American painter: b. in Coventry, England (maiden name Grome). After receiving an

education in London, she became a pupil of the Bloomsbury School of Art in London and won there the queen's scholarship. She then studied in Rome under Cammerano and Vertunni. After being married to Burr H. Nicholls in Sussex in 1884 she came to the United States and eventually settled in New York City. Mrs. Nicholls has exhibited in all the artistic centres in the United States, besides Rome, Turin, Munich and London. She has taken medals in New York, Boston, Atlanta, Nashville and Charleston and in the West Indies and Interstate, Chicago, Buffalo and Saint Louis Expositions. She was on the staff of the *Art Interchange* and *Art Amateur*; and was co-editor of *Palette and Brush*. She is a member of the New York Water Color Club; the American Water Color Society; the American Society of Miniature Painters; the Art Students' League; the Woman's Art Association of Canada, and many other clubs and societies.

NICHOLS, Edward Leamington, American physicist: b. Leamington, England (of American parents), 14 Sept. 1854. After graduation at Cornell University in 1875, he studied in Leipzig, Berlin and Göttingen, taking his Ph.D. at the latter in 1879. He then was appointed fellow in physics at the Johns Hopkins and afterward spent some time in the Edison Laboratory at Menlo Park, N. J. From 1881 to 1883 he was professor of physics and chemistry in the Central University of Kentucky and in 1883 became professor of physics and astronomy in the University of Kansas. In 1887 he was made professor of physics at Cornell, which he has since held. He was president of the American Association for the Advancement of Science in 1907 and of the American Physical Society in 1907-08. He is also a member of the National Academy of Sciences; the Kansas Academy of Science; the American Institute of Electrical Engineers; the Illuminating Engineering Society, and was a member of the visiting committee of the United States Bureau of Standards. Dartmouth has given him the degree of Sc.D. and the University of Pennsylvania that of LL.D. Dr. Nichols was the founder of the *Physical Review*, which he edited from 1893 to 1912. He has published 'The Galvanometer' (1894); 'A Laboratory Manual of Physics and Applied Electricity' with Profs. Merritt, Bedell and others (2 vols., 1895); 'The Elements of Physics,' with Prof. W. S. Franklin (3 vols., 1896); 'Outlines of Physics' (1897), and many papers in scientific journals on experimental physics.

NICHOLS, Ernest Fox, American physicist: b. Leavenworth, Kan., 1 June 1869. After graduation at the Kansas Agricultural College in 1888, he studied in Cornell, Berlin and Cambridge, England. From 1892 to 1898 he was professor of physics at Colgate University and held the similar chair in Dartmouth in 1898-1903 and Columbia University in 1903-09. In 1909 he was made president of Dartmouth and held this post until 1916, when he became professor of physics at Yale. In 1907-09 he was a research associate of the Carnegie Institute of Washington, engaged in the study of radiation phenomena at the Mount Wilson Solar Observatory. Some of his important work is the remodeling and improvement of the Crookes radiometer; the study and measure-

ment of long heat waves; the measurement of the heat radiation from the stars Arcturus and Vega and the planets Jupiter and Saturn; and the measurement of pressure due to radiation. The American Academy of Arts and Sciences gave him the Rumford Medal in 1905. The degree of LL.D. has been given to him by several colleges and universities: Colgate, Clark, Wesleyan, University of Vermont, University of Pittsburgh and Dennison, and that of Sc.D. by Cornell (1897) and Dartmouth (1903). Dr. Nichols is a member of various scientific societies and in 1903 was vice-president of the American Society for the Advancement of Science. He has contributed many papers on radiation and kindred subjects to important scientific journals in this country and in Europe. He is a collaborator of the *Astrophysical Journal* and associate editor of the *Physical Review*.

NICHOLS, George Ward, American writer: b. Mount Desert, Me., 21 June 1837; d. Cincinnati, Ohio, 15 Sept. 1885. He was art critic on the New York *Evening Post* under William Cullen Bryant and was aide-de-camp to General Sherman in the Civil War. He was president of the Cincinnati College of Music for several years and greatly improved its educational and financial standing. He wrote 'The Story of a Great March' (1865); 'Art Education Applied to Industry' (1877); 'Pottery' (1878), etc.

NICHOLS, Henry Ezra, American naval officer: b. New York; d. off Paranaque, Philippine Islands, 10 June 1899. He was graduated from the United States Naval Academy in 1865 and served in the navy with steady promotion. He was engaged on the Coast Survey in 1876-77 and in 1880-84, and in 1897 took command of the *Bennington*, which became one of Admiral Dewey's fleet in 1898. In 1899 he was transferred to the command of the monitor *Monadnock* and rendered valuable assistance at the capture of Paranaque. Captain Nichols was overcome by the heat during the bombardment and died while his ship was still in action.

NICHOLS, Henry Hobart, jr., American landscape painter: b. Washington, D. C., 1 May 1869. He received his education in the public schools of Washington and Shortledge College, Pennsylvania, and studied at the Art Students' League of Washington at Julien's Academy in Paris. In Paris he also studied under Castelucho. He was the founder of the Society of Washington Artists and was assistant to the director of Fine Arts of the United States Commission to the Paris Exposition in 1900. In 1912 he was elected an associate of the National Academy of Design. He is a regular contributor to the Corcoran Art Gallery's exhibitions and has received several prizes there. He is a member of the Allied Artists of America; of the New York Water Color Club; of the American Water Color Society, and many other clubs and societies. He now lives at Lawrence Park, Bronxville, N. Y.

NICHOLS, William Ford, American Protestant Episcopal bishop: b. Lloyd, N. Y., 9 June 1849; d. 5 June 1924. He was graduated from Trinity College, Hartford, Conn., in 1870 and from the Berkeley Divinity School in 1873. He entered the priesthood the next year and was successively rector of churches at West Hartford, Conn.; Newton, Conn.; Christ

Church, Hartford (1877-87); and Saint James, Philadelphia (1887-90). He declined the bishop-coadjutorship of Ohio in 1888, but in 1890 was consecrated bishop-coadjutor of California, becoming bishop of that diocese in 1893. In 1893 he founded the Christian Divinity School of the Pacific at San Mateo, Cal. He was a delegate to several conferences of his church in the United States and abroad and wrote 'On the Trial of Your Faith' (1895); 'A Father's Story of the Earthquake and Fire of 1906' (1906); 'Apt and Meet Counsels to Candidates for Holy Orders' (1909); 'Some World Circuit Saunterings' (1913), etc.

NICHOLS, William Henry, American manufacturing chemist: b. Brooklyn, N. Y., 9 Jan. 1852. He was educated in the Polytechnic Institute of Brooklyn and was graduated from the New York University in 1870, since when he has been engaged as manufacturing chemist, copper-refiner and smelter. In 1890 he became president of the Nichols Copper Company and has been associated with a number of other corporations. He was president of the Granby Consolidated Mining, Smelting and Powder Company and an incorporator of the American Chemical Society. In 1904-05 he was president of the Society of Chemical Industry and in 1912 of the International Congress of Applied Chemistry. He was also made chairman of the committee on chemicals of the Council of National Defense in April 1917.

NICHOLSON, nīk'ol-sōn, Sir Francis, English colonial governor: b. England, 1660; d. London, 5 March 1728. In 1684 he came to America as lieutenant in the English army and in 1688 was commissioned lieutenant-governor of the New England colonies and represented the governor, Sir Edmund Andros (q.v.) at New York. At the time of the accession of William and Mary in England and of the Leisler rebellion in New York, he was obliged to abdicate his office and return to England. (See LEISLER, JACOB). In 1690 he was appointed lieutenant-governor of Virginia and went to Jamestown to take charge of the affairs of the colony. During his administration, which was most successful, he gave especial attention to bettering the condition of the Established Church and to education; he was one of the founders of William and Mary College, to which he gave £300. When Andros succeeded Lord Howard as governor of Virginia, Nicholson, disappointed that he had not received the appointment, resigned as lieutenant-governor and was made governor of Maryland. Here he aroused opposition by changing the capital from Saint Mary's to Annapolis and also by his intolerant attitude toward the Catholics and others not connected with the Church of England. In 1698 he was appointed governor of Virginia, but failed to attain his former success in that colony. His constant menacing and tyrannical attitude aroused the opposition of the Virginians and he particularly angered them by his removal of the capital from Jamestown to Williamsburg; he was recalled from Virginia in 1705. In 1709 and 1711 he was in command of abortive expeditions against New France. In 1710 he commanded an expedition against Acadia and captured Port Royal and in 1712 was made governor of Acadia. In 1719 he received his appoint-

ment as governor of South Carolina, being the first royal governor of that colony and filled the office with ability and success. He was knighted in 1720 and returned to England in 1725, when he was promoted lieutenant-general. He wrote 'Journal of an Expedition for the Reduction of Port Royal' (1711), reprinted in the Nova Scotia Historical Society's 'Transactions' for 1879, and 'An Apology or Vindication of Sir Francis Nicholson, governor of South Carolina' (1724).

NICHOLSON, Henry Alleyne, English scientist: b. Penrith, Cumberland, 11 Sept. 1844; d. Aberdeen, Scotland, 19 Jan. 1899. He was educated at Göttingen and Edinburgh, was professor of natural history in the University of Toronto in 1871-74, of physical science in the Durham College of Physical Science in 1874-75 and of natural history at Saint Andrews in 1875-82. From 1882 to 1899 he was regius professor of natural history at Aberdeen. His chief work was done in the palæontological department of zoology. Among his writings are 'A Manual of Palæontology' (1872; 3d ed. with Lydekker 1889), 'Introduction to the Study of Biology' (1872); 'The Ancient Life History of the Earth' (1877); 'Synopsis of Classification of the Animal Kingdom' (1882), and many scientific papers.

NICHOLSON, Henry Hudson, American engineer: b. Rushford, Wis., 25 May 1850. He was educated at Antioch College, Ohio, and in 1865 served as a private in the 49th Wisconsin Infantry. In 1874-82 he was professor of science in the State Normal School, Peru, Neb., and from 1882 to 1905 professor of chemistry and director of the chemical laboratory in the University of Nebraska. In 1884 he studied at Harvard and in 1885 at Heidelberg and Berlin. He was consulting engineer of the Hamilton Mines Company, 1898-1903; Ingold Placer Mining Company, Jack Gold Mines Company, Oregon, and manager and engineer of the Standard Consolidated Mines Company; directing engineer of the Killen, Warner-Steward Company, Chicago; consulting engineer of the Killen-McLaughlin Mining Company, Red Cliff, Colorado, and of the Plumas Lincoln Copper Company, Doyle, Cal. He is a member and fellow of various societies and the author of several papers on his specialty.

NICHOLSON, Isaac Lea, American Protestant Episcopal bishop: b. Baltimore, Md., 18 Jan. 1844; d. Milwaukee, Wis., 9 Oct. 1906. He was graduated from Dartmouth in 1869, took priest's orders in the Episcopal Church in 1872 and held rectorships at Baltimore 1872-75; Westminster, Md., 1875-79, and Saint Mark's, Philadelphia, 1879-91. In 1891 he was consecrated bishop of Milwaukee.

NICHOLSON, James, American naval officer: b. Chestertown, Md., 1737; d. New York city, 2 Sept. 1804. He went to sea when a boy, and was engaged in the capture of Havana in 1762. In 1776 he was given command of the *Defence*, fitted out by the colony of Maryland, and retook some vessels which the British had captured. In June 1776 he was assigned to the command of the *Virginia* of the Continental navy, and while his vessel was

blockaded in Chesapeake Bay he with his crew joined the army and took part in the battle of Trenton. Later when the *Virginia* attempted to put to sea she went aground and was taken by the British, though Captain Nicholson and most of his crew escaped; an official inquiry acquitted him of all blame. In January 1777 he was made commander-in-chief of the Continental navy, holding that position till the close of the war. In June 1780, when in command of the frigate *Trumbull*, he fought a severe battle with the British ship *Wyatt*, without decisive result, and in August 1781 was taken prisoner in the *Trumbull* by the British vessels *Iris* and *General Monk*, though he made a most gallant resistance and did not surrender until his ship was completely disabled. He was exchanged shortly before the close of the war, and in 1801 was appointed commissioner of loans for the State of New York.

NICHOLSON, James William Augustus, American naval officer: b. Dedham, Mass., 10 March 1821; d. New York, 28 Oct. 1887. He entered the navy as a midshipman in 1838, served in the Mexican War and as lieutenant under Perry on the Japan expedition. In the Civil War he commanded the steamer *Isaac Smith* in the operations against Port Royal (1861); in 1862 was promoted to the rank of commander and had charge of the monitor *Manhattan* in the battle of Mobile Bay; and later took part in the bombardment of Fort Morgan. In 1873 he was promoted commodore, and from 1876 to 1880 was in command of the Brooklyn Navy Yard. In 1881 he was made rear-admiral and was assigned to the Mediterranean, where he protected the United States consulate during the English bombardment of Alexandria, Egypt, and had much influence in restoring order. In 1883 he was retired from active service with the rank of rear-admiral.

NICHOLSON, John, British officer in India: b. Dublin, 11 Dec. 1821; d. near Delhi, 23 Sept. 1857. He went to India in 1839 as a subaltern in the service of the East India Company; displayed great bravery in the defense of Ghazni in 1841 and during the treacherous attack made by the Afghans immediately afterward. He served in the commissariat during the campaign in the Satlej and was present at Ferozshah, and in 1846-47 was in Kashmir. While deputy commissioner in the district of the Punjab between the Jhelam and the Indus his tact and skill and prodigious valor in reducing the savage tribesmen to law and order was something marvelous, so much so that in his last year no murder or highway robbery was ever committed or even attempted; the impress of his commanding personality was such that he was worshipped by a sect of fakirs as a demigod under the name of Nikkel Seyn. He distinguished himself in the Second Sikh War (1849) at Gujrat and Chilianwallah. He served as administrative officer at Bannu 1851-56. On the outbreak of the Indian mutiny he was made brigadier-general. During that trying period he did more than any other man to maintain British authority in the Punjab; strove to put mettle into his over-cautious chief, General Wilson, and organized a flying column which signally defeated the mutineers at Trimmu Ghaut and at the Ravi River. He led

the assault on Delhi, at which he was mortally wounded, and died nine days afterward. Of commanding stature and a born soldier and administrator, his early death removed a tower of strength to British rule in India. Consult the 'Life' by J. L. Trotter (1904), and Sir John Kaye, 'Lives of Indian Officers' (1889).

NICHOLSON, Joseph Shield, English political economist: b. Wrawby, Lincolnshire, 9 Nov. 1850. He was educated at the University of Edinburgh, at Trinity College, Cambridge, and at Heidelberg, and in 1880 became professor of political economy at Edinburgh. Among his writings on his specialty are 'Effects of Machinery on Wages' (1878); 'The Silver Question' (1886); 'Principles of Political Economy' (1893-1901); 'Strikes and Social Problems' (1896); 'Banker's Money' (1902); 'Elements of Political Economy' (1903); 'The Tariff Question' (1903); 'History of the English Corn Laws' (1904); 'Rates and Taxes as affecting Agriculture' (1905); 'A Project of Empire' (1909); 'The Neutrality of the United States' (1915). He has also published some fiction, including 'Thoth' (1888); 'Toxar' (1890); edited (1884) Adam Smith's 'Wealth of Nations,' and written two volumes on 'Ariosto.'

NICHOLSON, Louisa Margaret (LOUISE NIKITA). American singer: b. Philadelphia, Pa., 1872. She was educated abroad, where she made her debut in 1889 with marked success, and became prima donna at the Paris Opera in 1894. The rôles in which she has achieved most success are 'Fille du régiment'; 'Traviata'; 'Pagliacci,' etc.

NICHOLSON, Meredith, American author: b. Crawfordsville, Ind., 9 Dec. 1866. He entered journalism and in 1885-97 was reporter and editor on the Indianapolis *News*. In 1897-1901 he was treasurer of a coal-mining company in Denver and then returned to Indianapolis, where he has since devoted himself to literature. He is a member of the National Institute of Arts and Letters and has received honorary degrees from Wabash and Butler colleges. He has written 'Short Flights,' verse (1891); 'The Main Chance' (1903); 'The Hoosiers' (1900); 'Zella Dameron' (1904); 'The House of a Thousand Candles' (1905); 'Poems' (1906); 'The Port of Missing Men' (1907); 'Rosalind at Red Gate' (1907); 'The Little Brown Jug at Kildare' (1908); 'The Lords of High Decision' (1909); 'The Siege of the Seven Suitors' (1910); 'A Hoosier Chronicle' (1912); 'Provincial America,' essays (1913); 'Otherwise Phyllis' (1913); 'The Poet' (1914); 'The Valley of Democracy' (1918).

NICHOLSON, Reynold Alleyne, English Orientalist: b. 19 Aug. 1868. He was a son of H. A. Nicholson (q.v.). He was educated at the University of Aberdeen and at Trinity College, Cambridge, continuing his studies in Germany. He was examiner in classics at Aberdeen in 1897 and since 1901 has been professor of Persian in University College, London, and lecturer in Persian at the University of Cambridge. He has published 'Selected Poems from the Divani Shamsi Tabriz' (1898); 'Memoirs of the Saints' (Persian text, 1905-07); 'Literary History of the Arabs' (with

Du Pre Thornton, 1907); 'Introduction and Notes to Fitzgerald's Omar Khayyam' (1909); 'The Don and the Dervish' (1911); 'The Mystics of Islam' (1914); three Arabic reading-books, etc.

NICHOLSON, Thomas, American bishop and educator: b. Woodburn, Ontario, 27 Jan. 1862. He was graduated from the Toronto Normal School in 1883 and entered the Methodist Episcopal ministry in 1884, after having taught in various schools. After holding charges in Michigan he became professor of philosophy and biblical literature and also principal of the academy at Cornell College, Iowa. From 1903 to 1908 he was professor of philosophy in Dakota Wesleyan University, of which he was also president. In 1908 the General Conference elected him secretary of the board of education of the churches, and he took a leading part in the educational development of Iowa and South Dakota. In 1916 he was elected bishop of the Methodist Episcopal church. He has lectured in many States on the English Bible. Several universities have given him the degrees of D.D., LL.D., A.B. and A.M. In 1898 he was president of the South Dakota State Teachers' Association. Bishop Nicholson is the author of 'Epworth League Bible Studies' (1901-02); 'Epworth League Devotional Topic Book' (1902); 'The Necessity of the Christian College' (1904), and 'Studies in Christian Experience' (1907). Since 1908 he has been editor of *The Christian Student* (Chicago).

NICHOLSON, William, English scientist: b. London, England, 1753; d. London, 21 May 1815. After making two voyages as a midshipman in the East India service (1769-76) he entered an attorney's office, but soon was sent to Amsterdam as agent for the sale of Wedgwood pottery. In 1784 he was appointed secretary to the General Chamber of Manufacturers of Great Britain and he was also connected with the Society for the Encouragement of Naval Architecture, established in 1791. He spent much time upon the construction of various machines for comb-cutting, file-making, cylinder printing, etc., and he invented an aerometer. In 1800 he gave a course of public lectures in London on natural philosophy and chemistry and about this time he discovered a way to bring about the decomposition of water by the voltaic current. During the later part of his life he was chiefly interested in waterworks engineering in Portsmouth, Gosport and Southwark.

In 1797 he founded the *Journal of Natural Philosophy, Chemistry and the Arts*, generally known as *Nicholson's Journal*, the earliest journal of its kind in Great Britain. This was continued until 1814. Nicholson attracted attention to himself by the publication of 'An Introduction to Natural Philosophy' (London 1781). This was followed by a translation of Voltaire's 'Elements of the Newtonian Philosophy.' Besides many contributions to the *Philosophical Transactions*, he published 'First Principles of Chemistry' (1788); a 'Chemical Dictionary' (1795); edited the 'British Encyclopædia, or Dictionary of Arts and Sciences' (6 vols., London 1809), and translated Fourcroy's 'Chemistry' (1787) and Chaptal's 'Chemistry' (1788).

NICHOLSON, William, English painter and engraver; b. Newark-on-Trent, 1872. He began his artistic education under Her-Romer in London and completed it under Bougereau and Constant in Paris. He collaborated with James Prydein the designing of posters, the brilliant originality of which at once attracted attention and established his reputation as a great wood engraver. Among his productions some of the more notable are 'An Alphabet' (1898); 'An Almanac of Twelve Sports' (1898); 'London Types'; 'Characters of Romance' (1900). His portrait woodcuts have met with wide acceptance, especially his 'Whistler,' 'Kipling,' 'Bernhardt,' 'Queen Victoria.' His portraits in oil include 'The Landlord,' a remarkably telling and vivid piece of work; 'The Little Baron'; 'Master Francis and Christopher Bacon'; 'Nancy with the Mug'; 'Nancy with the Feather Hat,' and those of his mother and W. E. Henley. 'Carlina,' an exquisite study in the nude; 'The First Communion Day,' and the 'Place du Petit Enfer' are examples of his work in other fields. His work is marked by originality, excellent draughtmanship, exquisite coloring and a genuine instinct for style. He was awarded a gold medal at the Paris exhibition of 1900.

NICHOLSON, William Gustavus, FIELD-MARSHAL LORD, British soldier; b. Leeds, 2 March 1845; d. London, 13 Sept. 1918. He passed through Woolwich in 1863 and obtained his first commission in the Royal Engineers. From 1868 to 1871 he served in the West Indies; in the latter year he was sent to India, where he spent about 30 years, being engaged most of the time on government engineering works. After serving in the Afghan War he became secretary of the defense committee at Simla, and later went through the Egyptian campaign in 1882. In 1890 he was made military secretary to Lord Roberts, then commander-in-chief in India. Between intervals of frontier fighting Nicholson constructed fortifications, roads and railways. When Lord Roberts took over the chief command in the South African War he called Kitchener from the Sudan and Nicholson from India to assist him. The latter returned to India at the end of 1900 with the rank of major-general. Early in 1901 he was appointed director-general of mobilization and military intelligence at the War Office, London, where he carried into effect a general reorganization in the face of powerful opposition. He served a year as chief military attaché to the Japanese army in Manchuria 1904-05, and in the latter year was offered a Mediterranean command, which he refused. In 1908 he was promoted chief of the general staff, in which post he was succeeded by General French in 1912. He continued to be a member of the Committee of Imperial Defense and during the war served as a commissioner to inquire into the conduct of the Gallipoli and Mesopotamian campaigns. Nicholson's brilliant career was remarkable in that he never commanded even a small unit in peace or war, yet he rose to field-marshal; he never graduated from the Staff College and yet became chief of the Imperial General Staff. Without political, family or other influence he became a peer of the realm and occupied a position of recognized authority among statesmen and soldiers.

VOL. 20 — 21

NICHOLSONITE, a variety of the mineral aragonite, containing from 1 to 10 per cent of zinc. Occurs at Leadville, Colo.

NICIAS, nish'i-as, Greek painter of the 4th century B.C. He was renowned for the loveliness of his woman figures in encaustic. He was a contemporary to Apelles, the painter of Alexander the Great, and Praxiteles the sculptor, whom he assisted in coloring his statues. He is said to have invented encaustic painting.

NICIAS, Athenian general in the Peloponnesian War (q.v.): d. Sicily, 414 B.C. He inherited great wealth (including over 1,000 slaves) from his father, Niceratus, and, entering politics after Pericles' death, became leader of the aristocratic party and the enemy of all demagogues, notably Cleon. He won popular favor, however, by his piety and the lavish use of his wealth. His natural caution and timidity was a proverb among the comic poets of the day, and he seems to have been the prey of blackmailers. In 425 he led the troops that hemmed the Spartans in at Sphacteria; in the next year captured Cythera; in 423 was in command in Thrace; and, after Cleon's death, brought about the famous Peace of Nicias (421), which ended the first period of the Peloponnesian War. Cleon's place as a leader of the war party was to a certain degree taken by Alcibiades, who won consent to his plan for the Sicilian expedition by astutely suggesting that Nicias, the opponent of the project, the tried general and the well-known conservative, should be one of the commanders of the expedition. The recall of Alcibiades soon after the expedition started left matters largely in Nicias' hands. After the death of his colleague Lamachus (415) this was less true, since the new general Demosthenes boldly urged open attack on Syracuse. Nicias saw that this would be fatal, and, it is said, that, influenced by superstitious fear of an eclipse of the moon, refused to act at all for a month. He was terribly defeated and weakly surrendered; and in spite of the promises of his enemies was put to death. He had been mortally sick throughout this trying campaign. Consult Church, 'Nicias and the Sicilian Expedition' (1899).

NICK OF THE WOODS, a romance by Robert Montgomery Bird, M.D., published in 1837. It is a tale of Kentucky during the "dark and bloody" days, and was very popular about the middle of the 19th century. A play, founded upon this narrative, was received with boundless applause, held the stage (a certain grade of stage) for many years, and was a forerunner of the "dime novel" in stimulating a desire among boys to run away from home and go West to kill Indians.

NICKEL, a metallic element resembling iron in its appearance and general properties, discovered by Cronstedt in 1751 in kupfernickel (see NICCOLITE), a mineral which resembles copper ore, but from which copper cannot be extracted and whose name appears to signify "devil's copper." Metallic nickel occurs in the form of grains along the bed of the Fraser River, and it is also a common constituent of meteorites. The commercial supply, however, is obtained by the reduction of certain nickel-bearing minerals, of which niccolite and garnierite are important. The latter mineral is

especially valuable because it is free from cobalt, a metal with which nickel is almost always associated, and from which it can be separated only with much difficulty. Garnierite is a hydrated silicate of nickel and magnesium, of variable composition, which occurs in vast quantities in the vicinity of Noumea, New Caledonia; similar deposits also exist in Douglas County, Ore., and Jackson County, N. C., and also in the province of Malaga, Spain. The New Caledonia mines are worked by a French company, which ships the nickel to Europe both as matte and as ore. Nickel also occurs as a subordinate constituent of the mineral pyrrhotite (Fe_3S_4) replacing the iron up to 6 per cent. In the Sudbury district of Ontario, the largest producer of nickel in the world, the chief ore is pyrrhotite occurring as a magmatic segregation (q.v.) in a great gabbro (q.v.) (norite) sill (q.v.). Little nickel is produced in the United States.

Physically, nickel is a hard, ductile, malleable metal, white in color, but with a yellowish tinge, and susceptible of a fine polish. Its specific gravity varies from 8.36 to 9.26, according to the physical treatment to which the metal has been subjected; its specific heat is about 0.109 and its specific electrical resistance is about one-seventh of that of mercury. It melts at a high temperature,—probably at about 2,500° F. Next to iron and cobalt, nickel is the most magnetic substance known, the magnet attracting it very strongly, though less strongly than either of the other two metals mentioned. (For full data concerning the magnetic qualities of nickel, consult Ewing, 'Magnetic Induction in Iron and Other Metals'). Nickel is greatly used for electroplating, both for protection against rusting and on account of the lustrous polish that can easily be given to articles coated with it. It is also largely coming into favor for the manufacture of cooking utensils. When alloyed with other metals nickel is used for coinage and for other purposes past enumeration. With iron it forms alloys that are collectively known as "nickel-steel," certain of these being of the highest value for the manufacture of armor plate. The nickel-iron alloys are anomalous in many respects. It has been found, for example, that although nickel and iron are two of the most highly magnetic elements known, it is possible to form alloys of these two metals alone, which are practically non-magnetic. Iron-nickel alloys are also anomalous with respect to their coefficients of expansion, and one of them in particular (known as "invar") has a coefficient of expansion which is almost inappreciable, although iron and nickel, separately, have coefficients of considerable magnitude. Chemically nickel is a dyad. It has the chemical symbol Ni, and an atomic weight of 58.7 if $\text{O}=16$, or of 58.3 if $\text{H}=1$. Its most important oxides are the monoxid, NiO , and the sesquioxid, Ni_2O_3 . The metal itself does not oxidize in air at ordinary temperatures, but only when strongly heated in contact with air or with steam. The monoxid, NiO , may be prepared by the direct oxidation of the metal at a high temperature in an atmosphere of steam, or by precipitating a solution of a nickel salt with caustic potash, and then heating the green nickel hydrate, $\text{Ni}(\text{OH})_2$, which is thrown down. The monoxid is a green powder, which be-

comes yellow when heated, and from it the various nickel salts may be prepared. The sesquioxid, Ni_2O_3 , is a black substance, and is most conveniently prepared by adding a solution of bleaching powder to a soluble nickel salt. Nickel bromide, NiBr_2 , nickel chloride, NiCl_2 , and nickel sulphate, $\text{NiSO}_4 + 7\text{H}_2\text{O}$, are used in medicine to a limited extent. Sulphuretted hydrogen gas precipitates nickel from alkaline solutions in the form of a black sulphide, having the formula NiS . (See CHEMICAL ANALYSIS). Finely divided nickel absorbs dry carbon monoxid at 85° F., with the formation of a singular compound called "nickel carbon monoxid," having the formula $\text{Ni}(\text{CO})_4$. This substance is a volatile liquid which freezes at 13° F. below zero, and boils at 109° F. Its vapor explodes violently when heated to 140° F., and deposits pure nickel when mixed with an inert gas and passed through a heated tube. Advantage is taken of this strange compound for the preparation of metallic nickel for chemical purposes, when great purity is essential. See ORE DEPOSITS.

NICKEL, Refining of. See ELECTRO-CHEMICAL INDUSTRIES.

NICKEL GLANCE, a name given to two nickel ores (NiAsS , NiSbS), now fallen practically into disuse and formerly applied to Gersdorffite.

NICKEL-STEEL. Following the hint offered by iron and nickel alloys in meteorites, experiments in making nickel-iron and nickel-steel began 80 years ago when Faraday and Stodart alloyed nickel and iron (1822). Further experiments, to mention only a few names, were made by Wolf in Schweinfurt (1830), by Bessemer (1858) and by John Garugee of Connecticut (1883). The first systematic and practical tests of the value of nickel-steel were made by James Riley of Glasgow in 1888-89. The experiments of C. E. Guillaume of the International Bureau of Standards reported in 1899 showed that in addition to its previously known characteristics, the most notable of which were resistance to corrosion much greater than that of carbon steel and the remarkable combination of high resistance to stresses and shocks, retaining its fibrous structure where carbon steel crumbles, with great malleability and ease of working. For forgings, however, it has been found necessary to have manganese present in the proportion of from 0.3 to 0.7 per cent. Nickel-steel, if containing more than 36 per cent of nickel, has the lowest coefficient of expansion known, remaining almost invariable in dimensions under the ordinary atmospheric changes of temperature. A combination of this steel with about one-half of one per cent each of manganese, silicon and chromium constitutes the alloy Invar (q.v.) an invaluable material for instruments of precision. Much more widespread, of course, is the use of nickel-steel and nickel-chrome steel for armor plate adopted because of its unequalled hardness and toughness and because its loss of strength from punching is only 15 to 20 per cent of the original strength, whereas carbon-steel loses about 33 per cent when punched. A more important use, though apparently limited by the expense of nickel-steel, is for rails; a test made by the Pennsylvania Railroad on the Horseshoe Curve resulted so favorably that the rails on much traveled

curves are nearly all of nickel-steel even where the straight away tracks are of carbon-steel. For ordinary uses only a very small percentage of nickel is required, the range being from 1.5 to 4 per cent. Nickel-steels may now be had in the market with from 1.5 to 95 per cent of nickel. It is in use for gun tubes and other ordnance parts, pneumatic hammers, drills, blades of turbines, gas engine valves, aero-engine parts, axles, shafts and gears and all parts of machines which have to sustain severe strains and shocks. A chrome-nickel steel carrying 0.45 per cent carbon; 0.51 per cent manganese; 1.19 per cent nickel, and 0.98 per cent chromium, shows a tensile strength of 224,250 pounds per square inch. It is much used in aeroplane construction. The mechanical properties of nickel steels, however, are not wholly dependent upon their content of nickel, but they are modified to a considerable degree by the percentages of carbon and manganese in the alloy. The increase of carbon in 30 per cent nickel-steel from 0.12 per cent up to 0.80 per cent exhibited an increase of tensile strength from 64,000 pounds to 114,000 pounds per square inch; the elastic limit at the same time being increased from 41,000 to 68,000 pounds per square inch. The elongation was increased from 29.5 per cent to 32.5 per cent and the reduction of area from 63.9 per cent to 50 per cent. The addition of very small percentages of chromium to nickel-steels increases very considerably their resistance to wear.

Platinite.—The nickel-steel containing 46 per cent of nickel and about 0.15 per cent of carbon has been given the name "platinite," because, having almost exactly the same expansibility under heat as the glass used in making incandescent electric light bulbs, it may, therefore, be used successfully as a substitute for platinum for the sealed-in wires. It is also of great value in making mountings for telescope, microscope and other optical lenses.

The alloys with larger proportions of nickel (above 36 per cent) not only have a surprisingly low coefficient of expansion, but differ from the alloys with less nickel in respect to magnetism; alloys with less than 25 per cent of nickel can be made non-magnetic or magnetic to any desired degree; between 25 and 35 per cent the alloys are practically non-magnetizable at ordinary temperatures, but on being cooled to 32° exhibit magnetic qualities, and after being cooled to 60° below zero, become highly magnetizable, a property not lost until it has again been heated to 1080°. Consult United States Standards Bureau Circular 58, 'Invar and Related Nickel-Steels' (Washington 1916).

NICKER, in *Teutonic mythology*, water-fairies which dwell in rivers and lakes as well as in the sea. Mention is made of them in the poem of 'Beowulf.' The word seems originally to have been used as an indefinite name for any water-monster. Traces of it may be found in 'Old Nick,' nix, and nixy (borrowed from German *Nixe*).

NICKNAMES, **National and Popular.** The little name called nickname is a familiar substitute for the proper name of a person or place, given either in ridicule or affection. In the English language "neke name" or "eke name," appears as early as 1440. Possibly the

name came from nick, to cut; for the nickname is primarily a cutting of the full name, such as Ned for Edward, Bess for Elizabeth, Nick for Nicholas, etc. Nicknames sometimes develop into graphic individualities and create a national type or figure, which the pencils of artists and caricaturists elaborate until Uncle Sam, or John Bull, or the poilu, or the Yank, or the doughboy come to represent the character and feeling of an entire nation or an entire class.

UNCLE SAM.—First on the list comes the famous "Uncle Sam." The story of the origin is as follows: In the year 1812 a Mr. Samuel Wilson, invariably called Uncle Sam by kindred and friends, was an inspector appointed by the government to receive large supplies for the army contracted for in New York and to be delivered at Troy on the Hudson. The casks and chests were all marked with the initials of the contractor Elbert Anderson (E. A.), above and beneath those of the country United States (U. S.). A facetious workman, being asked the meaning of the latter, replied in jest "he did not know unless they meant Elbert Anderson and Uncle Sam. The jest took, was repeated by other workmen and by them carried into the army. The initials on the commissary's barrels and boxes were carried throughout the country and the explanation soon gained wide renown. "Uncle Sam" became the representative of the United States government and the national figure.

BROTHER JONATHAN.—Older than Uncle Sam is Brother Jonathan, the popular representative of the people of the United States. The original was Jonathan Trumbull (q.v.), governor of Connecticut, noted for his common sense and integrity. He was a native of Lebanon, Conn., a graduate of Harvard and a member of the Connecticut assembly. He did everything in his power to secure the independence of the colonies and was implicitly trusted and consulted by Washington in emergencies. When Washington was in need of ammunition and the officers whom he called into consultation could offer no suggestions, Washington said, "We must refer the matter to Brother Jonathan," alluding to Trumbull, who from that day was known as Brother Jonathan. In due time the name was applied to the whole nation. Trumbull looked like the familiar symbolic caricature. He was tall, gaunt, sharp-featured and for full dress wore a swallow-tailed homespun coat made in his own household from wool of his own sheep and colored with maple-bark procured from his own trees. His tight trousers, six inches above his ankles, were of striped linsey-woolsey, spun and made by his own family.

JOHN BULL.—John Bull was used in a satire of Dr. John Arbuthnot called "Law is a Bottomless Pit," exemplified in the case of Lord Strutt, John Bull, Nicholas Frog and Lewis Baboon (Louis XIV), who spent all they had in a lawsuit. This was a series of five pamphlets advocating the conclusion of peace after the Wars of the Spanish Succession in the days of Queen Anne. The five tracts are printed in two parts as the History of John Bull in 'Miscellanies in Prose and Verse' (1727) with preface by Pope and Swift, intimate friends of Dr. Arbuthnot. Arbuthnot fixed the popular

conception of John Bull, although it is not certain that he originated the character. The lively satire is still amusing reading. Arbuthnot says: "Bull in the main was an honest, plain-dealing fellow, choleric, bold and of a very inconstant temper. Mrs. Bull was Queen Anne, John Bull's mother was the Church of England and John Bull's "Sister Peg," the Scotch, was a poor girl who had been reared on oatmeal and water and lodged in a garret exposed to the north wind. This had given her a hearty constitution. Peg would faint at the sound of an organ yet would dance and frisk at the noise of a bagpipe. "Peg was in love with John Calvin."

JACQUES BONHOMME.— Jacques Bonhomme is a name given to the French. It originated in mediæval times and was applied to the poor peasant, who, with extraordinary patience, first paid for the costly banners and suits of armor that were captured from the noblemen at Crécy and Poitiers and then paid their lord's ransom and after that again helped with their hard won earnings to swell his revenues. So tractable and meek were they that a nobleman who had wasted all his substance used to comfort his creditors with the observation that "Jacques Bonhomme" would pay all of his debts. But when the peasants awoke and rose in madness against their oppressors "Jacques Bonhomme," the good-natured peasant, went out of fashion for a time.

JEAN CRAPAUD ("toad") dates from the time the French kings had three toads in their coat-of-arms. Paris was called Lutetia the muddy, and the inhabitants were called Frogs. The Frenchman is often referred to as "Johnny Crapaud."

Nicknames of Various Nationalities.— **BLACKAMOR**, a negro in contra-distinction to a tawny Moor; **BLUE CAPS**, or **BLUE BONNETS**, name for Scotchmen; **BLUE NOSE**, name for Nova Scotians; **BOG TROTTER**, name for an Irishman; **BONNET ROUGE**, a French Red Republican, in allusion to the red cap of Liberty; **CABBAGE EATER** (*Kapustak*), a Russian; **CARLO**, an Italian; **CANUCK**, a Canadian; **CHUKHUA**, Russian name for a Finn; **COCKNEY**, a London citizen born within the sound of Bow Bells; **CHOW**, a Chinaman; **COON**, a negro; **COLIN TAMPON**, a Swiss; **CROATIC**, an Italian name for an Austrian; **COUSIN MICHAEL**, a German; **CUFFEY**, a negro (also written **CUDDY**), meaning a beast of burden (*FRIDAY*, child in *Ashantee*); **DAGO**, from Saint Jago or San Diego, an Italian laborer; **FROG-EATER**, a Frenchman, in allusion to his fondness for frogs; **GREASER**, name applied to a Mexican by the people of the United States on account of his greasy appearance; **INFIDEL**, a Turk; **HANS WORST** (*Jack Sausage*), a German; **IVAN IVANOVITCH**, a Russian, the embodiment of the Russian people; **JACK PUDDING**, an English clownish fellow; **JACQUES**, a poor French artisan; **JEAN DE LA SUIE**, a Savoyard; **JEAN POTAGE**, a Frenchman; **JEAN BAPTISTE**, a Canadian; **JOHN CHINAMAN**, a Chinaman; **JOHNNY ROW**, an English rustic, or country bumpkin; **MACARONI**, an Italian; **MOSKEL**, a native of Southern Russia; **MYNHEER CLOSH** (or **CLAUS**), a Dutchman; **MOSOO**, a Frenchman; **NIC FROG**, a Dutchman; **PADDY**, for Patrick, an Irishman; **PANTALONE**, name in Italy for taxpayers; **PIOU-PIOU**, French soldier, "worm

crusher"; **POT DE BIERE**, French name for an English soldier; **PICKLEHERRING**, a Dutchman, in allusion to his love for soused herring; **POLACK**, a Pole; **REDSKANKS**, a Scotch Highlander; **RED HEADS**, or **RED TURBANS**, Mohammedans; **ROBERT MACAIRE**, a Frenchman; **ROINECK** (*Wry neck*), a Britisher (*Dutch South Africa*); **SAMBO**, a negro; **SAMMY**, a Scotchman; **SAWNEY**, from Sandy, a Scotchman; **SURLEY BOY** (from *Sorley buie*, yellow hair), an Irishman; **TAFFY**, a corruption of David, a Welshman; **UNSPEAKABLE TURK**; **UNBLEACHED AMERICAN**, negro; **DIXIE**, a popular term for the Southern States, was probably derived from the geographical line drawn by Mason and Dixon which formerly separated the Northern from the Southern States. "Dixie land," made popular by a negro minstrel song, passed into current use as the name of the happy, abundant South. **YANKEE**; the best authorities agree that the word is derived from the imperfect effort made by the Northern Indians to pronounce the word English. "Yengees" was the nearest they could get to English. The contemporary Southerners were called by the Indians "Long knives," on account of their swords. "Yankeedom" is the nickname for New England. "Yankee Doodle" was the name given to a song, "The Yankee's Return from Camp," describing the raw recruits of 1775.

American Civil War Nicknames.— The Southerners were **SECESH**, or more good-naturedly, **JOHNNY REB** (rebels). Johnny was probably taken from Johnny cakes. The Northerners were **YANKS**, or **BOYS IN BLUE**, or **BLUE-BELLIES**. The North had also **DOUGHFACES**, Northern abettors of slavery, deriving their names from the kneadable character of dough. John Randolph of Roanoke branded the 18 Northern congressmen who helped to displace Mason and Dixon's Line as "doughfaces." **COPPERHEADS** was applied to the Northern faction in secret sympathy with the Southern "rebels." These retorted upon the Union men by calling them **NIGGERHEADS**. **BUTTERNUTS** was applied to sympathizers of the rebels, so-called from the uniforms worn in the early part of the war by the Confederate soldiers, which, being homespun, were dyed with the juice of the butternut. Radical Republicans were nicknamed **RADS**. Officials who were not expected to expose themselves to the enemy were called **BOMBPROOFS**; a **BUMMER** was a man of erratic behavior, and originally the bummer was called a **BUFFALO**, a name peculiar at first to North Carolina and then spreading throughout the South. The **JAYHAWKERS** combined murder with marauding, and were famous during the bloody strife carried on in Kansas before the Civil War in "Bleeding Kansas." The **MOSSYBACK** was a man of the South who hid in swamps to escape conscription. The **MUSICAL BOX OF THE CONFEDERATES**, also **JEFF DAVIS' BOX**, was the humorous name given to the ill-built, creaking army wagons. The **WOODEN HORSE**, which at one time was thought in the North to be an infernal machine to be sent into Boston or New York harbor, was a secret society organized for political purposes. Military imprisonment of suspected sympathizers with the South was known as the **BASTILLE**, consented to by the Hickory Unionists of the

border States. KU-KLUX-KLAN, a secret association of Southerners formed shortly after the Civil War to preserve order during a period when lawlessness was rife in the South. The name was an alliterative corruption of the Greek word meaning circle and Klan was added. "The Ku-Klux-Klan," says the *Memphis Appeal* (1871), was a secret political organization which, by their ghostly apparel in which they traversed the country, was intended to appeal to negro superstition and prevent devastations at night. But radicalism raised such a howl and thieves assuming the Ku-Klux garb, the organization was finally abandoned." This organization was also called the WHITE LEAGUE. See also KU-KLUX-KLAN.

World War Nicknames.—When the American soldiers found themselves in France and taking part in the great struggle, they discarded the numerical names of their divisions and substituted nicknames that applied descriptively to each particular group of fighters. General Pershing's history of American troops in France, from the time they arrived in 1917 up to the time the armistice was signed, showed that there were 40 divisions of "Doughboys" across the Atlantic. Nearly all of these gave themselves nicknames: the 26th Division, composed of National Guardsmen from the New England States, was known as the "New England Division"; the 27th Division was the "New York Division"; the 28th Division was the "Pennsylvania Division"; the 29th Division, composed of men from New Jersey, Delaware, Maryland, Virginia and the District of Columbia, was the "Blue and Gray Division," reminiscent of the Civil War; the 31st Division, composed of men from Georgia, Alabama and Florida, was the "Dixie Division"; the 33d Division was the "Illinois Division"; the 37th Division, from Ohio, was called the "Buckeye Division"; the 77th, from Camp Upton, near New York, the "Metropolitan Division"; the 84th, from Illinois, Kentucky and Indiana, the "Lincoln Division," and the 36th, the "Panther Division" from the fighting panther on their insignia and the Latin motto meaning "We'll do it in spite of hell." The men came from Texas and Oklahoma. The 85th, from Camp Custer, of Wisconsin, Michigan, Kentucky, Indiana and Illinois, was called the "Custer Division." The 78th Division, composed of men from New York, New Jersey and Pennsylvania, was called the "Lightning Division." The 80th, made up of men from the mountains of Virginia, was called the "Blue Ridge Division." The 41st, its members coming from Oregon, Washington, Idaho, Montana, Wyoming and North Dakota, was known as the "Sunset Division." The 42d had gained an enviable reputation as the "Rainbow Division" long before it sailed for the battlefields of France. This famous division was composed of the National Guard of New York, Louisiana, Pennsylvania, Wisconsin, Ohio, Georgia, Alabama, Iowa, Illinois, Indiana, Minnesota, Maryland, South Carolina, Colorado, Missouri, Virginia, North Carolina, Texas, New Jersey, Tennessee, Oklahoma, Michigan, District of Columbia, California, Nebraska and Oregon. The 91st Division, which, together with the 37th, was sent to help the French army in Belgium, composed of men from Oregon, Wash-

ington, Colorado, Nevada, Utah, Idaho, Montana and Wyoming, was the "Wild West Division." The 80th Division was known as "Lee's Division," named for Gen. Robert E. Lee, and composed of men of the Southern States.

Among the many nicknames of the war one of the most popular is that of DOUGHBOY. Doughboy was primarily a dough-cake baked for sailors; then it was applied to a brass button of similar shape worn by the infantry, and lastly to a foot soldier. The name occurs in Ringrove, 'Bucaniers of America' (1685); Damfier's 'Voyages' (1697), and in several of Mrs. Custer's books. The latter says in 'Tenting on the Plains': "Early in the Civil War the term was applied to the large globular brass buttons of the infantry uniform, from which it passed by natural transition to the infantrymen alone"; and also, "She was so accustomed to fast riding with our cavalry she does not know how to treat a doughboy." A doughboy is also a small round doughnut served to sailors on shipboard.

State and City Nicknames.—The American love for nicknames also is shown by the familiar titles given to States and cities. Arkansas is the "Bear State," a name given when bears abounded. California is the "Grizzly Bear State." Connecticut is the "Blue Law State," from the unenviable fame acquired by the first regulations of the government of the New Haven colony known as the Blue Laws; the "Freestone State," from the quarries of freestone; and the "Nutmeg State" from the alleged manufacture of wooden nutmegs. Delaware is the "Blue Hen State," from the notoriety that one of her sons, Captain Caldwell, acquired in the Revolutionary War for his love of cock-fighting, and also his well-drilled men known in the army as the "game cocks." His idea that a blue hen produced the best cocks gave rise to the appellation. Florida is the "Gulf State." Georgia is the "Cracker State," from the Crackers,—the most ignorant and lowest of its inhabitants. Illinois is the "Prairie State" and also the "Sucker State," from the numerous holes in the prairies made by the crawfish, into which the thirsty native traveler inserted a reed to draw forth refreshing water. Indiana is the "Hoosier State," said to have been derived from the call "Who's here?" Iowa is named the "Hawkeye State," from a great Indian chief, the terror of the early settlers; Kansas is the "Garden State," also called the "Squatter State," from the early settlers. Kentucky is the "Corn-Cracker State," and also "Bear State." Louisiana is the "Pelican State," from the bird that frequents the marshes, and "Creole," from its original French and Spanish colonists. Massachusetts, known first as the Colony of Massachusetts Bay, is the "Bay State." Maine is the "Pine Tree State." Maryland is the "Old Line State," from the Old Line regiments which he contributed to the Continental army in the War of the Revolution. Michigan is the "Wolverine State," from the little wolves abounding there; also the "Lake State." Minnesota is the "New England of the West." Mississippi is the "Mudcat State," from the numbers of cat-fish. Missouri is the "Bullion State," in allusion to Col. Thomas H. Benton who, being an advocate of gold and silver currency in Congress, was called "Old Bullion." New Hampshire is the

"Granite State," from its granite rocks. New York is the "Empire State," as surpassing all other States in wealth and population; also the "Excelsior State," from the motto on its coat-of-arms. North Carolina is the "Turpentine State." Ohio is the "Buckeye State," from the chestnut which grows there, whose fruit has a spot like a deer's eye. Pennsylvania is the "Keystone State," the central State when the Union was formed. Rhode Island is "Little Rhody," because of its size. South Carolina is the "Palmetto State." Texas is the "Lone Star State," because of the one star in her original coat-of-arms. Vermont is the "Green Mountain State." Virginia is called the "Old Dominion," a name earned in times of peril by her loyalty to Charles II. Wisconsin is called the "Badger State," on account of its many badgers.

Baltimore, Md., is called "Monumental City," having had monuments in her squares before other towns in the United States and boasting of the large and handsome Washington Monument. Boston has several nicknames. One is the "Athens of America," which caused the witty John Randolph of Roanoke to remark, "Boston may be the Athens of America, but it has never been my good fortune to meet with any of the Athenians." Oliver Wendell Holmes dubbed Boston "The Hub of the Universe," and Boston has also been called the "City of Notions" because of the mental attitude of its citizens, and the "Tri-mountain City," because it is built on three hills. This, the oldest appellation, survives in Tremont Street and Tremont Hotel. Brooklyn is the "City of Churches"; Buffalo is the "Queen City of the Lakes"; Chicago is the "Garden City"; Cincinnati is the "Queen City"; Cleveland the "Forest City"; Detroit the "City of the Straits"; Duluth the "Zenith City of the Unsalted Seas"; Galena the "Crescent City of the Northwest"; Hannibal the "Bluff City"; Hartford the "Charter Oak City" from the large oak tree, no longer in existence, in the cavity of which the charter of the colony of Connecticut was concealed by the legislature when James II, in 1686, sent Sir Edmund Andros across the seas to take possession of the charters granted to the colonies; Indianapolis is the "Railroad City"; Keokuk the "Gate City," on account of its situation at the foot of the Lower Rapids of the Mississippi River which opens here to navigation; Louisville, Ky., is called "Falls City," because it is at the head of the Louisville Falls of the Ohio River; Lowell, Mass., the "Spindle City," on account of its cotton factories; Montpelier, Vt., the "Green Mountain City"; Nashville, Tenn., the "City of Rocks"; New Haven, the "Elm City"; New Orleans, the "Crescent City," because the Mississippi makes a bend here; New York, the "Empire City," also "Gotham," derisively applied by Washington Irving in his 'Salmagundi'; Philadelphia, the "City of Brotherly Love" and the "Quaker City"; Portland, Me., the "Forest City"; Pittsburgh, the "Iron City"; Rochester, the "Flower City" and "Flour City," in allusion to its nursery trade and flour-mills; Savannah, the "Garden City"; Springfield, Ill., "Flower City"; Saint Louis, the "Mound City," from being built on the burial places of In-

dians; San Francisco, the "Golden City," also "Frisco"; Washington, D. C., the "City of Magnificent Distances" and the "Federal City."

NICOBAR (nik-ō-bār') **ISLANDS**, a group of 19 islands in the Bay of Bengal, 12 inhabited (total area 635 square miles), with the Andamans (q.v.), 75 miles to the north and forming together a province of British India. The Nicobars consist of two groups—a southern group, composed of the islands Great and Little Nicobar and several smaller islets, and a northern group, separated from the southern by Sombro Channel, about 36 miles broad. The largest island is Great Nicobar, 30 miles long by 12 miles broad, and the next Kamorta, which is the largest of the northern group. The highest mountain, Thuillier (2,105 feet) is on Great Nicobar. They yield cocoanuts, plantains, teak, sassafras, lemons, limes, oranges and pineapples. The thick forests and heavy dews render the climate unhealthful for foreigners. The rainfall varies from 165 inches in moist to 93 in dry years. The cocoanut palm yields the chief food of the natives and is almost the only tree cared for by them, about 15,000,000 being exported annually. Water is obtained by digging. The people belong to two races, an inland tribe, little civilized, who show Mongolian affinities and are regarded as indigenous, and the coast people who are of mixed Malay blood, but idle and lazy. They collect and export trepang and edible birds' nests. The archipelago known from the time of Ptolemy was the scene of Jesuit missionary activity from at least early in the 17th century and of Moravian after 1768, was occupied by Denmark, 1756–1856. In 1869 it was annexed by Great Britain, to put a stop to the piracy of the people. A penal colony which existed at Nancowry on the island Kamorta, was withdrawn in 1888. Pop. 8,818.

NICOBAR PIGEON. See PIGEON.

NICODEMUS, nik-ō-dē'mūs, ruler of the Jews, that is, a member of the Sanhedrin, who belonged to the sect of the Pharisees, and is only mentioned in the Fourth Gospel. He came to see Jesus secretly by night (John iii) and eventually after the Resurrection is traditionally said to have become one of his disciples. He protested against the injustice with which Jesus was treated by the council (John vii, 50) and after the crucifixion joined with Joseph of Arimathea in giving fitting sepulture to his body (John xix, 39). Some commentators have fancifully identified Nicodemus with the rich young man (Mark x, 17–24), but there is no solid ground for the conjecture.

NICOL, nik'ol, **Ersine**, Scottish artist: b. Leith, 3 July 1825; d. 8 March 1904. He was educated in art at the Trustees' Academy, Edinburgh, under Sir William Allan. He resided some time in Dublin, where he painted portraits and subjects of humorous genre. In 1850 he settled in Edinburgh and in 1862 in London; but for 25 years a portion of the year was spent in Ireland, where he gathered material for and painted his numerous clever pictures of Irish peasant life, among which may be mentioned 'Donnybrook Fair' (1859); 'Paddy's Mark' (Corcoran Gallery, Washington); 'Paying the Rent' (Vanderbilt Collection, New York); 'The Day After the Fair'

(Scottish National Gallery); 'Beggar My Neighbour' (Glasgow Corporation Gallery). He was elected a member of the Royal Scottish Academy in 1859.

NICOL PRISM, a piece of apparatus invented in 1828, by William Nicol, for the production of a beam of plane-polarized light. Its

operation is based upon the fact that when a beam of ordinary light enters a crystal of Iceland spar (crystallized calcite) from certain directions, it is decomposed into two beams, each of which is plane-polarized. One of these beams is called the "ordinary ray" and the other the "extraordinary ray"; and as the mineral exerts a different refractive power upon the two, they are divergent within the crystal. Nicol conceived the idea of introducing a surface of discontinuity within the crystal, disposed at such an obliquity that one of these rays would be totally reflected, while the other would be transmitted, and allowed to emerge from the crystal in a direction parallel to that in which the incident beam entered it. His prism is made by cutting a rhomb of Iceland spar as indicated by the plane ABCD, in Fig. 1, which passes through the obtuse angles of the crystal. The surfaces being then polished, the parts are cemented together again with Canada balsam, as shown in Fig. 2. The ends are

ground so as to make an angle of about 68 degrees with the length of the rhomb, and a ray of ordinary light, upon entering the crystal as indicated at AB, in Fig. 2, is separated into two rays. Both are refracted, but the "ordinary ray," BD, is refracted more than the "extraordinary" one, BC; and BD strikes the plane of section of the crystal at such an obliquity that it is totally reflected to E, while BC, striking it at a less obliquity, passes through and emerges from the crystal at F. The sides of the rhomb are usually blackened, so that the ordinary ray is absorbed at E, and destroyed. The Nicol prism is exceedingly valuable, as it gives a beam of light that is completely polarized and entirely without color, when the incident light is white.

NICOLA, nik'ō-lā, Lewis, American soldier: b. Dublin, Ireland, 1717; d. Alexandria, Va., 9 Aug. 1807. He entered the English army in 1740, rose to the rank of major, but resigned and emigrated to America, where he settled in Philadelphia. During the American Revolution his military experience was of great assistance to the colonies and in 1783 he became brigadier-

general. It was he who wrote to Washington what is known as the 'Nicola Letter,' in which it is suggested that the latter should be made king. He wrote 'A Treatise of Military Exercise' (1776).

NICOLAI, nē'kō-lī, Christoph Friedrich, German publisher and author: b. Berlin, 18 March 1733; d. there, 8 Jan. 1811. From his father he inherited in 1752 the business of the Nicolai Publishing Company, which he made one of the foremost in Berlin. In his youth he was a friend of Lessing and of Moses Mendelssohn, with whom he founded the *Bibliothek der schönen Wissenschaften* (1757), a critical review, and another literary journal, the *Briefe die neueste Litteratur betreffend* (1761). But little by little he broke with the leaders of German thought and began to attack in a narrow and futile spirit both the critical school and the romantic movement, the significance of which he was quite incapable of appreciating. Goethe and Schiller replied in 'Xenien' to his parodies of 'Werther' (1775), etc. Nicolai wrote a novel with a rationalistic purpose, 'Sebaldu Notherker' (1773), and merits praise for his excellent 'Description of a Trip through Germany and Switzerland' (1789), and for the historical value of his 'Anecdotes of Frederick II' (1788-92). Consult the autobiography, edited by Löwe (1806), and the 'Life' by Göckingk (1820).

NICOLAI, Otto, German composer: b. Königsberg, Prussia, 9 June 1810; d. Berlin, 11 May 1849. He received his musical education from B. Klein of Berlin and his first work produced in public was a 'Te Deum' performed at the Singakademie in 1833. In 1833 the Chevalier Bunsen obtained for him the post of organist at the chapel of the Prussian embassy in Rome, where he made careful study of Italian church-music. He was conductor of a theatre at Vienna 1837-39 and kapellmeister of the Court opera 1841-47 and subsequently of the Berlin opera. He founded the philharmonic concerts at Vienna for the purpose of securing worthy renderings of the Beethoven symphonies. His best-known work is his 'Die lustigen Weiber von Windsor' (libretto by S. Mosenthal), first presented at Berlin 9 March 1849, which won and maintained great success by its humorous characterization, invention and technical skill. Consult Mendel, 'Life' (1866), which contains a list of all Nicolai's works, printed and in manuscript, and Kruse's 'Otto Nicolai and his Life as an Artist' (Berlin 1912).

NICOLAIEF, nē-kō-lī'ēf. See NIKOLAIEFF.

NICOLAITANS, nik-ō-lā'i-tanz, a sect mentioned in Rev. ii, 6, 15, as given over to idolatrous practices and impurity of life. They thus contravened the decree of the Council of Jerusalem, Acts xv, 20-29, and were accordingly accounted heretics. But the reference in the Revelation may be purely allegorical, in keeping with the symbolical allusiveness of the book. There is no ground for supposing that such a sect was founded by Nicolas, the proselyte of Antioch, who was one of the seven deacons. This name was given to a Gnostic sect of the 3d century, and it has been applied variously in an abusive and party spirit in later times. Consult 'Encyclopedia of Religion and Ethics.'

NICOLARDOT, Louis, loo-ē nē-kō-lār-dō. French author: b. Dijon, France, 28 Nov. 1822; d. Paris, France, 21 Nov. 1888. His literary work is favorably known and among his more notable publications are 'Journal of Louis XVI' (1873); 'The Impeccable Theophile Gautier' (1883); 'La Fontaine and the Human Comedy' (1885), etc.

NICOLAS, nīk'ō-lās, **SIR Nicholas Harris**, English antiquarian: b. Dartmouth, 10 March 1799; d. near Boulogne, 3 Aug. 1848. He was of French Protestant descent; served eight years in the navy (1808-16); studied law, and became the leading genealogist of his day. Hood, for instance, says that Miss Kilmansegg's ancestry "Were enough, in truth, to puzzle Old Nick, not to mention Sir Harris Nicolas." Among his many works are 'Notitia Historica' (1824); 'History of Agincourt' (1827); 'Proceedings and Ordinances of the Privy Council of England, 1386-1542' (1834-37); 'Despatches and Letters of Lord Nelson' (1844-46), and 'History of Royal Navy' (down to Henry V, 1847). He was created K.C.M.G. in 1832.

NICOLAUS (nīk-ō-lā'ūs) **OF DAMASCUS**, Greek historian. He lived in the time of Herod the Great and was intimate with that monarch and with Augustus. He tutored the children of Antony and Cleopatra. Of his writings, a 'Universal History' in 144 books, and his biography of Augustus, fragments of great value, remain. Consult Müller, 'Fragmenta Historicum Græcorum' (Vol. III, pp. 343-464).

NICOLAY, nēk'ō-lā, **John George**, American author: b. Essingen, Bavaria, 26 Feb. 1832; d. Washington, D. C., 26 Sept. 1901. He came with his family to the United States in 1838 and settled in Illinois, where he was educated in the public schools. He entered the office of the *Free Press* in Pittsfield, Ill., when 16 and later became its proprietor and publisher, soon making himself a political power in the State. In 1856 he entered the office of the secretary of state at Springfield, Ill., where he became a devoted adherent of Lincoln. When the latter was elected to the Presidency Nicolay was appointed his private secretary and as the duties of the office increased John Hay (q.v.) was selected as assistant secretary. Together they formed the plan of writing a biography of President Lincoln and gained his approval of their project. In 1865 Nicolay was appointed by the President to be United States consul at Paris, where he remained until 1869 and in 1872-87 he was marshal of the Supreme Court. In 1874 he began in collaboration with John Hay 'Abraham Lincoln, a History,' the authoritative biography, published serially (1886-90) and in book form and supplemented by Lincoln's 'Complete Works,' in 12 volumes (1894). He also wrote 'The Outbreak of the Civil War' (1881). His daughter, **HELEN NICOLAY**, who has inherited her father's absorption in the life and achievement of the great President, is the author of 'Personal Traits of Abraham Lincoln' (1912).

NICOLE, François Léon Etienne, frānswā lā-ōn ā-tē-ēn nē-kōl, Haitian poet: b. near Grande Rivière, 1731; d. Cape Français, 1773.

Educated in a Jesuit college, he went to Paris in 1750, where Voltaire introduced him to the Encyclopedists and Louis XV granted him a pension in recognition of his talents. In 1769 he returned to Haiti, where he was in the governor's employ. He published 'The Romance of the Slave' (1766); 'Tropical Flowers' (1770), and 'New Poems' (1772).

NICOLE, Pierre, French moralist: b. Chartres, 19 Oct. 1625; d. Paris, 16 Nov. 1695. Graduated from the University of Paris in 1644, he took minor orders; he was a member of the Port Royal community, held a professorship in it, wrote many of its schoolbooks, was one of its controversialists with the Jesuits and shared in its vicissitudes, being forced to retire to Belgium, but returning in 1683. The Abbé Goujet, who wrote his 'Life' (1732), says that he aided in the preparation of some of Pascal's 'Provincial Letters' (1656), and translated the series into Latin (1658). His best work is in his 'Essais de Morale' (14 vols., 1671 et seq.), one of which 'On the Means of Preserving Peace,' was praised rather extravagantly by Voltaire.

NICOLÉ, in Molière's 'Bourgeois Gentilhomme,' a servant of the Monsieur Jordain, who understands and exposes her master's follies in an amusing way.

NICOLET, nee-coe-lay, Canada, a town in Nicolet County, Quebec, at the mouth of the Nicolet River on Lake Saint Peter, 82 miles northeast of Montreal, on the Intercolonial and the Quebec, Montreal and Southern railways. It is the seat of Nicolet County and an enterprising manufacturing town. Sash and door factories, brick yards, tanneries and foundries are situated here and also factories for aerated waters, machine-shop products and optical appliances. Nicolet has a Roman Catholic cathedral, college, seminary and two monasteries. It also possesses a commercial academy, county buildings and a hospital. Pop. 2,593.

NICOLINI, nē-kō-lē'nē, **Ernesto**, French singer, whose real name was Ernest Nicolas: b. Saint-Malo, 1834; d. Pau, January 1898. His splendid tenor was trained at the Conservatoire. He made his début in Paris in 1857, soon afterward devoted himself to Italian opera and Italianized his name, returned to Paris and then toured Europe. His last years were spent off the stage, because of ill-health. He married Adelina Patti in 1886 with whom he toured.

NICOLL, **SIR William Robertson**, Scottish clergyman and editor: b. Aberdeenshire, 10 Oct. 1851; d. 4 May 1923. He graduated at the University of Aberdeen in 1870 and was Free Church minister of Dufftown (1874-77) and Kelso (1877-85). He became editor of several periodicals, including the *British Weekly*, the *English Bookman*, the *Expositor* and (1900) the *British Monthly*. Among his publications are 'Calls to Christ' (1881); 'John Bunyan' (1884); 'Ten-Minute Sermons' (1895); 'The Key of the Grave'; Sunday Afternoon Verses' (1897); 'Letters on Life' (1901); 'The Church's One Foundation' (1901); 'Life of Maclaren' (1908); 'The Round of the Clock'; 'Emily Brontë'; 'The Expositor's Dictionary of Texts'; and 'Sunday Evening' (1910). He edited the 'Expositor's Greek Testament'

(1897-1900); was an authority on the Brontës and was responsible for a complete edition of Charlotte Brontë's works; was library adviser to the publishing house of Hodder and Stoughton and the most distinguished of Non-Conformist journalists. He was knighted in 1909.

NICOLLET, nê-kō-lā, **Jean Nicolas**, French explorer and geologist: b. Cluses, Savoy, 24 July 1786; d. Washington, D. C., 11 Sept. 1843. He came to the United States in 1832 to make a scientific investigation of the Southern and Western States, and was later engaged by the United States government to make an exploration of the far West. He published 'Mémoire sur le mesure d'un arc de parallèle moyen entre le Pole et l'Equator' (1826); 'Cours à l'usage de la marine' (1830); 'Cours de mathématiques'; and a 'Report on the Hydrographical Basin of the Upper Mississippi' (1841), with a map (1843), etc.

NICOLLS, nîk'ôlz, **Mathias**, English colonial jurist: b. Plymouth, England, about 1630; d. Long Island, N. Y., 22 Dec. 1687. He was appointed secretary of the commission and captain under Col. Richard Nicolls, who was sent to capture New Netherlands in 1664. He became the first secretary of the province and a member of the governor's council. He was the chief compiler of the first code of English laws in New York, known as the "Duke's Laws." Later he was presiding judge of the Court of Assizes; in 1672 he was elected third mayor of New York, became first judge of the Court of Common Pleas, and in 1683 was appointed a judge of the Supreme Court of the colony.

NICOLLS, **Richard**, English colonial governor: b. Amptill, Bedfordshire, England, 1624; d. at sea, 28 May 1672. During the Civil War in England he joined the king's army, was placed in command of a troop of horse, and when the Royalists were defeated fled to Holland, where he entered the service of the Duke of York, serving with him in the Continental Wars. On the accession of Charles II he was appointed gentleman of the bed-chamber to the Duke of York. In 1664 the king made him the chief of a commission appointed to settle the affairs of the New England colonies and to take New Netherlands from the Dutch, the claim to which was based on priority of discovery and was equivalent to a declaration of war. He sailed from England in June of the same year, and after stopping at Boston for a short time reached New Amsterdam on the 25th of August. The Dutch surrendered to him without resistance; he took formal possession of the city on 8 September, the Dutch officials shortly after taking the oath of allegiance to the English king. Nicolls changed the name of the province and the city of New Amsterdam to New York; and also gave Albany its present name. In 1665 he proclaimed the "Duke's Laws" which had been prepared under his direction; this was the first code of laws in New York, and combined features of the English law with the Roman-Dutch law formerly prevailing in the province. In the same year he gave an English form of city government to New York City. His administration was efficient, and especially moderate and con-

siderate toward the Dutch, and he was respected and trusted by English and Dutch alike. In 1666 he successfully settled some difficulties with the French and Indians; in 1667 resigned but did not leave the colony till the arrival of his successor, Lovelace. He returned to England in 1668, and taking part in the war between England and Holland, was killed in the naval battle against De Ruyter in 1672.

NICOMACHUS, nî-kôm'ā-kūs, surnamed **GERASENUS**, Neo-Pythagorean philosopher: b. Gerasa, Palestine, about 1st century A.D. He was one of the earliest writers on mathematics and music, and his name became a synonym for mathematical accuracy. "You number like Nicomachus of Gerasa" being a Philopatris proverb. He wrote a life of Pythagoras and several musical and mathematical works which became lost. Enough, however, remained of his work to greatly influence learning in the 15th and 16th centuries.

NICOMEDIA, nîk-ō-mē'dî-ā, Asia Minor, an ancient city of Bithynia, its site occupied by the modern Izmid or Izmikmid (pop. 30,000), at the northeast corner of the Gulf of Izmid—the ancient Astacenus,—an arm of the Propontis or Sea of Marmora. It was named after its founder, Nicomedes I (278-250 B.C.), and was a residence of the Bithynian kings, a city of great splendor, and in later times a favorite place of resort with the emperors Diocletian and Constantine the Great. Arrian the historian was a native, and Hannibal committed suicide here. Numerous interesting remains of the city are preserved.

NICOPOLIS ("City of Victory"), ancient Epirus, Greece, in the extreme southern part opposite the promontory of Actium. It was founded in the year 31 B.C. by the Emperor Augustus (Octavian) to commemorate the great naval victory won by him at Actium over Antony and Cleopatra. He named it the City of Victory and made a great city of it. He gathered a large population from the neighboring towns and instituted games—the great Actian games in honor of Apollo Actius—which drew crowds every fourth year. On the spot where Octavian's tent stood he erected a temple to Neptune adorned with the prows of the captured galleys. The city was peopled by colonists from the vicinity, and it soon became the head (Strabo III, xiii, 3; VII, vii, 6 and X, ii, 2). Pliny the Elder called it a "free city" (Book I, p. 274). Saint Paul invited Titus to join him there (Titus iii, 12), from which we may gather the fact that Christians were among the population. Origen was there for a time (Eusebius, Hist. Eccl. vi, 16). At the beginning of the 5th century, it was laid waste by the Goths and was restored by Justinian. In the 6th century it was still the capital of Epirus. About 732 it was incorporated into the patriarchate of Constantinople. In the Middle Ages, the site was built upon and the town of Prevesa arose. Three miles north of the present town are found the ruins of Nicopolis in a place called Old Prevesa on a small bay of the Gulf of Arta, where a narrow isthmus separates the gulf from the Ionian Sea. These ruins consist of the acropolis, two theatres (one with 27 rows of

seats) and an aqueduct which conveyed water from a source 27 miles from the town. Consult Dion Casio Li; Procopius, *Bel-Goth*, iv, 22; Wordsworth, 'Greece,' 229; Leake, 'Northern Greece,' i, 185; Bowen, 'Athos and Epirus'; Merivale, 'Rome,' iii, 327; Lewin, 'Life and Epistles of St. Paul' (4th ed.) iii, 353.

NICOPOLIS, a city in Cappadocia, or Armenia Minor, founded by Pompey on the spot where he defeated Mithradates. It was beautifully situated in a well watered plain, the valley of the Lycus, 100 miles northwest of Satala and 98 miles northeast of Sebastia. It was originally called Tephrike and was colonized by veterans of the army and the neighboring peasantry. As all the Roman highways of this part of the country radiated from this point, Nicopolis soon became a populous city (Strabo XII, iii). Nicopolis was annexed to the Roman Empire in the time of Nero (A.D. 64) and became the metropolis of Lesser Armenia. It had an altar of the Augusti, and temples to Victory and to Zeus Nicephorus. Christianity was introduced into Nicopolis at an early date and under Licinius (about 319) 45 of the citizens were martyred. About 472 a church was erected here to the Virgin. In 499 Nicopolis was destroyed by an earthquake. Justinian rebuilt the walls and erected a monastery to the memory of the 45 martyrs (Procopius, 'De *Ædificiis*,' iii, 4). Under Heraclius it was captured by Chosroes and never regained its splendor. To-day the Armenian village of Purkh (with a population of about 200 families) occupies the ancient site of Nicopolis, in the sanjak of Kara-Hissar and the vilayet of Sivas.

NICOPOLIS, Egypt, city, founded by Octavian (24 B.C.) to commemorate his final victory over Antony and the surrender of Alexandria. The Roman emperor was at this moment highly incensed with the Alexandrians, and, by the foundation of a Roman town in their immediate neighborhood, sought to inflict a permanent blow on their political and commercial supremacy. Nicopolis was built a little west of the Delta on the banks of the canal that connected Canopus with the capital about three miles from its eastern gate. Augustus Cæsar planned to make Nicopolis a city of the first rank. He built an amphitheatre, established games and intended to erect several fine temples, but the natural advantages of Alexandria were greater and Nicopolis was never more than a suburb of its rival. Within a century after its foundation the name of Nicopolis disappears from history. Pliny mentions (vi, 23) a town called Juliopolis, situated on the same canal and about the same distance from Alexandria. In all probability the city was the successor of Nicopolis.

NICOPOLIS, a city in Thrace (Nikup) at the foot of Mount Halmus and at the junction of the Iatrus with the Danube, not far from the mouth of the Nessus. It is said to have been founded by Trajan to commemorate his victory over the Dacians. Upon ancient coins it is called Ulpia. The scholiast upon Ptolemy says it was subsequently named Christopolis. Socrates and Hierocles both called it Nicopolis.

Consult Ptolemy (iii, p. 11). See **NİKOPOL**, **BULGARIA**.

NICOSIA, nē'kō-zē'a, Cyprus, capital and largest city of Cyprus, situated in the north-central part of the island. Its earliest name was Ledra, but Leucon (or Leucos), son of Pomfrey Soter (B.C. 280) restored it and called it Leucotheon, or Levcosia. Constantine fortified it with walls that lasted until the time of the Venetians. Richard Cœur de Lion gave the city in 1193 to Guy de Lusignan, the first of the Lusignan kings (reigned 1192-94). The 300 years during which Cyprus was ruled by the house of Lusignan were the most brilliant in the varied history of Cyprus; and under these kings and queens Cyprus became of an importance out of proportion to its small area and population. Its wealth and luxury in the 14th century evoked the amazement of all Western visitors. The castle was rebuilt in 1211 and a new one was constructed in 1382. The walls, four miles in circuit, were finished by Peter II in 1372 and destroyed by the Venetians, with 80 churches and the famous monastery of Saint Dominic in 1564. In rebuilding the walls the circular form was retained, but the circuit was reduced to three miles. The river Pedias, which had flowed through the city, was turned into a new channel outside it. Nicosia is situated on a barren plain framed by distant hills. In the middle of the town stands the cathedral of Saint Sophia, adopted as a mosque by the Turks in 1570. It was begun early in the 13th century but was injured by an earthquake in 1267. The magnificent west porch dates from the 14th century. Two minarets now replace the western towers and the building is white-washed in accordance with Moslem requirements. Among the other interesting buildings are the palace of the Latin archbishops of Nicosia; the Armenian church; the Haidor Pasha Mosque, formerly Saint Katharine's Church, a purely Gothic building; the diminutive Arablar Mosque of Byzantine origin; the Turkish Bath, formerly the church of Saint George of the Latins; the mosque of the Standard Bearer (Turkish); and the library containing a small but valuable collection of Turkish, Persian and Arabic manuscripts. The old Qonaq, or Palace of Nicosia, disappeared in 1904 for the new palace, containing the courthouse and government offices.

"The older houses," writes a recent traveler, "are nearly all built of mud-colored, sun-dried bricks but here and there may be seen the remains of stone-built houses, with beautiful arched gateways surrounded by coats-of-arms, relics of the Lusignan and Venetian periods. The bazaars afford a considerable variety of scene, they are either under arches, or are covered overhead with trellised vines, or stretched awning of canvas, while each street is appropriated to its own particular trade. The articles offered for sale are vegetables and fruits, rugs, pack-saddles, cottons and silks of native manufacture, hammered copper pots, silver-ware, etc. Every Friday a fair is held, which is largely attended by the inhabitants of the neighboring villages." The town also manufactures leather goods and woolen articles. Pop. (1911) 16,052. Consult Lukach and Jardine, 'Handbook of Cyprus' (London 1913).

NICOSIA, Sicily, a city in the province of Catania, 42 miles west of Catania and 21 miles north of Leónforte. Nicosia is situated on a rocky eminence, 2,840 feet above the level of the sea and also on the Salso River. The town, which presents a thoroughly mediæval appearance, is more behind the age than any other in Sicily. The inhabitants speak a Lombard dialect. Nicosia's origin is unknown; but it was destroyed by the Saracens and reoccupied by the Normans. Among the interesting buildings are a fine Norman cathedral and the church of Sainte Maria Maggiore containing reredos by Antonio Gagini. There are many quaint and picturesque houses. In the vicinity are rich mines of rock salt; beds of alum and sulphur and sulphur springs. The industries of the town are corn, wine, cattle and oil. Nicosia has been the episcopal see of Sicily since 1816. From Nicosia the old road, rocky and picturesque, passes Rocca di Sarno, where the brave Norman Serlo perished through treachery, and leads to Leónforte. Pop. (1911) 16,441.

NICOT, Jean, zhōn nē-kō, SIEUR DE VILLEMAIN, French diplomat: b. Nîmes, 1530; d. Paris, 5 May 1606. He studied in Paris, was a courtier of Henry II and acted as envoy of Francis II to Lisbon (1560), whence, having procured seeds from a Dutchman who brought them from Florida, he introduced tobacco into France. To this circumstance the scientific name for tobacco, *Nicotiana*, is due. Nicot wrote a French dictionary, 'Trésor de la langue française' (1606).

NICOTIANA, nī-kō-shī-ā'na, a genus of plants of the potato family (*Solanaceæ*), represented by the two species of tobacco (*N. tabacum* and *N. rustica*). These plants abound in all their parts with poisonous elements, the special and characteristic one in this case being the alkaloid nicotine, to which tobacco owes its peculiar narcotic properties. See TOBACCO.

NICOTIN, or **NICOTINE**, named from Jean Nicot (q.v.) who introduced the tobacco plant into France, the characteristic alkaloid element of the tobacco plant, in all parts of which it appears in combination with malic and citric acids. When pure and freshly prepared, it is a colorless, intensely poisonous liquid, which evolves a very irritating odor of tobacco, but on exposure to the air it rapidly oxidizes and becomes brown in color. It is moderately soluble in water, and dissolves readily in alcohol and ether. The quantity of nicotine contained in the smoke of burning tobacco leaf varies from about 2 to 8 per cent, the larger percentage being in the coarser kinds. Taken internally, nicotine is one of the most potent of poisons; one-sixty-fifth of a grain taken by the mouth causes symptoms of poisoning to be shown, and a single drop will kill a rabbit or cat in a few seconds. See TOBACCO.

NICOYA, nē-kō'yā, a gulf on the west coast of Costa Rica, extending inland north by west about 60 miles and from 20 to 30 miles in width. Along the shore are high mountains and many picturesque inlets. Cape Blanco is at the entrance. Punta Arenas, on the east shore, is the port of entry.

NICTHEROY, nē-tā-rō'ē, Brazil, a town of Rio de Janeiro, prior to 1894 the capital of

the state, on Praia Grande Bay in the Bay of Rio de Janeiro, opposite the city of that name. It is noted for its elegant suburban residences. Pop. estimated at 40,000.

NICTITATION, nīk'tī-tā'shōn, involuntary winking of the eye, from the Latin word *nictare*, to beckon. It is a slight spasm of the orbicularis muscle of the eye and is often induced by nervousness, hysteria, neurasthenia, etc. "The eyelids sometimes nictitate with an involuntary quiver" is a medical definition of nictitation; and a chronic spasm of the eyelids is spoken of as a "nictitating spasm." Some animals, such as elephants, opossums, seals and the cat tribe, and all birds and fishes, have what is called a third eyelid, or nictitating membrane.

NIDIFICATION is nest-building: that is, the process and practice of arranging or constructing a place for the deposit and protection of eggs and of the young hatched therefrom as long as required by the circumstances of each case. The membranous or glutinous packets in which the eggs of many of the higher worms, mollusks, of some insects, and even of most amphibians (frogs and salamanders, for example) are enclosed, coincident with their voidance by the female, may not be included, because they are not prepared by the mother, but are as natural products as the eggs themselves. Insects and spiders put their eggs in places of safety, or where the young, when they come, will be close to their proper food. When not buried in some way they may be protected by some sort of covering, but this is about all until we come to the highest group—the ants, wasps and bees. The larvæ of insects, however, construct for themselves many and sometimes very remarkable abiding-places, which are certainly "nests" in the broader sense of the term, since they are the shelters within which juvenile growth and transformations, often much prolonged, are carried on; but it is not proper to include mere pupa-cases, such as the cocoons of moths. Thus the white, silken webs that disfigure and injure our fruit-trees are spun by a colony of caterpillars, and form their nest, to which they return nightly after feeding; finally, however, each caterpillar wraps a cocoon about him and sinks into the pupal inertia for the winter, and this wrapping is in no sense a nest. Some insects, however, do make definite homes for eggs and expected young. The most striking examples are found among the wasps and bees, both social and solitary, and the ants, the last-named forming regular nurseries in their colony-habitations, and caring for their larvæ as do the most intelligent mammals for their young. Sufficient details to illustrate these and other cases of insect nidification may be found in the articles ANT; BEE; INSECT; MOTH; WASP, etc. The clearest illustration, probably, is afforded by the common brown wasps (*Polistes*) that make individual paper nests, shaped like inverted wine-glasses, hung by a short stem; they are very often attached to the ceilings of sheds, barn-lofts and the porches of rural houses. These begin with a single cell made in early warm weather by a female wasp that has survived the winter. In this cell she lays a fertile egg, and then proceeds diligently to add other cells around this until finally half a dozen circles have been fashioned. Mean-

while the eggs in the central, first-made cells, have hatched and the grubs grow and must be fed. As they increase, the cells are lengthened, and constant nourishment is given by the busy mother, until finally the earliest grubs escape as mature wasps and begin to help in the care of the rapidly increasing family. This is a real nest.

The examples of nidification among fishes are related in considerable detail in the article FISHES, NEST-MAKING BY.

Among the salamanders, newts, toads, frogs and other amphibia, the eggs are usually inclosed in some sort of gelatinous envelope and laid in the water, in most cases without any particular care, and in others are attached to stones or plants, and probably guarded by the parent. Some newts and frogs coil about or carry the eggs; or, as in the case of the well-known Surinam toad, the eggs are voided from the protruding and turned-up oviduct of the female in such a way that the male, perched on her back, squeezes them into the spongy surface of her back, where they mature in little pockets. Some Eastern frogs and many of the South American tree-frogs have similar devices, but only one makes what might be called a nest. This is the ferreiro or "smith" (*Hyla faber*) of Brazil, which digs up mud in its ponds, and builds around a chosen space a strong wall reaching to, or a little above, the surface of the water. This is done at night by the female, who pats the wall into a firm rampart; and here she lays her eggs, the tadpoles thus hatching and growing in security until able to escape and take care of themselves.

The reptiles in many cases (among snakes and lizards) bring forth their young alive, and when they care for them do so without any previous preparation. The pythons (q.v.) coil around their eggs and thus protect and incubate them. Many snakes worm their way into loose soil or rotting dung-heaps, and leave their eggs to chance. The chameleons and many other lizards scrape a hole in the mold and cover up the eggs left there. That is also the method of the turtles, but they are more careful, for while some simply dig a cavity in the sand of the sea-beach or river-bank, deposit their eggs and cover them up, others take great pains to pack the earth down hard. The well-known green turtle searches long and carefully before she satisfies herself that the spot is suitable, and then digs with her flippers a hole three feet deep, in which she deposits about 200 eggs. The hole is then filled up, and the top leveled off until little or no trace of the operation is visible. That is the practice of the Old World crocodiles, also the gharial, or gangetic crocodile which varies it by burying its eggs deeply in two layers, with a thick layer of sand between them. Our American alligators, however, make much more elaborate preparations for their young as is described under ALLIGATOR.

Birds, of course, furnish the most typical examples of nest-building and of all the other phenomena of nidification, often on a scale that compels wonder at the ingenuity and beauty displayed. See BIRDS, NESTS OF.

Nidification, among mammals, involves a wider use of the term than with birds, at least, and may be defined as any living-place constructed by the animal and formed more or less

like a bird's nest. A striking instance is afforded by the habits of the big anthropoid apes—the gorilla, orang-utan and the chimpanzee. All of these, in a very similar manner, construct platforms of broken branches in trees, upon which to sleep, where the females bring forth and nourish their young. Sir James Brooke, in his 'Ten Years in Sarawak,' says that in the case of the orang-utan, the nest is always built low down, often within 25 feet of the ground, and is three or four feet in diameter and quite flat on top. The Australian bandicoots form compact nests of grass in a shallow hole in the ground, and our American opossums in a hollow log, or broken tree-trunk. The cony (*Hyrax*) of South Africa, and our cony (*Ochotona*), make warm winter-nests within the interstices of loose rocks, and some African lemurs bed-chambers of sticks and leaves in the tree-tops. The chief mammalian nest-builders, however, are found among the arboreal squirrels and the rats and mice of various parts of the world. The European dormouse is an excellent example. The British squirrel forms a nest, "constructed," says Bell ('British Quadrupeda,' 1839), "in a very intricate and beautiful manner, of moss, leaves and fibres curiously interlaced; and it is usually placed either in a hole in a tree, or in a fork between two branches, often where it can with difficulty be distinguished from the tree itself." Our American rodents have similar habits. The flying squirrels of this country form thick warm beds of feathers, hair or other soft materials in abandoned woodpecker-holes and other cranies. Our common gray and fox squirrels, which spend the winter in well-bedded chambers in tree-holes, construct in summer large nests of leaves and leafy twigs, massed together in tree-tops, into which they bore their way, then, by crowding and biting, hollow out the interior into a snug living-room. Our field-mice make warm nests of grass, etc., in hollows of the soil for winter residence; and one of them, the jumping-mouse, weaves a ball of such materials, placed in a bush, into which it creeps for hibernation. Still more remarkable are the similar but larger houses of the wood-rats (*Neotoma*). Thus Cram ('American Animals,' 1902) says of the Alleghany wood-rat that it inhabits rocky ledges among loose piles of broken rocks, "Here he gathers together a mass of sticks, shreds of bark, leaves and other debris to form a nest, building them sometimes into a more regular dome-shaped structure."

ERNEST INGERSOLL.

NIEBELUNGEN LIED. See NIBELUNGEN LIED.

NIEBUHR, nē'boor, Barthold Georg, German historian and classical scholar, the founder of modern historical method: b. Copenhagen, 27 Aug. 1776; d. Bonn, 2 Jan. 1831. He was son of Karsten Niebuhr (q.v.); was educated by his father in his early youth; studied at Kiel (1794-96), at London and at Edinburgh (1798-99); and in 1800 entered the service of the Danish government. He became director of the government's bank in 1804, and showed in this post and in the Prussian service, which he entered in 1806, much business ability, due, so he affirmed, to his life in England and Scotland. A quarrel with Hardenberg made Niebuhr's retirement necessary in 1810, soon after he had

been engaged in financing a Prussian loan in Holland; and he taught Roman history at Berlin for three years with such success that he was led to publish the first two volumes of his 'Roman History' (1811-12). But in 1813 he re-entered the Prussian government employ, and took a prominent part in rousing national opposition to Napoleon; but his temper was overbearing and he soon broke with his superior, Stein. In 1816 he was sent as Minister to the Vatican, brought about the understanding between Prussia and the Pope signalized by the bull 'De Salute Animarum' in 1821, and had his first opportunity of testing his critical theories as to early Roman history by topographical and other detail. In 1823 he retired from the diplomatic service and settled in Bonn, where he lectured on ancient and modern history.

Niebuhr's great and epoch-making work was his destructive criticism of the early Roman legendary period and his reconstruction of this same period from the mass of myth and legend, which beclouded it, or, to put it more broadly and more truly, it was his application of this higher critical method to history. His 'Roman History' (1811-32, English version, Hare and Thirwall, 1851), carrying the story of Rome down to the Punic Wars, was completed in an English form by Leonhard Schmitz in 'Lectures on the History of Rome from the First Punic War to the Death of Constantine' (1844). These two parts form a great collection of facts and material, and a wonderful exemplification of method, but the more popular and brilliant style of Niebuhr's pupil, Theodor Mommsen (q.v.), has made Niebuhr's work to a certain degree antiquated. He collaborated with Platner and Bunsen in their 'Description of the City of Rome'; founded with Böckh and Brandis the *Rheinisches Museum*, a classical review; edited the 'Corpus Scriptorum Historiæ Byzantinæ'; and wrote many minor philological and historical studies, besides editing new fragments of Gaius, Cicero and Merobaudes. His 'Stories of the Greek Heroes' ('Griechische Heroengeschichte,' 1842), originally written for his son, Marcus, is a famous juvenile. Niebuhr was possessed of original genius, had an intuitive grasp of history that made him detect the false evidence and was so adept at learning languages that he had mastered 20 in early manhood. He was also a man of broad scholarship and catholic taste, as may be seen by his personal reminiscences and correspondence in Hensler's 'Lebensnachrichten über Niebuhr' (1838-39). Consult also the biographies by Classen (1876) and Eyssenhardt (1886); and Winkworth, 'Life and Letters' (1852).

NIEBUHR, Karsten, German traveler, father of B. G. Niebuhr (q.v.): b. Lüdingworth, Hanover, 17 March 1733; d. Meldorf, Prussia, 26 April 1815. In 1760 he entered the Danish service as lieutenant of engineers, and in 1761 joined the expedition sent by Frederick V of Denmark to explore Arabia, Egypt and Syria. All his companions in this expedition died within a year after their departure, but in spite of these distressing discouragements, he pursued his work single-handed, and in 1766 returned to Copenhagen. The works in which he gave the world the result of his expedition are classics and remarkable for their accuracy.

They include 'Breschreibung von Arabien' (1772); 'Reisebeschreibung von Arabien und anderen umliegenden Ländern' (1774-78). Consult his son's 'Karsten Niebuhr's Leben' (1817; Eng. trans., 1838).

NIECKS, nēks, Frederick, Anglo-German composer and critic: b. Düsseldorf, Germany, 3 Feb. 1845. He was educated at Leipzig University and was a violinist and music teacher in his native city till 1868 when he settled in Scotland, where he was for some years engaged in teaching music, and since 1875 he has written much for musical journals. From 1891 to 1914 he was Reid professor of music at the University of Edinburgh. He has published 'A Concise Dictionary of Musical Terms' (1884); 'Chopin as a Man and Musician' (1888); and 'Programme Music in the Last Four Centuries' (1908).

NIEDERMEYER, nē'dēr-mī-ēr, Louis, Swiss composer: b. Nyon, 27 April 1802; d. Paris, 14 March 1861. He studied under Moscheles in Vienna, and in Italy with Fioravanti and Zingarelli and settled in Paris. He met with no great success in operatic music, such as 'Marie Stuart' (1844) and 'La Fronde' (1853), and thereafter devoted himself to religious music, his true vocation, not only composing but teaching and editing a journal called *La Meitrise*. His opera 'Stradella' and his melody for Lamartine's 'Lac' are his best compositions of a secular sort. His training school for religious music was aided by the French government.

NIEDERWALD, nē'dēr-vält, Germany, the western termination of the Taunus range in the Prussian district of Wiesbaden, abutting on the Rhine opposite Bingen. On a commanding site near its summit was erected, 28 Sept. 1883, the national memorial commemorative of the successful War of 1870-71. An extended pedestal, ornamented with allegorical figures, is surmounted by a bronze figure of Germania, 34½ feet in height. The whole was designed by Schilling, a Dresden sculptor. Toothed-railways carry visitors up to the monument from the villages of Rüdesheim and Assmannshausen at the foot, both noted for their wine.

NIEHAUS, nē'hous, Charles Henry, American sculptor: b. Cincinnati, Ohio, 24 Jan. 1855. He was educated at the public schools and the McMicken School of Art; and on the savings of his boyish years proceeded to Munich, Bavaria, where he won high distinction. After his residence in Germany he returned to the United States, proceeding again to Europe and setting up a studio in Rome from 1881 to 1885. His fame as a sculptor was meantime growing. He is equally expressive with the chisel as with the modeling tool. No sculptor has been more associated with memorials of a public character than he. Among monuments may be cited the Hahnemann and Paul Jones monuments at Washington, D. C.; the equestrian monuments to Drake at Titusville, Pa., and to General Forrest, at Memphis, Tenn.; the apotheosis of Saint Louis at Saint Louis, Mo.; the Astor historical doors to Trinity Church, New York; and the pediment to the State House at Kentucky. Among busts may be mentioned those of Disraeli, Dr. Collyer, Robert Blum, Joseph Jefferson, Rabbi Gottheil, Hon. Charles Hack-

ley and Governor Hoadley. His ideal works include the *Cæstus* in the Metropolitan Museum, New York, the 'Greek Athelete using a Strygil.' His statues include those of Garfield at Cincinnati and the Capitol, Washington; Governor Allen of Ohio, Ingalls and Morton in the rotunda of the Capitol, Washington; Moses and Gibbon in the Congressional Library; Farragut and McKinley at Muskegon; and a statue of McKinley and lunette for his tomb at Canton, Ohio. He has executed three statues of President Lincoln, the first a seated figure of heroic size in bronze, the property of the Historical Society of Buffalo, N. Y.; the second, almost a replica of the first, is at Muskegon. His third statue, exhibited in 1916 which is in Cressele marble, is regarded as a most successful presentation and reveals almost perfectly the deeply brooding expression habitual to the countenance of the martyred President. Mr. Niehaus was awarded gold medals at Buffalo in 1901; at Charleston in 1902; and Saint Louis in 1904. He was elected a member of the National Academy in 1906. Consult Armstrong, 'Charles Niehaus' (New York 1902).

NIEL, nē-ěl, **Adolphe**, French marshal: b. Murat, Haute-Garonne, 4 Oct. 1802; d. 14 Aug. 1869. He was educated at the École Polytechnique, Paris, and the Military School, Metz, and in 1835 became captain of engineers. He took part in the expedition against Constantine in Algeria 1836-37; commanded the engineers at the siege of Rome in 1849 during the revolutionary movement under Garibaldi; took part in the bombardment of Bomersund in the Baltic in 1854, and as chief of engineers planned the operations against Sebastopol in 1855. He figured prominently at Magenta and Solferino in the Italian campaign of 1859, was made a marshal of France by Napoleon III in return for his service and in 1867 became Minister of War. The *Marshal Niel* rose derives its name from him.

NIELLO WORK, in art, a method of ornamentation described among other old writers by Pliny, and much practised in the Middle Ages, and to which may be traced the origin of engraving. The lines of a design are cut in a piece of gold or silver; it is then covered with a black composition consisting of copper, silver, lead and sulphur, and a little borax is sprinkled over it by subjecting it to heat over a fire; the composition becomes liquid and runs into the lines of the design; the whole is then allowed to cool, when the surface of the metal is scraped and burnished, leaving the drawing in black upon the metal. Plaques so ornamented were principally employed in the making of church plate and reliquaries and for costly personal ornament. The art is still practised by goldsmiths as a mode of ornamenting ware, especially in Russia and India, but its principal use is for door-plates, plates for shop fronts, etc., in which the brass or zinc plates are engraved and the depressions filled with wax. The term is also applied to impressions in a viscid water-ink on paper from metal-plate engravings taken by the early fathers of copper-plate printing for testing the state of their work. See ENGRAVING. Consult Wilson, H., 'Silver-work and Jewellery' (London 1912).

NIEMANN, nē-män, **Albert**, German operatic tenor: b. Erxleben, near Magdeburg, 15 Jan.

1831. At first a worker in a machine factory, he became an actor in 1849; was trained in singing by Schneider, hofkapellmeister at Dessau, and by Nusch, a baritone; appeared at Berlin, Stuttgart and Königsberg; and after further study under Duprez at Paris, played in the first production of *Tannhäuser* in that city (1861), was made "kammersänger" to the emperor and attained great success throughout Germany. From 1866 until his retirement in 1889 he was connected with the court opera of Berlin, where he was distinguished in heroic rôles. Wagner selected him to impersonate Siegmund in 'Die Walküre' at Bayreuth in 1876. He appeared with success in the United States in 1887-88. Consult Sternfeld, 'Albert Niemann' (1904).

NIEMCEWICZ, nyēm-tsā'vich, **Julian Ursin**, Polish statesman and author: b. Skoki, Lithuania, 1757; d. Paris, 21 April 1841. After graduating from a military school, he entered the army in 1777 and became major in 1788. In that year he was sent as a deputy to the Polish Diet where he defended the rights of the middle and peasant classes. He was a publisher of the *People's Paper* and framed the "Constitution of the Third of May" (1791), which made monarchy hereditary in Poland. He acted as adviser and adjutant to Kosciuszko and was taken prisoner with him at the fatal battle of Maciejowice (1794) and shared his captivity in Petrograd. On his release he traveled in the United States, where he married Mrs. Livingston Kean of New York. When he heard of Napoleon's entrance into Poland in 1807 he returned to his native land. After the Congress of Vienna he was made Secretary of State and President of the Constitutional Committee in Poland; and when Poland came under Russian control he was retained in office. The events of 1830 drove him again into exile and he went to Paris, where he died. Niemcewicz wrote in many styles. His 'Historical Songs of the Poles' (Warsaw 1816), a series of ballads describing the chief heroes of Poland's golden age of Sigismund I and the reigns of Stephen Bathori and Sobieski, are greatly beloved by the Poles and did much to arouse their national consciousness. His comedy, 'The Return of the Deputy' (1790) was popular also and his novel, 'John of Tenczyn' (1825), much in the style of Walter Scott gives a fine picture of old Polish days. He also wrote a 'History of the Reign of Sigismund III' (3 vols., 1819); and a 'Collection of Memoirs on Ancient Poland' (6 vols., 1822-23). A collection of his works was published in 12 volumes (Leipzig 1838-40), but it is not complete. Consult Czartorewski, 'Life of Niemcewicz' (in Polish, Paris 1860); Pamientniki, 'Memoirs' (1876, 1877, 1912) and Niemcewicz, 'Lithuanian Letters' (1812).

NIEMEN, nē'mēn or nyēm'ēn, a river of Prussia, with 70 miles, the lower part of its course of 500 miles, lying within the province of East Prussia, where it is called the Meml. It rises a few miles south of the city of Minsk. It is navigable to Grodno; below Tilsit it divides into two branches, which reach the Kurisches Haff each by four mouths and is almost cut off from the sea by narrow spits of sand.

NIEMEYER, nē-mi-ēr, **Felix von**, German physician, grandson of the poet and theologian Felix August Hermann Niemeyer: b. Magde-

burg, 31 Dec. 1820; d. Tübingen, 14 March 1871. He was educated at Halle; practised in Madgeburg 1844-55; was professor of pathology and therapeutics at Greifswald, and from 1860 at Tübingen; was military surgeon during the Franco-Prussian War; was ennobled for his services to the king of Württemberg; and wrote a 'Textbook of Special Pathology and Therapeutics, (1858), often republished and distinctly valuable.

NIEPCE, Joseph Nicéphore, zhō-zéf nē-sā-fôr nē-ēps, French inventor: b. Châlon-sur-Saône, 7 March 1765; d. Gras, near Châlon, July 1833. He served in the French Revolutionary army, was administrator of the district of Nice 1795-1801, then devoted himself to chemical and mechanical studies at Châlon, and from 1811 to lithography. His researches in photography began in 1813, and by 1824 he was successful in obtaining permanent impressions of the images of the *camera obscura*. In 1826 he joined Daguerre in a further prosecution of the investigations. An article of their agreement seems to make it clear that the real credit for the discovery of photography belongs to Niepce, and that Daguerre was merely an important and in its development. Consult Fouqué, 'La vérité sur l'invention de la photographie' (1867); and the 'Life' by Davanne (1885). See also DAGUERRE; PHOTOGRAPHY.

NIETZSCHE, nēt'shē, Friedrich Wilhelm, German philosopher: b. Röcken, 15 Oct. 1844; d. Weimar, 25 Aug. 1900. He studied philology at Bonn and Leipzig, and held the professorship of classical philology at Bâle from 1869 to 1879. The next 10 years were spent at different health resorts. In 1889 he became insane and died at Weimar in 1900. His most important writings are 'Die Geburt der Tragödie' (1872); 'Unzeitgemässe Betrachtungen' (1873-76); 'Menschliches alzu Menschliches' (1878); 'Also sprach Zarathustra' (1883-92); 'Jenseits von Gut und Böse' (1886); 'Zur Genealogie der Moral' (1887); 'Der Wille zur Macht' (1895).

Nietzsche's theories may conveniently be divided into three periods; the first, which may be called the æsthetic period, extending until 1878; the second, the intellectual or positivistic period, until about 1883, and the third, or ethical, until 1889. The relation between these periods has been much discussed, and many critics have denied the existence of any unifying principle. It must be remembered that his writings are the brilliant but nevertheless incoherent revolt of a doomed mind against its malady. On the other hand, the whole of Nietzsche's philosophy often seems an attempt to answer the question as to the nature of the chief good, and the chief radical differences in the three periods may be explained as due to changes in his standard of valuation.

(1) During this period Nietzsche accepted Schopenhauer's general standpoint, especially his emphasis upon the priority of will to intellect, and his pessimism, but regarded the latter as resulting in increased artistic activity rather than in question. The ultimate values are those of the artist, and the two great forces in art are typified by the Greek gods, Apollo and Dionysus. The former is the dream, which, conscious of its own illusion, mirrors appear-

ances. The latter is the intoxication that marks the breaking forth of the underlying reality. The hope of modern art lies in the union of the two in the Wagnerian opera, an estimate of Wagner later to be contradicted.

(2) With the beginning of the intellectual period, a logical rather than an æsthetic value is made supreme.

(3) The third period is by far the most important, since it contains the most characteristic and original of Nietzsche's views; and here the ultimate value is one of conduct rather than of thought or feeling. The basal reality is the will for power, a metaphysical principle which is extended from human activity to the universe, but which as such receives only vague treatment. The ethics is both negative and positive, in that it consists, first, of a criticism of existing moral distinctions, and, second, of the exposition and defense of a new moral ideal. Historically there are two moralities, each with its own set of opposites. Good and evil, the first pair, are valuations of the ruling classes, for whom everything that expresses or furthers the will of the individual is good. All that he does or likes, his passions, his ideals, all that forms a part of himself is good; while whatever is different is evil. The other pair of valuations, good and bad, belongs, on the contrary, to the slaves, and here whatever characterizes the ruler and so is inconvenient or painful to the subject is stigmatized as bad, while good is applied to all those qualities and actions that make life easier. It is essentially the morality of suppressed resentment; and whereas the seal of aristocratic approval is set upon the positive traits of the healthy animal, such as courage, self-assertion and desire for unrestrained freedom, to the slave good means meekness, sympathy and obedience. The present European standards are those of the slaves, and Nietzsche even affirms that they have become such largely through a deliberate plot of the Jews, at the beginning of the Christian era, to revenge themselves upon their Aryan conquerors by foisting upon them an ignoble standard of worth.

The aristocratic moral ideal that Nietzsche would substitute for this one takes self-assertion as its most essential characteristic. At the bottom of everything is the will for power; and all that makes for fullness of life is to be cherished, even though it overrides all our ideas of morality and of religion. The so-called virtues of pity, humility and the like are merely symptoms of weakness and degeneracy. Strength and pride, ruthlessness toward oneself and toward others, courage and love of battle, all mark the true man, who has put behind him prejudice and tradition. For such complete affirmation of life opposition is a necessity, and a good war sanctifies every cause. The impulses should be given full play, not weakened by despicable self-denial. Altruism is an offense against delicacy, and pain alone can bring about the proud isolation that is above all pettiness. Such a view of the chief good is by no means to be called hedonistic. There is doubtless a fierce joy in battle and in all sorts of conflict; but the end proposed and reached is not happiness. Power and power alone is the good.

The two doctrines most often associated with Nietzsche's name, though they are not essential to his ethics, are those of the Superman and the

Eternal Recurrence. The first is the end and justification of human struggle, and in the earlier books is represented as a mystical product of the individual will, while later it is described as a higher species with the relationship to man that man has to the ape. The Eternal Recurrence is the theory, by no means new, that present events but form a part of an infinite cycle and thus will be endlessly repeated in every detail. The final test of Nietzsche's aristocrat is his willingness to accept such repetition even of the hardest conditions. The whole attitude toward life evidently makes the pessimism of the first period no longer possible; and the new standpoint is characterized by its author as tragic optimism, namely, the view that finds life worth while not in spite of but because of its pain. Nietzsche's theories have been much discussed and have exercised an unexpected influence, especially among men interested primarily in art or in social reform; and many consider them the logical outcome and application of Darwinism, but there is nothing in Darwinism itself, apart from all preconceived philosophical interpretations, which compels a Nietzschean ethics.

GRACE NEAL DOLSON,

Professor of Philosophy, Wells College, Author of 'The Philosophy of Nietzsche.'

NIEUPORT, nē'oo-pôr, Belgium, town in the province of West Flanders, on the Yser River, 10 miles southwest of Ostend. It was a strongly fortified town in the Middle Ages. A castle was erected here in the 9th century by the Flemish counts for protection against the Normans. Of this castle only the donjon tower remains. In 1160 the name was changed from Santhoven to Neoportus. The siege of Nieuport by the French in 1488-89 is the chief episode of its heroic period. Here, too, Maurice of Nassau defeated in 1600 the Spaniards under the Archduke Albert in the famous battle of the Dunes. The old buildings are highly interesting: the Cloth Market dates from 1480; there is an old Gothic church (restored in 1903); and a town-hall containing a small collection of paintings.

The lighthouse dates from 1289. Two miles from the town is the modern seaside resort, Nieuport Bains, which although dating

from only 1869 is very popular for visitors on account of the fine bathing. The pier extends 1,500 yards into the sea at the entrance of the Yser which has been canalized. The industries of Nieuport are shipbuilding, rope and net-making and fishing. Pop. (1904) 3,780.

During the European War Nieuport was the scene of almost continuous fighting. The famous Nieuport-Dixmude line offered the greatest resistance to the German drives for Calais. Trench warfare was almost incessant at Nieuport during the first year of the war.

NIEUWENHUIS, Ferdinand Domela, Dutch Socialist; b. Amsterdam, 1846. He was educated at the Lutheran Seminary in Amsterdam and was pastor of churches in Harlingen, Beverwijk and The Hague. In 1879 he became leader of the Social Democrats, which he had founded, and in 1887 he was elected to the States-General. Growing more extreme in his views he formed, with Cornelissen, a free Socialist faction. He took a prominent part in the Socialist congresses of Brussels (1891) and Zürich (1893), opposing Liebknecht and compulsory military service. In 1897 he started a new journal, *De veye Socialist*. Nieuwenhuis is the author of 'Schetsen en tafereelen uit de Fransche revolutie van 1789' (1889); 'Die geschiedenis van het socialisme' (3 vols., 1901-02); 'Hoc ons land geregeerd wordt op papieren in de werkelijk held' (The Hague 1891; 4th ed.); 'De welenschap en het Karakter' (The Hague 1892) and many other books and pamphlets on political subjects. He has also written on religion and published a book on the Bible, 'De Bijbel' (Amsterdam 1893).

NIEVO, Ippolito, Italian poet: b. Padua, 1832; d. by shipwreck near Tirreno, 4 March 1861. He was educated in Padua, Verona and Mantua; joined the army; took part in the revolution under Garibaldi and became a colonel. His works, which show the development of the Italian national consciousness from 1775 to 1850, are ranked high in Italy. They comprise historical novels, stories, dramas and poems. Nievo has much wit and a picturesque manner of expression. He passed from romanticism to realism. He is regarded as the founder of the realistic school in Italy. His works include 'Angelo di bonta' (1856); 'Conte pecoraio' (1857); three collections of tales; 'Confessioni d'un ottuagenario' (1867), posthumously published; and the unfinished 'Il pescatore di anime.' His portrait appears in 'Nuova Enciclopedia Italiana' (Boccardo, Vol. XV, p. 429, Turin 1883). Consult Mantovini, D., 'Il poeta soldato, Ippolito Nievo' (Milan 1900); Molmenti, P. G., 'Ippolito Nievo, cenni critico-biografici' (Venice 1869); and Croce, I. Nievo' (in *La Critica*, November 1912).

NIEVRE, nē-āv'r, France, a central department, bounded by Yonne, Cher, Allier, Saône-et-Loire and Côte-d'Or; area, 2,658 square miles; capital, Nevers. The soil is generally rocky and sandy, cut up by ramifications, almost always wooded, of the mountains of Morvan, forming the watershed between the Rhône and the Seine. There are several plateaux more or less fertile, a number of hills covered with vines and valleys productive in pastures; but the principal wealth consists in forests and minerals. The Nièvre, whence the name of the department, is an inconsiderable affluent of the

Loire from the right. The three chief rivers — the Allier, Lorie and Yonne — are navigable, and the Yonne, which belongs to the system of the Seine, is connected with the Loire by a canal across the watershed, and there is also the Nivernais Canal. Oats and wheat are the chief cereals. More than a third of the whole surface is covered with forests, the timber from which, forming one of the principal sources of wealth, is conveyed by water in great quantities to Paris, etc. Its wines are important. Minerals include iron and coal, and the chief manufacturing products are woolen cloths, linen, glass, porcelain, cutlery, etc. Pop. 299,312.

NIFLHEIM, nif'him, in Scandinavian mythology, the region of endless cold and everlasting night, ruled over by Hela. It is separated from Muspelsheim, the kingdom of light and heat, by a huge chasm (Ginnungagap, yawning gap). Here flows the spring Hvergelmir, watched by the dragon Nidhugger; this spring sends out 12 ice-rivers, from the drops of which, thawed by sparks from Muspelsheim, sprang the chaotic giant, Ymir, and the cow, Audhumbla.

NIFO, né'fō, Agostino, Italian philosopher: b. Giapoli, Calabria, Sicily, about 1473; d. Sissa, 18 June 1538. Three cities claim to be his birthplace: Giapoli, near Calabria, Sicily; Tropea, near Abruzzi; and Sessa, near Tierra di Lavoro. The latter Nifo recognized as his natal town. He lived in Sezga, studied philosophy in Padua and lectured in Padua, Naples, Rome and Pisa, attracting the attention of Leo X, who had him defend the Catholic doctrine of immortality against the attack of Pomponazio and the Alexandrists. In this famous controversy he opposed Pomponazio's theory that the rational soul is inseparably bound up with the material part of the individual and insisted that the individual soul is indestructible (being a part of absolute intellect) and on the death of the body is merged into eternal unity. As a reward for his splendid argument he was made Count Palatine with the right to call himself by the name of Medici. In 1495 he published an edition of the works of Averroes with a commentary presenting the views of the orthodox Catholics. His commentaries on Aristotle were widely read and frequently reprinted. The most famous edition appeared in 14 volumes, including the 'Opuscula' (Paris 1654). His own philosophical works are 'De immortalitate animi' (Venice 1524); 'De intellectu et daemonibus'; 'De infinitate primi motoris quæsto' and 'Opuscula moralia et politica.'

NIGEL, nig'el, English satirist of the close of the 12th century, sometimes called WIREKER. A monk at Christ Church priory, Canterbury, he wrote various verse, the most important of his poems being the 'Speculum Stultorum,' in which, as in the prose work 'Contra Curiales et Officiales Clericos,' he boldly attacked the vices of his fellow-ecclesiastics. The 'Speculum Stultorum' or 'Mirror of Fools,' with its story of the ass, Burnellus, who wished his tail was longer, for centuries enjoyed great popularity. Consult Wright, 'Anglo-Saxon Satirical Poets' (1874).

NIGELLA, a genus of plants of natural order *Rumunculaceæ*, having five colored spread-

ing sepals; 5 or 10 small two-lipped petals, with tubular claw; the carpels more or less connected together, many-seeded; leaves divided into threadlike segments, flowers, solitary at the top of stem or branches. They are annuals, natives chiefly of the countries near the Mediterranean and warmer temperate parts of Asia. Some, occasionally seen in gardens in Britain, are vulgarly known by the names *Devil-in-a-bush* and *Devil-in-a-mist*. The seeds are aromatic and somewhat peppery. Those of *N. sativa*, species common in cornfields in southern Europe, are supposed to be the *black cummin* of the ancients, perhaps the *cummin* of the Bible. The seeds of a specie of *Nigella* are much used by the Afghans for flavoring curries.

NIGER, ni'jēr, or **JOLIBA**, jöl'i-ba, a river of West Africa, the third in size of the African continent, known by various native names throughout its course, being the Joliba in its upper reach, the Mayo Balleo and Isa Eghirren in the central reach and the Kwarra or Quorra in its lowest reach. The upper and central reaches are politically controlled by France and the lower reach, through Northern and Southern Nigeria, by Great Britain. The Niger rises on the eastern slope of Mount Yenkina on the boundaries of Sierra Leone and Liberia, about 175 miles from the west coast, its headwaters being contiguous to those of the Senegal which flow in an opposite course. It flows northeast as far as Timbuktu, 300 miles above which it is joined by the Bani, a large tributary, and splits up into numerous diverging channels and lakes. After passing Timbuktu it flows east for 200 miles, then turns southeast through a rocky country past Say. At about 11° 40' N., just above Ilo, it enters British North Nigeria, at Giri being joined by the Sokoto River from the east. At Boussa navigation is impeded by dangerous rapids. Finally, after a long southwestern curve to Bida, it bends more to the south and is joined by a tributary of first-class size, the Benue, or Mother of Waters, a rival in volume which has come from a source 860 miles to the east. The united stream now "passes through a series of bold picturesque hills by a narrow gorge," and eventually breaks up into one of the most remarkable mangrove-covered deltas of the world. This delta, malarious and unhealthy, covers an area of about 14,000 square miles, completely intersected by branches of the river, the principal of which, the Nun, runs through the middle of the delta. The westernmost branch, the Benue, has a bar, which presents a great difficulty to navigation. Other mouths or branches are the Bonny, New Calabar, Brass and Forcados (which has now taken the place of the Nun as the principal navigable mouth), distributing the Niger's waters into the bights of Benin and Biafra in the Gulf of Guinea. In its course the Niger passes through much fertile valley lands, and there are valuable lignite deposits east and west of the river, while numerous towns and villages stand on its banks, and a considerable canoe commerce is prosecuted. Slaves were formerly nearly the only article of export from the Niger, but palm oil is now the principal staple, the delta outlets being known as oil rivers. The whole course of the river is about 2,500 miles, and the area of its basin is estimated at 584,000 square miles. By means of the Niger-Benue system direct access is had at

the height of the season with Nafoda, 200 miles from Lake Tchad, and 900 miles from the sea. Mungo Park was the first European traveler to explore any part of this river (1796-97) and was drowned in the Boussa rapids. The honors of modern exploration are divided between French, British and German travelers. Consult Bindloss, 'In the Niger Country' (London 1898); Hourst, 'Exploration of the Niger' (Eng. trans., ib. 1898); Leonard, A. G., 'The Lower Niger and its Tributaries' (ib. 1906); Mockler-Ferryman, 'Up the Niger' (ib. 1892).

NIGER, Military Territory of the, a subdivision of French West Africa, situated in the Upper Senegal-Niger colony (formed in 1904 from the Senegambia and Niger territories). The territory lies north of the British Protectorate of Nigeria and directly west of Upper Senegal-Niger.

At the same time that the colony of Upper Senegal-Niger was formed the military territories, which now form an integral part of it, were broken up. The second military territory (which included nearly all the country within the Bend) was handed over to the civil administration. The first (Timbuktu) has been incorporated in Upper Senegal-Niger, and is administered by a colonel under the authority of the lieutenant-governor. The third (Zinder-Chad) territory has been constituted an autonomous unit. The capital is Bakmako (pop. 1918, 8,734). The most important cities are Kayes (pop. 5,820), and Timbuktu (4,270). At Bamako is a professional school and a school for the sons of chiefs. At Timbuktu there is a Mussulman Superior School with 67 pupils and one official. The natives cultivate peanuts, millet, maize, rice and cotton. Rubber and *Kariti* are other products. Cattle abound. Native industries include pottery, brick making, jewelry, weaving and leather-work. The chief imports are cotton, foodstuffs and metal-work. The chief exports are peanuts, cattle, rubber, skins and wool. There is a complete system of telegraph from Kayes to Naimey and from Zinder to Lake Tchad. The Senegal-Niger Railway runs from Kayes to Koulikoro, a distance of 349 miles. Small steamboats run from Koulikoro to Timbuktu, so that it is now possible to perform the entire journey from Europe to Timbuktu by rail and boat. A wireless telegraph connects Timbuktu with the Eiffel Tower in Paris. See UPPER SENEGAL-NIGER; TIMBUKTU; FRENCH WEST AFRICA.

NIGERIA, nī-jě'rī-a, or **NIGER** (nī'jēr) **TERRITORIES**, West Africa, an extensive British colonial possession on the lower Niger, organized since 1900, within the boundaries arranged by the Anglo-German Agreements of 1885, 1886 and 1893, and the Anglo-French Agreements of 1889, 1890 and 1898. It comprises the Lagos Protectorate and Southern and Northern Nigeria, being bounded on the east by German Kamerun, and on the west and north by Dahomey and the French military territories.

Nigeria includes the whole course of the Niger from a short distance above Ilo to its mouth, and also the left bank for a few miles higher up. The northern boundary runs irregularly eastward to a point on Lake Tchad. Nigeria also includes the whole course of the

Benue from a point above Yola to its confluence with the Niger at Lokoja. The coast-line extends from the Rio del Rey on the east, to near the mouth of the Benue River on the west, and thus includes all the mouths of the Niger. The total area is about 336,000 square miles; the mixed negro population may amount to 17,000,000, chief of which are the Fulah or Fulani of the Hausa states. Mohammedanism is widely diffused. For administrative purposes the territory is divided into Northern and Southern Nigeria, the boundary line being drawn due east from Owo, on the Lagos frontier. The country is mainly a level or rolling plateau, but in the central districts there are mountain ranges and isolated peaks, many of them forest-clad, of considerable elevation. The Niger and the Benue are the chief rivers, the latter being especially valuable for navigation. The Gulbin-Sokoto is a perennial left-bank tributary of the Niger, and the Waube, flowing into Lake Tchad, is also of some importance. The climate is tropical, with a dry (October-May) and a wet season. During the latter the rains are often extremely heavy and accompanied by severe thunder-storms. The mean annual temperature is about 80° F., but at some periods of the year the temperature in the shade may exceed 100°. The delta lands are unhealthy, and the same may be said of much of the interior, but the climate of the elevated districts is generally quite suited to Europeans. Geologically, the region is formed mainly of granite and various metamorphic rocks, but sedimentary formations, chiefly sandstones and almost entirely belonging to the older periods, are also found. Silver, tin, antimony, lead, iron and other minerals occur. Among the vegetable and agricultural products, most of which are exported, are cotton, indigo, palm-oil, palm kernels, ground-nuts, india-rubber, ebony, camwood, gums and coffee. Ivory and hides are also important exports, and among the native industries leather-working deserves mention. There are great tin deposits covering 9,000 square miles. There is direct railway communication between Lagos and Kano (712 miles), and other lines. The chief towns of Southern Nigeria are Asaba, Onicha, Akassa, Idda, Wari, Burutu, Brass, New Calabar, Bonny Opobo and Old Calabar, all ports with custom-houses; Ado and Benin. The chief towns of Northern Nigeria, which consists mainly of the former Sokoto empire and the larger part of Bornu, are Lokoja, at the confluence of the Niger and Benue, Kano, Sokoto, Gando, Ilorin, Yakoba, Kuka, Yola, Ilo and Katsena.

The greater part of Nigeria was administered by the Royal Niger Company till 1 Jan. 1900, when it was bought out by the British government and the two protectorates of Northern and Southern Nigeria formed. This company was formed in 1882 as the National African Company, and four years later it received its royal charter. Most of what is now Southern Nigeria was not under the rule of the company, but formed from 1884 till 1893 the Oil Rivers Protectorate, and from 1893 till 1899 the Niger Coast Protectorate. The kingdom of Benin was incorporated in the Niger Coast Protectorate in 1897.

In 1906 the colony and protectorate of Lagos was incorporated with Southern Nigeria; and in 1914 Northern and Southern Nigeria were

amalgamated under a governor-general. Lagos is the present seat of government; but it is intended to remove the capital to Kaduna, in the heart of the country.

Lander, Richardson and Rohlf, Bindloss, 'In the Niger Country' (1899); Falconer, 'On Horseback through Nigeria' (1911); Leonard, 'The Lower Niger and Its Tribes' (1906); Lucas, 'Historical Geography of British Colonies: West Africa' (1913); Morel, 'Nigeria: Its Problems and Its People' (1911); Orr, 'The Making of Northern Nigeria' (1911); Raphael, 'Through Unknown Nigeria' (1914); Schultze, 'The Sultanate of Bornu' (Eng. trans., 1914), and a recent work by a former lieutenant-governor of Northern Nigeria, Temple, C. L., 'Native Races and their Rulers' (Cape Town 1918).

NIGGER CHUB, or **NIGGER DICK**, a dark-green chub (q.v.) of the Mississippi Valley, distinguished by the three-lobed condition of the under jaw. See **CUTLIPS**.

NIGGER TOES. See **BRAZIL NUT**.

NIGGERFISH, a name given to the seabass of the genus *Bodiamus*, common in the waters of Bermuda and Florida. The Spanish name for it is *guatavere*. Consult Harris, William C., and Bean, Tarleton H., 'The Basses: Fresh-water and Marine' (illustrated by Louis Rhead, New York 1905).

NIGHT. (1) See **DAY**. (2) In Greek mythology, Night (Nyx) was personified as a powerful goddess, who by means of sleep exercised power over men and gods. She was the daughter of Chaos, wife of Erebus, and mother of Æther and Hemera (Day), of the Fates, Sleep, Death, Dreams, Hunger, Fear, Nemesis and Strife. By day she dwelt in Tartarus enveloped in thick clouds.

NIGHT-APE. See **DOUROUCOULI**.

NIGHT-BLINDNESS, a defect of vision. See **VISION**, **DEFECTS OF**.

NIGHT BLOOMING CEREUS, the name given to the superb variety of night-flowering cactus, the *cereus grandiflorus*, with its vanilla-scented flowers. See **CEREUS** and **CACTUS**.

NIGHT-HAWK, or **BULL-BAT**, an American nightjar or goat sucker (*Chordeiles virginianus*). It arrives in the Northern States about the middle of May and is crepuscular and nocturnal in habits, pursuing insects on the wing with great activity and often at a great height in the air, frequently over towns and cities. It retires in the daylight hours to the woods or an orchard and sleeps sitting lengthwise on some large horizontal limb, or on a log, where its grayish mottled plumage, blending with the color of the old bark, makes it unnoticeable. When flying it often utters a harsh scream, and also, when dropping suddenly through the air, as it often does, it produces a strange booming sound. The night-hawk attains a length of 9 or 10 inches. It is blackish-brown on the upper parts, barred and mottled with grayish and buffy; a large wing-spot, bar across the tail, and V-shaped blotch on the throat, are white in both sexes and is the easiest mark of recognition. The tail is forked and is a little shorter than the wings when in repose. The gape is large and the rectal bristles are inconspicuous.

The eggs, two in number, oblong shape, and dirty bluish-white sprinkled with dark olive-brown, are produced about the middle of May, and are deposited on the bare ground in a dry situation, no nest being constructed. In Texas, Mexico and the Antilles there exists an allied species (*C. acutipennis*).

NIGHT-HERON. See **HERONS**.

NIGHT SCHOOLS. See **EVENING SCHOOLS**.

NIGHT THOUGHTS, or **THE COMPLAINT**. The first book of the 'Night Thoughts' appeared in 1741, when Young had just completed his 60th year; the ninth and last book was published four years later. The professed purpose of the whole poem is to recommend the faith in another life as a compensation for the sorrows, disappointments and hollowness of this one. Young is careful to tell us in the preface to the first night that "the occasion of the poem was real, not fictitious"; and doubtless the reflections in the first two books were largely suggested by personal bereavement. His wife died early in 1741; two other friends, a daughter of his wife by a former marriage and her husband, to both of whom Young was warmly attached, had died, one in 1735 and the other in 1740.

"Insatiate archer, would not one suffice!"

cries the poet in a burst of genuine grief. But grief that is really poignant is not usually quite so rhetorical; one does not need to read far even in the early parts of the poem to suspect that the poet was not wounded so much in his affections as in his ambitions. Did we know nothing of Young's career, we might safely conjecture that this is the complaint of a man who, at the summit of his years, turns away from life disappointed, with the pious resolve to disown and discredit the things he had most desired. After the close of the third Night this tone of melancholy reflection changes to one of declamatory argument. Young had the typical 18th century confidence in "reason" and used the last six Nights of the poem mostly in the attempt to "reclaim" a certain Lorenzo, who is supposed to be a representative of the prevalent deism of Young's time. But Lorenzo is a man of straw; and Young's familiar arguments, whatever their intrinsic value, are lost in such a wilderness of wordy metaphor that the reader of to-day is inclined to sympathize with Lorenzo and emerges at the end of 10,000 lines dazed and wearied rather than convinced.

In fact, Young's poem exhibits about all the dangers that best the extravagant rhetorician. His imagination is at times genuinely lofty; yet he is always mistaking bigness for greatness. With a flux of metaphor, apostrophe and hyperbole at command, he is always forgetting that the most sublime and the most pathetic truths admit only the simplest statement. If he occasionally writes a line of epigrammatic brevity and force, like

"Procrastination is the thief of time".

or

"An undevout astronomer is mad",

he is sure to submerge his fine line in a rubbish of feeble metaphor. Worst of all, such a continuous roll of tumid declamation, in exclamations and superlatives, forces us to doubt the poet's sincerity. Lacking in spontaneous feel-

ing, he deems it his duty to force his emotions by violent rhetorical stimulants. As he says, "On such a theme as this, 'tis impious to be calm".

But emotion thus excited is likely to leave the reader's sceptical calm quite undisturbed.

Yet it must be remembered that in his own day Young enjoyed a reputation hardly inferior to that of Pope. The 'Night Thoughts' was deemed the greatest moral poem of the century, admired equally for its art and its religion. For some 40 years probably no other poem in England was more widely read. The fame of it quickly spread to Germany, where no fewer than three different translations were made in the decade from 1750 to 1760. In France also it was hardly less admired.

Explanation of this popularity is found partly in some unquestioned merits of Young's work—in the sustained amplitude of its blank verse, thought by many superior to Milton's; in the exhaustless, if unregulated, store of its imagery; in occasional passages of subtle thought or lofty emotion. But the most important cause of this contemporary estimate of Young's poem is in its appeal to a temper of unrest and dissatisfaction then almost universal in Europe, a temper which took different forms in different countries, but everywhere was inclined to welcome a literature of morbid, sentimental melancholy. It is noticeable that the one prose work more widely read in England than any other for some 30 years, Hervey's 'Meditations among the Tombs,' was an exact contemporary of 'The Night Thoughts,' and was filled with the same tumid rhetoric. Blair's 'Grave' (1743), a poem of some thousand lines of blank verse, is another example of what has been called the Graveyard School of literature. The temper which enjoyed such literature was one of the many forms of reaction against convention in religion and society as well as in art, which issued later in romanticism in literature, and in revolution in society. With the growth of a more healthy and vigorous tone of feeling, the interest in this morbid, sentimental work largely passed away; it is safe to say that 'The Night Thoughts' has found few readers in the last hundred years. Consult Courthope's 'History of English Poetry' (Vol. V); Eliot, George, 'Essays'—"Worldliness and Other Worldliness"; Kind, J. L., 'Edward Young in Germany' (Columbia University Press).

CALEB T. WINCHESTER.

NIGHTINGALE, Florence, English philanthropist; b. Florence, 12 May 1820; d. London, 13 Aug. 1910. She early became interested in hospital work, was trained as a nurse and studied the methods of hospital administration through Europe. In 1853 she established a hospital for invalid gentlewomen in London. The early stages of the Crimean War (1854-55) disclosed a terrible state of affairs in regard to the treatment of the wounded. The hospital arrangements were inadequate and unorganized; the usual satellites of warfare—fever, cholera and dysentery—were doing their deadly work among the wounded and healthy alike. Public indignation was aroused, and the government called on Miss Nightingale. It was a remarkable coincidence that, while the Minister for War, Sydney Herbert, was writing asking her to undertake the onerous task of organizing the hospitals, the lady

was also writing to him, offering her services, her experience and, if necessary, her life itself. In a week she raised a band of trained nurses and proceeded with them to the Turkish military hospital at Scutari on the Bosphorus, arriving on 4 Nov. 1854. She took command of the hospital, introduced system and order where indescribable chaos had reigned, and laid the foundations of modern scientific nursing. She made three trips across the Black Sea to the Crimea and reorganized the base hospitals and dressing stations. Here she was attacked with fever; a special yacht carried her back to Scutari. On her recovery she resumed her post and continued her devoted labors till the end of the war. In recognition of her services a fund of £50,000 (\$250,000) was raised for her. She refused to accept the money for herself but devoted it to found the Nightingale Home at Saint Thomas' Hospital. She received the thanks of Parliament and was frequently consulted by royal commissions in regard to field and camp hospitals. Her advice was sought by the American government during the Civil War and by the French in the Franco-Prussian War of 1870-71. Numerous honors were conferred on her; she received the rare distinction of the Order of Merit in 1907 and the freedom of the city of London in 1908. Among her writings are 'Notes on Hospitals' (1859); 'Notes on Nursing' (1860); 'Lying-In Institutions' (1871) and 'Life or Death in India' (1874). She is commemorated in the new statuary group of the Crimean War Monument in London and the Nightingale statue in Waterloo Place. Longfellow's 'Santa Filomena' was written in her honor, since when she became known as 'The Lady with a Lamp.' Consult the authoritative 'Life' by E. T. Cook (London 1913) and biographies by Matheson, A. (1913); Richards (1909) and Miss Tooley (1905); Kinglake's 'Invasion of the Crimea.'

NIGHTINGALE, a celebrated song-bird of the family *Sylvidae* or Warblers. The nightingale (*Daulias lusciniæ* or *Luscinia megarhyncha*) is attractive for no lustre or brilliancy of plumage, the upper parts of the body being rusty-brown tinged with olive, and the under parts pale ash, blending into white at the throat and belly. Its average length is about six inches. In habits the nightingale is active and lively; it frequents trees of small size and bushes, and subsists chiefly upon an insectivorous dietary. It is a migratory bird, and occurs throughout Europe, but in Great Britain is limited to certain districts, so that it is never or rarely heard in Wales nor in the most western districts of England, nor in Ireland or Scotland. The song continues from 15 April until the middle of June, when the young are hatched. The male bird sings during the day, and at night also and perhaps more frequently, while the female is incubating; and the flood of song poured forth in the stillness of the evening forms one of the chief sources from which the reputation of the nightingale has been derived. The nest is of rough construction. It is generally formed of leaves and grasses, and is situated mostly in damp places or in the neighborhood of water. The eggs number from four to five, and are of an olive-green color. These birds live in confine-

ment. The bird-catchers, if possible, take the males before the arrival of the females. Birds trapped after the pairing season are said to languish and die. Another species, formerly regarded as identical with the above, is *D. philomela*, which has a more easterly distribution, extending far into western Asia. This is the bird most often referred to in literature as the Persian bulbul; and it takes a prominent place in classic mythology as does a third species, *Luscinia hafizi*, in Persia and Turkestan. Nightingales endure captivity well and are kept as cage-birds in all parts of the world. See CAGE-BIRDS and the authorities there mentioned; consult also Burroughs, 'Winter Sunshine' (Boston 1876; autograph ed., ib. 1904); Newton, Alfred, 'Dictionary of Birds' (London 1896); Kirkman (ed.), 'The British Bird Book' (London 1911), and the writings of British ornithologists.

NIGHTJAR, a bird of the family *Caprimulgidae* (q.v.). This name was first given to a single species, that common in the British Islands, on account of the jarring note it utters after dark; but most of the members of this nocturnal family produce similar sounds, and the term seems preferable in many respects to the erroneous designation "goatsuckers" traditionally applied to them in southern Europe and which should long ago have been abandoned. American representatives are the night-hawks, whippoorwills and chuck-will's-widow, elsewhere described. The British nightjar is much like the American whippoorwill in appearance, and is known by many provincial names, such as dor-hawk, churr-owl, fern-owl, etc. Consult Montagu, 'Dictionary of British Birds'; Newton, Alfred, 'Dictionary of Birds' (London 1896); White, 'Natural History of Selborne.'

NIGHTMARE, a sensation of oppression or of suffocation which sometimes occurs during sleep. The sufferer experiences a short period of intense anxiety, fear, horror, etc.; feels what seems an enormous weight on his breast; is pursued by a phantom, monster or wild beast, which he cannot escape; is on the brink of a precipice from which he cannot remove, or is, perhaps, rolling down it without being able to make any exertion for his safety; and his bodily members refuse to do their office, until he suddenly awakens himself by starting up, or by a loud cry; he is then in great terror, and the body may be covered with sweat. Nightmare is generally due to repletion and indigestion, and is often superinduced by lying on the back, especially when the head is low. A person subject to nightmare should carefully observe moderation in eating and drinking, should avoid heavy meals shortly before retiring and likewise overrich food. Alcoholic excess may lead to nervous disorders characterized by conditions, physical and psychical, which increase liability to nightmare and similar forms of disturbance. See DELIRIUM; INCUBUS; MARA.

NIGHTMARE ABBEY, a novel by Thomas Love Peacock, the hero of which is a caricature of Shelley. It was published in 1818.

NIGHT'S LODGING, A. (Na dnve). Gorki wrote his drama 'Na dnve' ('At the Bottom') in 1902. It was translated into German

as 'Ein Nachtsylx' ('A Night's Lodging'), and is known by this title in English. It gained its reputation because Max Reinhardt introduced it at the Little Theatre in Berlin, after it had been acclaimed as a masterpiece in Moscow on 31 Dec. 1902. There is no action and the plot is insignificant. A poor, maltreated woman dies in the purlieu. Vaska, the thief, rejects the landlady and keeps company with her kindlier sister. During a brawl the land-lord is killed, and the widow denounces her past lover to the police. The redeeming character is a pilgrim whose quaint philosophy seems to keep aflame the spark of humanity in the creatures of the purlieu. When he leaves, all return to their sordid lives, and one of them, a former actor, hangs himself. The characters are described with gross fidelity to nature, and it is only the artistry of the Moscow Art Theatre and of Reinhardt's troupe that made the production possible. In the hands of less gifted players the drama is intolerable.

LEO WIENER.

NIGHTSHADE, any of several plants of the order *Solanaceae*, sometimes called nightshade family, especially distinguished for toxic properties, and constituting the typical genus *Solanum*. The common or black nightshade (*S. nigrum*), an annual or biennial, with erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers and globose black berries, grows as a weed in waste place in most parts of the world. It is only slightly narcotic. The leaves in a fresh state are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries, though generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid solanine found also in the shoots of the potato. Several comparatively innocuous species, such as the horsenettle or apple of Sodom (*S. carolinense*) with orange-yellow berries, are natives of the dry western portions of the United States and Canada, and one, the bittersweet, blue bindweed, felon wort, poison-flower or woody nightshade (*S. dulcamara*), is naturalized all over the eastern half of the country. (See DULCAMARA). The deadly nightshade (see BELLADONNA) is a member of an allied genus, whose toxic principle is atropin (q.v.).

NIGIDIUS FIGULIS, Publius, Roman scholar: b. about 98 B.C.; d. 44 B.C. He took part in political affairs during the closing days of the republic; became praetor in 59 B.C.; and having sided with Pompey in the Civil War was compelled by Caesar to live in exile. In philosophy he was a Pythagorean; and for the scope of his learning he was ranked by Aulus Gellius next to Varro (q.v.). His fame as an astrologer was great, and in the 'Chronicle' of Eusebius he is styled "Pythagoricus et magus." Gellius complains of the obscurity and subtlety of Figulus' writings, but the examples he adduces in proof are not thought by critics to support the assertion. The fragments extant have been edited by Swoboda (1889). Consult also Röhrig, 'De Nigidio Figulo' (1887).

NIGRITE. A variety of asphalt mined at Soldier Summit, Utah. Brittle, imperfectly

fusible, imperfectly soluble and probably useful for same purposes as grahamite.

NIGRITIA, nī-grīsh'ī-ā. See **SUDAN**.

NIHILIANIST, in *theology*, one who taught "*Christus, secundum quod est homo, nihil est*," that is, the human nature of Christ had no existence, so far as it could be called his. In other words Christ did not become anything different from what he was before, by assuming human nature, because no change can be wrought in the unchangeable God, and a man is not to be called a cloak because he puts one on. This was the view of Abelard, and John of Damascus, and was held to be tenable, at least, by Peter Lombard (see **LOMBARD, PETER**). It was condemned in the Lateran Council of 1179.

NIHILISM, from the Latin *nihil* (a trifle, nothing), the state or condition of nihility, being nothing. A general term used to define a Russian socialistic movement, and a name also applied in metaphysics to the doctrine that refuses a substantial reality to the existences of which man is conscious. In Russia the word Nihilist was first applied by Ivan Turgenev to the hero of his novel 'Fathers and Sons,' who was intended to be the personification of a movement in Russia for the emancipation of women, the independence of children and the spread of natural religion.

Doctrine of Nihilism.—Followers of Nihilism were those who disbelieved that improvement in the social condition of man is possible by orderly progress and evolution; particularly members of any association that was devoted to the work of destroying the established form of the Russian government without any hope or definite theory of substituting another government in its place. In general, the Nihilists stood for communism, free-love and the abolition of religion and centralized government. Nihilism appears to have permeated every stratum of Russian society, and its recruits and followers are gathered from every social grade, alike from the nobility, the army and the peasants. The Bolsheviks of the revolution of November 1917 are essentially the heirs of the Nihilists.

Early History.—As early as 1818 a party of freedom, so-called, was organized in Russia, and on 14 Dec. 1825 occurred the rising of the Decembrists among the officers and soldiers of the army. These revolutionists aimed at the emancipation of the serfs and the introduction of constitutional government. The revolt was quelled, and six of the leaders were executed and 125 others imprisoned or exiled. About 1850 liberal ideas received an impetus from the study of socialistic writers of other countries. On 23 April 1849, some 40 persons were arrested who belonged to an association formed by Petrashevsky, an official of the Foreign Office. These were sentenced to death, but the sentences were commuted to imprisonment and banishment. In 1857 Alexander Herzen founded a journal, the *Kolokol*, which had a remarkable influence upon the Russian youth. In the same year there arose in Russia a movement, under the leadership of Chernishevski, which criticised existing society. In the universities and among the educated everywhere this movement spread like wildfire. In 1864 he

published a novel entitled 'What is to be Done?' which proved a revolutionary firebrand among the peasantry. This appeared while he was in jail, and with the consent of the authorities. Like most of the books of the Nihilists of the time, its propaganda were marked as fiction. Another writer, Shapoff, urged the introduction of self-government and local autonomy. Numerous organizations sprang up in the universities, and in 1862 the various secret associations united under the name of 'Land and Freedom.' In 1866 a certain Karakozov tried to assassinate the Tsar. In 1868 Bakunin commenced the publication of a newspaper in Geneva. In this journal he advocated the total abolition of the state and the substitution of small communes.

The Socialistic Propaganda.—In the early part of 1870 a number of young men and young women of the upper classes voluntarily went to work in the fields and the factories so as personally to carry on Socialistic propaganda and distribute Socialistic literature. Their organs were the *Forward* of London and the *Workingman* of Geneva. This work continued about six years, during which time there were 23 political trials of 417 persons, half of whom were condemned to exile in Siberia or to hard labor in the mines. During this period there existed a more moderate party, but it failed to satisfy the demands of the young men of the universities. In 1875 the Narodniki "nationalists" became a prominent organization. The government became active, and during 1876 and 1877 the prisons were filled with propagandists.

The Party of Removal.—In 1877 former adherents of the Nihilistic movement organized a new and stronger secret party, which aimed at the removal by force of crowned heads, and a warfare against the government. On 24 Jan. 1878, a young woman of 28, named Vera Zasulich, shot at General Trepoff, who had caused a prisoner to be whipped for refusing to take off his hat to him. She was tried before a jury, and, strangely enough, was acquitted. The government was enraged and had the verdict annulled. On 4 Aug. 1878 General Mesentzoff was killed, and 22 Feb. 1879, the governor of Kharkov, Prince Kropotkin, was assassinated. On 2 April 1879, an attempt to assassinate the emperor, Alexander II, was made by Soloviev. He was captured and hanged. Alexander II (q.v.) was assassinated 13 March 1881. These crimes were claimed by a secret revolutionary committee which really had very little authority over the direct perpetrators.

The Will of the People.—Some time later at a secret meeting of this committee held at Lipetz, the acquisition of political freedom was declared to be the first necessity. It was hoped to gain this by the formation of a legislative body, elected by the people, with guarantees for electoral independence, and liberty to agitate for reforms. This was demanded from Alexander III (q.v.) shortly after the assassination of his predecessor as the price of cessation from violence. This new party, the "Narodnaia Volia" or "Will of the People," sought to overthrow despotism by execution of the communistic instincts of the peasants. It set forth the following demands: (1) A representative assembly having supreme control in

state matters; (2) provincial self-government with elective officers; (3) village communism; (4) freedom of conscience, press, speech, association and political agitation; (5) suffrage; (6) a national militia instead of a standing army; (7) nationalization of land; (8) measures to socialize factories. This movement proved a total failure and the party collapsed in 1885.

Latter-Day Conditions.—The condition of Nihilism in Russia before revolutions of 1917 has been likened to a sleeping volcano. There had been no successful outbreak and few assassinations although the secret party existed in larger numbers than ever before. The discoveries of the police showed that Nihilism was widely spreading in Russia, not only among the working classes but among the aristocracy, and even in the army, especially in Saint Petersburg, and in many of the principal cities and towns. Secret affiliations were known to exist between the Russian Nihilists and the French and Italian anarchists. Relieved of the oppression from above by the successful outcome of the revolution of May 1917, Nihilism has given rise to the Bolsheviki, the dominant party at present (January 1918). See ANARCHISM; MAXAMILLISTS; SOCIALISM.

Bibliography.—Kennan, 'Siberia and the Exile System' (New York 1891); Kornilov, 'Modern Russian History' (tr. New York 1917); Krapotkin, 'Memoirs of a Revolutionist' (Boston 1899); Milyoukov, 'Russia and Its Crisis' (Chicago 1906); Tikhomiroff, 'Russia, Political and Social' (London 1887); and 'Russia under the Tsars' (London 1885).

NIHONGI, *nē'hōn-gē*, a Japanese historical work embracing records of ancient Japan. It was first issued in 712 as the *Kojiki*, and was edited and fashioned on the model of Chinese histories, reissued in 720.

NIIGATA, *nē-ē-gā'tā*, Japan, a seaport city, capital of the province of Echigo, on the west coast of the island of Hondo, nearly opposite the island of Sado, on the west bank of the Shinanogawa. Its streets are intersected by canals and there are 200 bridges. It was one of the treaty ports opened in 1859, but owing to unsuitable harbor, now deepened by dredging, its foreign trade has been nominal; its coasting and internal trade, however, is important and increasing, the province being rich in petroleum and minerals, and agriculture being well developed. Pop. 66,622.

NIJMEGEN, *nī'mā-hēn*. See NIMWEGEN.

NIJNE-TAGILSK, *nēzh'nē-tā-gīlsk'*, East Russia, the chief town of the Ural Mountains mining region in the government of Perm, on the Tagil, 135 miles east of Perm. Its chief industrial establishments are the iron works founded by Demidoff; iron, gold, copper and platinum are mined in the surrounding district. Pop. 45,179.

NIJNI-NOVGOROD, *nēzh'nī-nōv'gō-rōd*, or **NIZHNI-NOVGOROD** ('Lower Novgorod'), Russia, a government bounded north by the governments of Kostroma and Viatka, east by Kasan and Simbirsk, south by Penza and Tamboff and west by Vladimir; area, 19,789 square miles. The capital is Nijni-Novgorod (q.v.). The surface forms an extensive plain, occasionally broken and diversified by low un-

dulating hills. These hills are almost invariably composed of limestone, which is largely developed over the whole government. The only metal found is iron; gypsum prevails in every quarter. The entire government belongs to the basin of the Volga, which, entering it on the northwest, and traversing it in one vast curve to the east, drains a considerable portion of it directly, all the other drainage being brought to it by the Oka and its tributaries on the west, the Sura and its tributaries on the east and the Senets and Vetluga on the north. The soil is of remarkable fertility, rendering this government the granary of Russia. The principal crops, in addition to the ordinary cereals, are hemp and flax. Much attention also is paid to the production of fruit. The extent of forest is equal to that of arable land, and there are tracts of excellent timber. Both manufactures and trade have made great progress. Several governments possess much larger establishments, but in none is the spirit of activity and enterprise more universal. The principal manufactures are coarse cloth, canvas, cordage, glass, soap and leather; domestic industries are important and growing. The trade includes corn, flour, hemp and flax, iron and ironmongery, etc. The central position of this government, and its large navigable rivers, are highly favorable to its trade. Pop. 2,081,200.

NIJNI-NOVGOROD, **NIZHNI-NOVGOROD**, or simply **NIJNIY**, Russia, the capital of a government of the same name, at the confluence of the Oka and Volga, 273 (by rail) miles east of Moscow. It is of world-wide celebrity in connection with its great commercial fair which has been held here annually since 1816, lasts from 15 July to 10 September and is attended by an average of 400,000 dealers and visitors, from all countries between England and China. There is an upper city containing the Kremlin, a lower city and a suburb. The Kremlin, finely situated on the loftiest point of the high town, is surrounded by a lofty wall flanked with towers, round or square, and contains the principal edifices, particularly two cathedrals, with precious relics, one a picture 900 years old, the governor's palace, and an episcopal seminary. With the exception of these, the elegant church of the Holy Women, and a few other public edifices, the whole town is built of wood and possesses little interest. It is, however, becoming noted for its educational institutions, including schools, libraries and museums. For the convenience of those frequenting the fairs there is an enormous market hall, electric lighting and an electric street railroad, and 60 blocks of buildings for booths, containing more than 2,500 apartments separated by fireproof walls. The value of goods sold at one of these fairs often exceeds \$90,000,000. At these fairs all foreign goods are supplied in smaller quantities, those of Russian production showing an increase. Nijni-Novgorod, founded in 1221, was devastated on several occasions by the Tartars; its prosperity dates from 1816 when the great fair was removed to Nijni-Novgorod from Makarieff, after a great fire. Pop. 112,300.

NIKA (*nē'ka*) **RIOT**. The insurrection in Constantinople in 532 against Justinian, caused by the contention between the Blue and Green factions. See JUSTINIAN I.

NIKE, nī'kē, in Greek mythology, the goddess of victory; called by the Romans Victoria. Her festival was on 1 November. In art she is generally represented as a winged female figure. Her attributes are a palm branch, a garland and sometimes a herald's staff.

NIKE APTEROS, or **ATHENE NIKE**, a small but beautiful Doric temple standing on a bastion flanking the entrance to the Athenian Acropolis. It was torn down by the Turks in the 17th century.

NIKISCH, nē'kīsh, **Arthur**, Hungarian orchestral conductor; b. Szentmiklos, Hungary, 12 Oct. 1855; d. Leipzig, 23 Jan. 1922. He studied violin, composition and piano under Hellmesberger, Dessoff and Schenner, respectively, in the Vienna Conservatory; was first violin in the Vienna Royal Opera orchestra for a year; and then in 1877 became musical director of the City Theatre of Leipzig. He directed the Boston Symphony Orchestra 1889-93, the Royal Hungarian Opera in Budapest 1893-99, and the Philharmonic concerts in Leipzig thereafter. In Leipzig he conducted the famous Gewandhaus orchestra. He toured the United States in 1912 with the London Symphony Orchestra. Nikisch wrote 'Die Christnacht,' and other music. Consult the study by Pfohl (1900).

NIKITA, nē-kē'tā, **Louise**. See **NICHOLSON**, LOUISA MARGARET.

NIKITIN, nyē-kē'tyēn, **Ivan Savitch**, Russian poet; b. Voronezh, 3 Oct. 1824; d. there, 28 Oct. 1861. He was educated in the seminary of his native town and on the failure of his family fortunes managed a roadside inn in 1843. He also kept a book store toward the end of his life. Nikitin began to write about 1850. His patriotic poem 'Russia,' published in 1853, attracted attention and was followed by a volume of poems (1856), issued under the patronage of Count Dmitri Tolstoy. In 1858 he won much fame by the publication of a poem, 'Kulak' (The Money-Lender), which portrays peasant life in graphic style. 'The Volga Boatman'; 'The Ploughman' and 'A Winter Night in a Village' became very popular. Nikitin also wrote two novels. Some of his poems have been translated into English. His biographer, De Poulé, issued a complete collection of his works (Moscow 1886). Consult biography by Sawizkij (Petrograd 1893); and Newmarch, Rosa, 'Poetry and Progress in Russia' (New York 1907).

NIKKO (Sun's Brightness). Properly speaking Nikko is the name of a mountainous district lying about 100 miles to the north of Tokyo; but it is generally applied to the principal villages, Hachi-ishi and Irimachi, 91 miles from Tokyo by the Northern Railway and the sacred grounds between them. Lying 2,000 feet above the sea, Nikko is a delightful summer resort. The mountain range in which it is picturesquely located is called Nikko-Zan (Mountains of the Sun's Brightness). From time immemorial Nikko, with its mountains, cascades and monumental forest trees, has always been revered by the Japanese. A Japanese proverb says: "Do not use the word magnificent till you have seen Nikko." A Shinto temple existed at Nikko in remote times; but it was removed and in 767 a Buddhist temple was founded by Shodo Sho-nin, the subject

of many strange legends. In the 17th century was added the mausoleum of the illustrious Iyeyasu, founder of the Tokugawa dynasty, who was buried there with amazing pomp in 1617, and the tomb of his scarcely less famous grandson, Iyemitsu, who was slain in 1650 while visiting his grandfather's tomb. On issuing from the village one of the first objects to attract attention is the *Mihashi*, or Sacred Red Bridge, spanning the *Daiya-gawa*, a stream about 40 feet wide. This bridge, erected in 1638, was closed to all persons but the Shogun, save twice a year when pilgrims were allowed to walk across. Having been washed away in 1902 this bridge was restored in 1907. Forty yards lower down is the bridge for ordinary visitors. Ascending a paved slope, through a grove of cryptomerias, the visitor reaches the enclosure commonly spoken of as *Mangwanji*, within which stands the *Sambutsudo*, or Hall of the Three Buddhas, so called from the gigantic gilt images of the thousand-handed Kwannon. Near this is the famous pillar called *Sorinto*, erected in 1643 for the purpose of averting evil influences. This is a cylindrical copper column, 42 feet high, very black, and adorned at the top with a series of lotus flowers from the petals of which hang small bells. Broad steps between two rows of cryptomerias lead to the granite *torii*, presented by the Daimyo of Chikuzen in 1618, on the left of which is a five-storied pagoda of graceful form and painted in harmonious colors. This building (104 feet) was given in 1649. Around its base the signs of the zodiac are carved. Among the other buildings clustering around the shrine of Iyeyasu are the *Ni-o-mon*, or Gate of the Two Kings, with its carvings of lions, unicorns, elephants, tigers and peonies; the vermilion-colored wall that encloses store-houses and various buildings connected with the religious rites; a bell-tower with the famous "Moth-eaten Bell," given by the king of Korea; bronze lanterns; and the temple of Yakushi, the patron saint of Iyeyasu. Then comes the *Yomei-mon* gate, with its superb carvings, one of which was purposely carved upside down owing to a superstitious idea that the flawless perfection of this structure might bring misfortune upon the house of Tokugawa by exciting the jealousy of heaven. Beyond lies a court and then comes the *Kara-mon*, or Chinese gate, which gives admission to the most sacred enclosure of all, which is surrounded by the *tamagaki*, or fence, a quadrangle of gilt trellis-work, 50 yards square and superbly carved. Within this trellis stands the chapel called *Hondon*, or oratory, better described as a series of three chambers lavishly decorated with black lacquer and gilt. The last chamber in the Holy of Holies is an expression of Japanese Buddhist art at its acme, "a blaze of gold and resplendent colors, with elaborate paintings of mythological beings and ancient court personages, precious woods inlaid and carved, richly lacquered pillars, splendid metal-work often superimposed layer upon layer—the whole a marvel of minute detail and in perfect preservation." Through a door, over which is a carving called the *Nemuri no Neko*, or Sleeping Cat, one of Hidari Jingoro's most famous works, the visitor passes; and, after ascending 200 steps, finds the tomb of Iyeyasu

on the hill beyond. Tall cryptomerias overshadow this, a small bronze pagoda, with a stone table in front bearing an immense bronze stork with brass candlestick in its mouth, an incense burner and a vase with lotus flowers. The whole is enclosed by a high stone wall. Lacquered buildings, Buddhist images, pagodas and *torii* are abundant in the vicinity. Flights of stone steps and carved gates lead likewise to the mausoleum of Iyemitsu, the oratory and chapels of whom are not less magnificent than those of Iyeyasu. The tomb itself is on the summit of a hill called *Hotoke-iwa*, and not far away is buried Iyeyasu's horse, which carried Iyeyasu in the decisive battle of Seki-ga-hara in 1600. The trees on this hill are of marvelous variety and beauty, particularly in the autumn. Numerous shrines, temples, sacred buildings and images fill the great enclosure.

Thirteen of the "Abbots" of Nikko (who were always princes of the imperial blood) are buried in the grounds. The magnificent residence of the abbots was burned in 1871 by a fire that destroyed a large number of the temples. What the visitor sees is, therefore, but a fragment of Nikko's former splendor. Enough remains to astonish and bewilder the eyes and mind. Since the beginning of the present century judicious repairs have been proceeding. A great festival is held here annually on 1 and 2 June. The sacred palanquins containing the divine symbols are then borne in procession, when ancient costumes, masks and armor are donned by the villagers, old and young taking part in the display. Another, but less elaborate, ceremonial takes place annually on 17 September. Many foreign residents of Tokio have villas in Nikko, or at Chuzenji, seven miles beyond. The one drawback to the climate is the frequent rain. Within a radius of 15 miles there are no less than 25 or 30 lovely cascades. The mountain climbs of Nyoho-Zan and Nantai-Zan attract many tourists. Nikko is not only noted for its superb wood-carving and painting and the most perfect assemblage of shrines in all Japan, but for the glorious tints of its foliage at the beginning of November. Hence it has been described as "a double glory—a glory of nature and a glory of art." Nikko is a mart for skins of the badger, deer, marten, wild-boar, etc., and for various pretty articles made of a black fossil wood (*jindai-boku*), brought from Sendai in the north. (See IYEFASU and TOKUGAWA). Consult Tyndale, Walter, 'Japan and the Japanese' (London 1910); Clarke, Joseph I. C., 'Japan at First Hand' (New York 1918).

NIKOLAI NIKOLAIEVITCH, *nyē'kō-lā'yē-vitch*, (Grand Duke Nicholas), Russian general: b. Saint Petersburg, 6 Nov. 1856. He is the second cousin of the Emperor Nicholas II. He was graduated from the Nikolaiev Military Academy and made lieutenant of cavalry in 1871. During the Russo-Turkish War he became junior officer of a Hussar regiment and was decorated for conspicuous bravery; receiving the Cross of Saint George and the Golden Sword for his daring to cross the Balkans and the Danube. He also received the Prussian order 'Pour le Merite.' He took part in the capture of Sofia and Adrianople. In 1893 he was made lieutenant-general; in 1895 inspector of cavalry and colonel of Hussars of His

Majesty's guard; in 1905 he was made major-general of the Guards and president of the council of defense; and in the next year became commander of the military district of Petrograd. In 1907 he married the Princess Anastasia (b. Cettinge, 1867), daughter of the king of Montenegro and sister of the queen of Italy. His great military reputation and his knowledge of European strategy caused him to be appointed commander-in-chief of the Russian army at the outbreak of the European War in 1914. In September 1915 he was removed from the command in European Russia and sent to the Caucasus to take command against the Turks in that region, being superseded in the command of the European Russian army by the Tsar. Nicholas was largely instrumental for the issuance of the manifesto promising the Poles national autonomy. He is a profound student of all military matters and was one of the first in Russia to appreciate the value of aviation. Nicholas is a good writer and is fond of delving into Russian history. He is also a noted sportsman and has in his palace at Petrograd a unique collection of stuffed bears, which he himself killed in various parts of the world. Consult 'Le Grand Duke Nicolas' (in *Le Correspondant*, Paris 1915).

NIKOLAIEFF, *nē-kō-l'ī'ēf*, or **NICOLAIEV**, Russia, a seaport, and the chief naval station on the Black Sea, at the confluence of the Ingul and Bug, 36 miles northwest and in the government of Kherson. It occupies a large space, is fortified and well built, with wide streets and a finely planted boulevard. It is administered by a governor, who is also commander-in-chief of the Black Sea fleet. It was founded in 1791, has important dock yards, depots and machine shops, and a floating dock anchored in the Bug; also tobacco factories and a large trade in grain. Pop. 106,300 (about 17 per cent being Jews).

NIKON, *nē'kōn*, Russian patriarch and primate: b. 1605; d. 17 Aug. 1681. He was appointed (1646) by the Tsar Alexis Mikhailovitch to be archimandrite of the Novospasky monastery in Moscow, became metropolitan of Novgorod in 1648 and in 1652 patriarch of Russia. In 1666 he was deposed and banished to a monastery. He died while on his way, by imperial permission, to the monastery of the Resurrection of Christ, which Nikon himself had built, and where he had gone into temporary retirement in 1658. He introduced reforms into the service of the Church, upheld monasticism, lived a life of exemplary devotion and aimed at the educational and social advancement of the people. His revision of the debased liturgies of the Church in order to bring them into conformity with their originals gave rise to the sect of the Raskolnics (q.v.) or "Old Believers," and culminated in his own disgrace; but his reforms were adopted. Consult Palmer, W., 'The Patriarch and the Tsar' (1871-76).

NIKOPOL, Bulgaria, chief town in the sub-prefecture in the district of Plevna on the Danube, 24 miles northeast of Plevna, on the railway from Sofia to Bucharest. As a military post it has been important for centuries and is commanded by a citadel and fortifications which run down to the river. A mined castle dominates the scene and gives a touch of pic-

turesqueness to the country. Here, too, the Danube is joined by the Osem. Until the creation of a new port at Somovit, Nikopol was the outlet for the trade of Plevna, Lovtcha and other inland towns. It now has additional trade on account of the railway. The chief exports are cereals and the chief industries tanning and fishing. The town is also called Nicopolis ad Istrum, being confused with the town of Nicopolis founded by Trajan to commemorate his victory over the Dacians, several miles below at a spot still called Nikup, at the confluence of the Iatrus or Qantra with the Danube. Nikopoli occupies the site of the ancient Asamus. It has seen many battles. Sigismund of Hungary captured the fortress in 1392 and 1395, and he, in turn, was defeated by the Turks under Bajazet I in 1396. The town was besieged by Ladislaus I of Hungary in 1444; the Turks were defeated by Bathori in 1595 and by Michael of Wallachia in 1598; the town was captured by Pasvan-oglu in 1797; the Russians under Kamensky took it in 1810; the Turkish fleet was destroyed here and the Turkish camp taken by Govarov in 1829, and the town was captured and burned by the Russians under Krüdener in 1877. Good wine is produced in the country and there is considerable trade between Nikopol and Wallachia, as well as to other parts of Bulgaria. Nikopol is inhabited chiefly by Bulgarians and Turks. Pop. (1910), 5,379.

NIKOPOL, Russia, town in the government of Ekaterinoslav, on the right bank of the Dnieper, 70 miles southwest of Ekaterinoslav. It is situated on an elongated peninsula between two arms of the Dnieper; and as the banks are low and marshy here it is a place where the Dnieper can be conveniently crossed. Hence, for centuries, Nikopol (formerly called Nikitin Rog), has been an important place. At the present time it is on the highway from Ekaterinoslav to Kherson, the point where the "salt-highway" of the Chumaks, or Little Russian salt-carriers, crosses the Dnieper and leads thence to the Crimea. As Nikopol is also a strategic point, many battles have been fought for its possession, testified by numbers of graves in the vicinity, and in one of these mounds was found the famous Scythian vase representing the capture of wild horses, together with other antiquities. A little beyond the town is situated the old fortified camp of the Zaporogian Cossacks described in Gogol's novel 'Taras Bulba' (1834). Nikopolis is one of the chief centres for the export of corn, hemp, linseed-oil and wool. Agriculture and shipbuilding are also industries. The chief inhabitants are Jews, Mennonites and Little Russians. Pop. (1900), 21,282.

NILE, a river of northeast Africa, celebrated from remote antiquity as the Egyptian Hope or Aur-Aa—Great River, the Hebrew Sihor, and the Greek *Νεῖλος* the longest river of the African continent, and the second in length of the rivers of the world, the Missouri-Mississippi being the longest. Its length is estimated at 4,000 miles, and the area of its basin at 1,082,000 square miles, extending through 35 degrees of latitude, or 2,450 miles in a direct line.

The White Nile or Bahr-el-Abiad flows from Victoria Nyanza, and is joined at Khartum by the Blue Nile or Bahr-el-Azrek which has

its source in the Abyssinian Mountains. The principal feeder of the Victoria Nyanza and the head stream of the Nile proper is the Kagera, formed by three tributaries, the chief of which is the Nyavarongo, which rises in about 2° 30' S. at an altitude of about 7,000 feet; the Kagera flows through a delta into Victoria Nyanza just north of 1°. Other influents are the Katonga from the west, the Nzota from the northeast, the Morao and Ruvano from the east. The great river which flows out of Victoria Nyanza in the north at about lat. 0° 30' N., and long. 33° 40' E., before its identity with the Nile was known, was called the Kari or Somerset River. At its outflow from the lake it forms the unimportant Ripon Falls, then flows northwest, and about lat. 1° 40' N. expands into Lake Ibrahim Pasha, discovered in 1874. On again contracting to the dimensions of a river it flows first west, then northeast to lat. 2° 15' N., where it forms the Falls of Karuma. It then turns west, and after forming the Murchison Falls, enters, at the town of Magungo, the Albert Nyanza, at an elevation of about 2,550 feet. Magungo lies on the east side of the lake, close to its northeastern extremity, and exactly at this latter point, about lat. 2° 35' N. and long. 31° 22' E., the river again leaves the lake, flowing in a northerly direction. Above Gondokoro, a town lying about lat. 5° N., the river forms a series of cataracts, and till 1876 the part of the river lying between these cataracts and the Albert Nyanza was never fully explored. In that year, under the direction of Colonel Gordon, a steamer was carried in pieces round the cataracts to Dufle, and on 7 March Romolo Gessi started thence to sail up the river, and on the 18th of the same month reached the Albert Nyanza. The whole of this part of the river, 164 miles long, is navigable, deep and broad, in many places with a breadth of upward of 700 yards.

Not far below Gondokoro, which is nearly due north of the outlet of the Albert Nyanza, the Nile begins to flow more to the west till it reaches lat. 9° N., where it receives the Bahr-el-Ghazal, the most important of the tributaries that flow into it from the left bank. On receiving this affluent it turns due east for about 100 miles, and then after receiving the Sobat from the southeast, a very important river draining the country between Abyssinia and the Victoria Nyanza, flows almost due north to Khartum. Here it is joined from the east by the Blue Nile or Bahr-el-Azrek, the source of which was discovered by Bruce in 1770 in the Abyssinian highlands, in lat. 11° N.; long. 36° 30'. It flows first north into Lake Dembea or Tsana, then emerges from it in an easterly direction, describes a great arc to the south extending below lat. 10° N., then turns to the west, after some distance receives its southern tributary, the Dedhesa, and lastly takes a northerly course. After receiving from the east the rivers Dender and Rahad, it joins the White Nile at Khartum. The united Nile then flows first to the northeast till at lat. 17° 30' N. it receives its last tributary, the Atbara, from the Abyssinian frontier. From its junction with the Atbara the Nile flows north, having on the west or left bank the desert of Bahiúda; on the east Mekheyr, which is commonly called Berber. Lower down it

NILE

1 Rapids of the first cataract

2 Nile boats near Cairo

forms several islands, one of which bears the name of Kandake (Candace), and also one or more cataracts; it then bends west by south, and passes by Jebel Barkal, where stand the remains of a temple, repaired by Tirhaka (700 B.C.), but probably 1,000 years older. Resuming its northerly course, it enters the plains of Dongola, and forms several islands of great extent. Quitting these plains by a cataract, the river flows through the districts of Mahas, Sukkot, Wadi, Kenúz and Batn-el-Hajar (or the Glen of Rocks), at the head of which is the second or great cataract, and entering Egypt at Philæ—the Pi-lakh or limit of the Egyptians—it descends the lowest cataract to Syene or Assouan, which is in lat. 24° 5' N. From Philæ, lat. 24° 3' N., the Nile flows through Egypt in a single stream as far as Batn-el-Bakara, the ancient Cercasorum, at the head of the Delta, in lat. 30° 15', where it divides into two branches, leading down respectively to Rashid (Rosetta) and Dimyat (Damietta), and entering the sea in about lat. 31° 35' N. These two mouths correspond, as is supposed, to the Phatnitic and Bolbitinic mouths of the ancients, which, however, in ancient times were not so important as the Pelusian mouth on the east and the Canopic on the west, between which, proceeding from east to west, there were other five mouths, named respectively the Tanitic, Mendesian, Phatnitic or Bucolic, Sebennitic and Bolbitinic.

The Nile received divine honors from the Egyptians, and at a later period also from the Greeks and Romans. By the Egyptians he was represented as a hermaphrodite, with a beard and woman's breasts, and a skin of a blue color. The Upper Nile was distinguished from the lower by a peculiar floral symbol. The Nile had a temple dedicated to himself at Nilopolis, and his principal festival is mentioned under the name of Niloa. In Greek and Roman art he is depicted in the attitude of a river god reclining, around whom sport 16 children, an allegorical representation of the height in cubits of the inundations of the river.

As rain scarcely ever falls in the valley of the Nile from the 18th nearly to the 30th parallel, and very scantily even lower down, the river owes its supplies wholly to the copious rains of the countries wherein it rises. In Egypt it begins to increase in June, attains its greatest height in three months, and then subsides as gradually as it rose. The ordinary rise at Cairo is about 25 feet. During the flood a great portion of the Delta and of the valley of Egypt higher up is inundated. In Sennaar also, and Dongola, extensive tracts are watered immediately by the river; but in general the banks of the Nile above Egypt are irrigated by means of the water-wheel. In early times the case was different, as is shown by the composition of the soil formed of alluvial deposits in places no longer reached by the stream, even in its highest state of flood. The changes of level which have taken place in relation to the river are demonstrated by the hieroglyphic inscriptions at Semneh, a day's journey beyond the second cataract, which attest that 4,000 years ago the average height of the Nile at its utmost flood was 23 feet higher than at the present day, while inversely the yearly inundations of the river in Egypt are continually raising the level of the whole surrounding valley. There are two

principal seasons of cultivation—winter from October to April and summer from April to August for land and basin irrigation, and extending to October in the perennially irrigated areas. As the perennially irrigated land receives less alluvial silt than the basin areas, artificially manuring is resorted to, and such crops as sugar cane and cotton in the basin are also chemically manured. Only in the delta of the river and below the first cataract at Assouan is there any great density of population along the banks. With irrigation, the vast areas of soil in the Soudan should make that province one of the most important cotton-producing areas of the world.

The Nile reservoir, for which the great dams at Assouan and Assiout have been constructed, enables wide tracts of land to bear two crops a year instead of one, brings waste districts into tillage, and greatly increases the area of sugar cultivation. See article and illustration under ASSOUAN, Vol. II; also EGYPT; IRRIGATION. Consult in addition to the travels of Bruce, Speke, Baker, Burton and Grant, Brown, R., 'The Story of Africa' (London 1893-94); Chélu, 'Le Nil, le Soudan, l'Égypte' (Paris 1891); Ebers, 'Egypt: Descriptive, Historical and Picturesque' (Eng. trans., London 1898); Hartmann, 'Die Milländer' (ib. 1884); Hayes, 'Sources of the Blue Nile' (ib. 1905); Johnston, H. A., 'The Banks of the Nile' (New York 1913); Wood, 'Egypt under the British' (London 1896).

NILE GROUP, a marble statue of the Alexandrine period now in the Vatican. It shows a half-reclining figure of a vigorous man representing the river Nile; he leans with his left arm on a sphinx; climbing over him are naked chubby children, intended, it is supposed, to typify the height to which the flooded river rises, namely, 16 cubits. The execution of the group is fine, and the whole treatment is peculiarly Alexandrine. The group was found at Rome near the church of Minerva, in the vicinity of a temple of Isis; but it was subsequently removed to the Vatican by the order of Pope Leo X.

NILES, Hezekiah, American publisher: b. East Bradford, Chester, Pa., 10 Oct. 1777; d. Wilmington, Del., 2 April 1839. From 1800-05 he was engaged in the publishing business in Wilmington, Del., then moved to Baltimore, Md., where with George Bourne he edited and published the *Evening Post*. In 1811 he founded *Niles' Register*, a weekly journal, which in 1837 he moved to Washington and published under the name of *Niles' National Register*. While in Washington he obtained a position in the Pension Office, and gave up the editorship of the *Register*, which was moved back to Baltimore in 1838 and continued by his son and others till 1849. He published 'Quill Driving,' a series of humorous essays; and 'Principles and Acts of the Revolution' (1822). The *Niles' Register* was devoted chiefly to the discussion of politics, and is regarded as one of the most valuable sources for the study of the American history of the period; the volumes for

1812-27 have been reprinted. Niles, Ohio, and Niles, Mich., were named for Hezekiah Niles.

NILES, nilz, John Milton, American journalist and politician: b. Windsor, Conn., 20 Aug. 1787; d. Hartford, Conn., 31 May 1856. At 20 he began the study of law privately, and in 1817 settled in Hartford, Conn., where with the co-operation of others he established the *Hartford Times*, of which he was principal editor for several years, and to which he contributed for 30 years; through this paper he warmly supported Andrew Jackson and the Democratic party. Appointed postmaster of Hartford in 1829 he resigned on receiving the executive appointment to the United States Senate, a post which he retained till 1839. In 1839 and 1840 he was Democratic candidate for governor of Connecticut, and in the latter year was postmaster-general under President Van Buren. He was again elected to the Senate in 1842, and on the expiration of his term in 1849 retired from public life. He published *The Independent Whig* (1816); 'Gazetteer of Connecticut and Rhode Island' (1819); 'Life of Commodore Oliver H. Perry' (1820); 'History of South America and Mexico, and a view of Texas' (1839); 'The Civil Officer' (1840), etc.

NILES, Nathaniel, American statesman: b. South Kingston, R. I., 3 April 1741; d. West Fairlee, Vt., 31 Oct. 1828. He was graduated from Princeton College in 1766 and subsequently studied medicine, law and theology, and he preached in various Congregational churches in New England. He settled in Vermont after the American Revolution and there conducted religious services in his own house for nearly 40 years. He served in the Vermont legislature and was its speaker in 1784, was a judge of the State Supreme Court and was a member of Congress in 1791-95. As "censor" he assisted in the revision of the State constitution and he was six times Presidential elector. He wrote the popular war song 'The American Hero' after the battle of Bunker Hill, and published 'Four Discourses on Secret Prayer' (1773); 'The Fountain of Good' (1777); etc.

NILES, Nathaniel, American lawyer: b. South Kingston, R. I., 15 Sept. 1835; d. 29 June 1917. Educated at Phillips Andover, he was admitted to the bar in 1857. He served for several terms in the New Jersey legislature of which he was speaker in 1872 and where he introduced important measures, notably those establishing 1,200 free school libraries and a free school fund of \$3,000,000 derived from all riparian rights in the State. In 1879 he became government director of the Union Pacific Railroad and in 1884-89 was president of the Tradesmen's National Bank of New York.

NILES, Mich., city in Berrien County; on Saint Joseph River, and on the Michigan Central and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 110 miles southwest of Lansing and 90 miles east of Chicago, Ill. Niles is in the region traversed by the earlier explorers who followed the rivers which were inlets and outlets of the Great Lakes. The French missionaries founded here a mission in 1697. On the site of the city, or nearby, was Fort Saint Joseph, the ruins of which are still in existence. In 1782 Spain claimed the land for miles around Niles on account of the capture,

in 1781, of this fort by a force of Spanish soldiers. In 1828 a colony of eastern home-seekers located at Niles; in 1838 the village was incorporated, and was chartered as a city in 1859. Niles is the commercial centre of a productive agricultural region, and its good water power has made it a manufacturing city. The chief manufactures are flour, lumber, paper, lithographs, furniture, steel tanks, dairy products, poster printing, leather belting, canvas belting, metal store fronts, kitchen cabinets, exhaust fans and blowers, wire cloth, copper lightning rods, cables, automobile and railroad jacks, mole traps, doll beds, wire shovels and forks, coloring matter for packing plants, machine shop and foundry works. There is considerable trade in farm products, fruit and the manufactured articles. The government is vested in a mayor, who holds office one year, and a council. The city owns and operates the electric-light plant and the waterworks. Pop. (1920) 7,311.

NILES, Ohio, city in Trumbull County, on the Mahoning River and on the Baltimore and Ohio, the Erie and the Pennsylvania railroads, about 50 miles southeast of Cleveland. It is a manufacturing centre; the chief manufactures are galvanized iron, foundry and blast furnace products, automatic presses, oil tanks, electric and steam cars, chinaware, incandescent bulbs, metal lath, iron roofing, motor trucks, sheet steel, ice and milk cans and tin. The government is administered under a charter of 1895 and provides for a mayor, who holds office two years, and a council. The electric-light plant and waterworks are owned by the city. Pop. (1920) 13,080.

NILGAI, a large bluish-gray antelope (*Boselaphus tragocamelus*) of the plains and less forested parts of India, where it forms one of the principal game animals of the country. The short conical horns and general appearance of the head and body are somewhat ox-like; but the legs are long and slender, and a large tuft of hair depends from the chest. Nilgai both graze and browse, feed during the day, and are able to thrive with very little water. Where they are not much hunted they become so tame as to be troublesome to visitors; but when much disturbed grow shy and wary. Their chase is therefore often interesting, but the small horns make so poor a trophy that they are not often shot. The best sport is obtained by running them down on horseback and killing them by spearing. Consult works on East Indian zoology and sport, especially Kinloch, 'Large Game Shooting' (1895), and Baker, 'Wild Beast' (1890); Blanford, W. T., 'Fauna of British India: Mammals' (London 1889); Lydekker, R., 'The Game Animals of India' (ib. 1907).

NILGIRI, nil-gé-rē, or **NEILGHERRY, HILLS** ('Blue Mountains'), India, a southern plateau-like range of Madras, giving its name to a district, and owing to its great elevation and delightfully cool climate, much resorted to by invalided Europeans resident in India, the principal health-station being Ootacamund. The hills rise abruptly from the plains 40 miles from the west coast, to an average height of 6,000 feet, the highest peak shooting up to 8,760 feet. The mass is isolated, with the exception that a precipitous granite ridge leaves its western face

and connects with the Western Ghâts. The surface consists of grassy uplands with large groves of forest trees; but the lower slopes are heavily timbered. Coffee, tea and cinchona are cultivated. The Nilgiris are inhabited by five distinct tribes, of whom the Todas are the most interesting. They speak a Dravidian dialect and practise polyandry. The men are tall and athletic, with Roman noses, black bushy beards and eyebrows, but they are dirty in their habits. (See 'The Todas,' by Rivers (1900). Their sole occupation is tending cattle. The Nilgiris district has an area of 958 square miles. Pop. about 115,000.

NILOMETER, in *hydraulics*, an instrument for measuring the rise of the Nile during its periodical floods. On the island of Er-Ródah, south of Cairo, is a graduated pillar, upon which the height of the water is read off. The pillar stands in a well which communicates with the river. In the time of Pliny, a height of 12 cubits meant famine, 13 scarcity, 15 safety and 16 plenty. At present the canals are cut and distribution commences when the river reaches 18 cubits; 19 cubits is tolerable, 20 adequate, 21 excellent, 22 abundant, and 24 ruinous. In ancient times taxation varied according to the height of the inundations. See NILE, THE.

NILSSON, nîl'sôn, **Christine**, Swedish operatic soprano: b. Hassaby, near Wexiö, Sweden, 20 Aug. 1843; d. Copenhagen, 22 Nov. 1921. She was the only daughter of a poor farmer, at nine began to sing at village concerts, and educated for the operatic stage by Berwald at Stockholm, and Massé and Wartel at Paris. In 1864 she made her first appearance as Violetta in 'La Traviata' at the Theatre Lyrique, Paris; and she appeared in 1867 in that rôle for the first time in England at London. She sang in the United States in concert in 1870, in opera in 1871; and appeared there again in 1873-74 and 1882. She was last heard in New York on 16 April 1883. Among her most famous impersonations were Ophelia in Thomas' 'Hamlet,' and Marguerite in Gounod's 'Faust'; Elvira in 'Don Giovanni' and Elsa in 'Lohengrin.' In 1872 she married M. Auguste Rouzaud, a Parisian merchant, who died in 1882; and in 1886 she married Count A. de Miranda, who died in 1902. After 1888 she lived in retirement. Her voice was a soprano of moderate power, but very brilliant and even.

NIMBLE FLY, an insect that takes its name from its rapid movements. It belongs to the family Dexiidae. Its legs are extremely long. In its early stages this fly is parasitic and inhabits beetles and snails. About 50 species belong to North America. Consult Kellogg, Vernon L., 'American Insects' (New York 1908, pp. 301-357).

NIMBUS, (1) in painting, the halo or collection of rays with which artists surround the heads of sacred persons, in Christian art, of Christ, and the angels and saints. The use of this ornament is both ancient and widespread, being probably of astrological origin, and it is exemplified in the Indian, Egyptian, Etruscan, Greek and Roman religions. The ancient poets speak of their deities as being crowned with such a nimbus in their occasional appearances on earth, and in paintings this nimbus was

represented in the same way as in the paintings of Roman Catholic artists. The nimbus as represented in Christian art (beginning in the 5th century) is usually circular in form, but sometimes it is triangular; sometimes in the form of three rays, one proceeding from the summit of the head, and the other two from the sides, so that the three form three arms of a cross. The triangular nimbus symbolizes God the Father and the Trinity; it is sometimes enclosed in a circle, which symbolizes eternity. The nimbus with three rays is also a symbol of the Trinity. The Virgin is symbolized by a single ring, and sometimes by a crown or diadem. Another form of the nimbus is that in which one of the common circular shape supports a cross. In later times the nimbus was represented in a lighter or more aerial form, and melting as it were into the picture. (2) In meteorology, the word is applied to a rain cloud; sometimes classed as if forming a primary or fundamental variety of cloud; it is really a mixture of the stratus, the cumulus and the cirrus. It has a uniform gray tint and fringed edges.

NIMEGUEN, nîm'a-gên. See NIMWEGEN.

NÎMES, nêm, or **NISMES**, France, a south-eastern city, capital of the department of Gard, 62 miles northwest of Marseilles, noted for its ancient buildings and monuments of Roman origin, which are second only to those of Rome. It is situated in a delightful plain near the outspurs of the Cevennes and handsome boulevards occupy the site of the former ramparts. The city proper is small and irregularly laid out, with narrow streets and ill-built houses; but its three suburbs, one of which, called the Cours-Neuf, is larger than the city itself, present a finer aspect, having wide, straight avenues, fine public walks and handsome buildings. Among the edifices of the Christian era are the cathedral, begun in the 11th century but constructed chiefly in the 16th and 17th and occupying the site of a temple of Apollo; the church of Saint Paul; the new palace of justice; the general hospital; the Hôtel Dieu, rebuilt in 1830; the public library (112,000 volumes); the central house of detention, which is the citadel built by Vauban over the remains of the old Fort Rohan erected in 1629 by the Calvinists; and the fine monumental fountain by Pradier, erected in 1851, on the esplanade. The public garden, where is still to be seen the fountain that furnished the Roman baths with water, and the beautiful promenade known as the Cours Feuchères, are also attractive features. Nîmes is the seat of a Roman Catholic bishop, of a Protestant consistory, and has tribunals of primary jurisdiction and commerce, a departmental academy, several learned institutions, a lyceum or college, a normal school, a theological seminary, schools of drawing, chemistry and physics, geometry and mechanics as applied to the arts, and a museum of natural history.

The monuments of the Roman period are the Maison Carrée, so called from its rectangular form, a beautiful Corinthian temple nearly in the centre of the city. It stands on a stylobate, and is approached by 15 steps; the platform is 82½ feet long and 40¼ feet wide, and the building and platform together are 58½ feet high. It is surrounded by 30 columns, 10 of which are detached and form the portico. It suffered

greatly during the Middle Ages, but since 1789 it has been restored and surrounded by an iron railing. In 1823 it was converted into a museum of paintings and antiques. The amphitheatre, or Les Arènes, is the most perfect of its kind extant. Its height outside is from 68 to 104 feet, and its external circumference 1,174½ feet. It has from 32 to 35 ranges of seats, and was capable of accommodating from 17,000 to 23,000 spectators. It was used as a fortress by the Visigoths and the Saracens, when attacked by the Franks; during the following centuries it was also occupied as a stronghold. No fewer than 2,000 persons had established their abode within the walls of this building, when in 1809 it was cleared by order of the prefect; and it has since been protected against encroachments. The Tour Magne (*turris magna*) is the remnant of a tower which flanked the ancient walls. The boulevards now occupy the site of the ramparts, but portions of them are still extant in the Porte d'Auguste and Porte de France, two Roman gates, the former of which is ornamented with sculptures. To these monuments must be added a ruined *nymphæum*, a fane dedicated to the nymphs, which communicated with a neighboring bath for women, the remains of which have been mistaken for those of a temple of Diana. The magnificent aqueduct, known as the Pont du Gard, is in the vicinity of Nîmes.

In point of industry and commerce Nîmes holds a distinguished rank; it is the great southern mart for raw and manufactured silk. Its manufactures are principally silk shawls and hosiery; mixed silk, cotton, and woolen stuffs; blonde lace and tulles, galloons, ribbons, carpets and leather products. There are several large dyeing and printing establishments, vinegar factories and distilleries. Its trade is mostly in wine, brandies, vinegar, essences and oil. There are limestone quarries nearby.

Nîmes is supposed to have been built by a Greek colony, and was afterward for about 500 years in the possession of the Romans. In the 16th century it became a stronghold of Calvinism, and suffered much during the civil wars. The treaty known as the Pacification of Nîmes, concluded here in 1629, granted freedom of worship to the Huguenots, but deprived them of their fortified towns. In 1815 it was the scene of religious violence during the reaction that succeeded the fall of Napoleon. Guizot and Daudet were natives of this town. Pop. 80,437.

NIMRAVUS, a genus of large Tertiary fossil cats, typical of the family *Nimravidae*, or *Machærodontidae*, which includes the various sabre-toothed tigers (q.v.).

NIMROD, according to the Mosaic scriptures, the founder of the Babylonian monarchy, son of Cush (Gen. x, 8). He flourished about 2450 B.C.. He is styled a mighty hunter "before the Lord," a somewhat vague expression, but evidently referring to battle and conquest as well as to the chase. All that is definitely known about Nimrod is that he was a Cushite, that he established a kingdom in Shinar, the classic Babylonia, the chief towns being Babel, Erech, Accad, and Calneh, that he extended his kingdom northward along the Tigris over Assyria, where he founded a second group of capitals, Nineveh, Rehoboth, Calah and Resen. In the Chaldean epic of the deluge Nimrod has

by some scholars been identified with Gilgamesh, the heroic figure whose story is dated about 2200 B.C. and who is represented as fighting with a wild beast; and by others with Mero-dach, the Assyrian god.

NIMRUD, nīm'rood, Mesopotamia, the name given to a mound which is supposed to be the site of an ancient Assyrian city on the east bank of the Tigris River at the confluence of the Tigris and the Zab Ala, and 18 miles below Mosul. It is supposed to be the city Calah (q.v.) mentioned in Genesis x, 11, a suburb of Nineveh. Excavations have shown the city to have been five miles in circumference and surrounded by walls flanked with towers. Perhaps the most important of the archaeological treasure discovered here is the black obelisk of Shalmaneser II, now in the British Museum, and on which his military exploits are recorded. See NINEVEH.

NIMWEGEN, nīm'wā-gēn, or **NIMEGUEN**, nīm'ā-gēn (ancient NOVIOMAGUS; Dutch, *Nijmegen*), Netherlands, city in the province of Gelderland; on the Waal, about 12 miles south of Arnheim. Built in the form of an amphitheatre, on a series of hills, it overlooks a beautiful valley. It is in a productive agricultural region in which grain and grapes are prominent productions and much attention is given to stock-raising. The 13th century church of Saint Stephen, the ruins of the palace of the Carolingian kings, and the museum of Roman antiquities, are the principal places of interest in the city. The chief manufactures are leather, tin, cutlery and silverware, wine, eau de cologne, flour, and cigars. It has an extensive trade in wine, grain and cattle.

Nimwegen possesses many ruins showing its Roman origin. It was originally a Roman camp by means of which control was exercised over the Teutons living northeast of the Rhine. It was one of the Hanse towns. From 1585 for nearly 100 years it was in the theatre of much of the contentions, and also of the peace-makings among the Spaniards, Swedes, French, Dutch and Austrians. The "Peace of Nimwegen" in 1678-79 was the ending of the contest between the French and the Dutch, the great event in the life of Louis XIV. It marked the time when France became the chief of the Great Powers. Pop. (1910) 56,035, predominantly Catholic.

NINDE, William Xavier, American Methodist bishop: b. Cortland, N. Y., 21 June 1832; d. Detroit, Mich., 3 Jan. 1901. He was graduated from Wesleyan University, Middletown, Conn., in 1855, and was ordained in 1856. He was in charge of various churches in New York and Ohio, and in 1870 was called to the Central Church, Detroit. He accepted the chair of practical theology at Garrett Biblical Institute, Evanston, Ill., in 1873; in 1879-84 he was president of the institute and in 1884 he was elected bishop. He was the president of the Epworth League, 1896-1900. Consult biography by Mary L. Ninde, his daughter (1902).

NINDEMANN, Wilhelm Friedrich Carl, German-American Arctic explorer: b. Gingst, Germany, 22 April 1850. He removed to the United States in 1867 and in 1872 accompanied the *Polaris* expedition. When the *Polaris* was caught in the ice he with 18 of the crew drifted on an ice-floe for seven months. They were

rescued by the *Tigress* in 1873. He joined the *Jeanette* expedition in 1879, and when the vessel was crushed in the ice he was despatched for aid in 1881 by Captain De Long. He assisted in the search for De Long and his companions, whose bodies were discovered the next year. He served in the Spanish-American War. He published 'Eines deutschen Matrosen Nordpolfahrten' (1885).

NINE-BARK, an American shrub (*Opulasta opulifolius*), of the rose family, common throughout the eastern part of the United States. It has an ungainly form, glabrous twigs, bright green, three-lobed, crenate-lentate leaves and small white or purplish flowers in terminal corymbs. Its bloom, remarks Mrs. Lounsberry, is not very pretty, but it redeems itself by the beauty of the ripening pods. "They, hanging in quantities at the ends of its long, curving branches, produce something the same effect as the fruit of a species of *opulus* or cranberry-tree. . . . The common name which would naturally recall one of the hydrangeas, is in reference to a trick of the bark in peeling not nine but many times into dilapidated-looking strips." The hydrangea (q.v.) referred to is *H. radiata*, a showy wild shrub, which is given this name by the mountaineers of the Southern States on account of the ragged peeling of its bark. Both shrubs flourish in rocky and swampy places, and both are susceptible of cultivation. Consult Lounsberry, 'Southern Wildflowers and Trees.' (1901).

NINE-PINS, a game with nine pins or bottle-shaped pieces of wood set on end, at which a large wooden ball is rolled for throwing them down. See BOWLING.

NINE WORTHIES, romantic heroes, grouped together in Arthurian legend, especially in the 'Triumphes des neuf preux,' where the author describes a vision in which he saw three Jews (Joshua, David, Judas Maccabæus), three pagans (Hector, Alexander the Great, Julius Cæsar), and three Christians (Arthur, Charlemagne, Godfrey of Bouillon). These worthies, with occasionally a tenth, Bertrand du Guesclin, and with Guy of Warwick sometimes substituted for Godfrey of Bouillon, may be traced back to old Welsh legends; Brunet says the three triads are of Spanish origin; and Dunlop showed that the list appeared in an old Low German poem on Alexander. Shakespeare makes them the butt of some fooling in 'Love's Labour's Lost.'

NINEKILLER. See BUTCHER-BIRD.

NINETEENTH CENTURY. Some nation in Europe has been at war on the average every second year since 1450, that is, during modern times, but the 19th century had more than its share of these wars. They were, too, ever so much more costly in life than older wars, industrial development having favored the evolution of destructive agents. Napoleon filled the first 15 years. Made first consul (1798), President of the Italian republic (1802), emperor by overwhelming popular vote (1804), he proposed to Tsar Alexander at Tilsit (1807) in the raft conferences on the Niemen River to divide the world between them into eastern and western empires. It seems almost impossible to imagine the 19th century reverting to the dual Byzantine-Roman imperial scheme of things,

yet this was calmly proposed by the man who had made himself, in Freeman's expressive phrase, "the tyrant of Europe." Gibbon, scarce 10 years before, had declared it impossible for a military leader ever again to dictate the destiny of nations as had Alexander the Great, or Cæsar, yet had he but lived a few years he would have seen this almost an accomplished fact. Napoleon admitted, when Alexander seemed favorable to the scheme, that there was but one bar—England—but he felt that if the two emperors were loyal allies, even this obstacle could be made to disappear.

The events which led up to this were the battle of Austerlitz (1805), after which Napoleon became protector of the Federation of the Rhine; the victory at Jena over the Prussians (1806) followed by the appointment of Louis Napoleon as king of Holland and the victories of Eylau and Friedland (1807) over the Russians. After this came the conquest of Spain and Napoleon's attempt to make Joseph, his brother, its king, while Murat, one of his marshals, was made king of Naples. He received a setback in Spain, but won the battle of Wagram (1809) over the Austrians. The following year, divorcing the childless Josephine, he married Marie Louise, the daughter of the emperor of Austria, in the hope to found a dynasty, and the next year his son was crowned king of Rome. At the height of his power (1811) his empire reached from beyond Rome, through France, Holland and Belgium and all the western German states up to Mecklenburg and the Baltic Sea; he was besides king of Italy, to which the Illyrian provinces were subject, protector of the Federation of the Rhine and mediator of Switzerland. Only in Spain where, with the help of the English, a successful stand was made against Napoleon's generals, did his prestige fail. His star had set with this, however, and though in 1812 he won the battles of Smolensko and Borodino, Moscow, after its capture, was burned by the Russians and Napoleon's grand army was destroyed by the Russian snow and the troops which hung on his rear and flanks. With a new army of fresh levies, most of them were mere boys, Napoleon won the battles of Lutz, Bautzen and Dresden but lost the battle of the nations at Leipzig. The German spirit, at last aroused, drove him to the Rhine with the loss of his whole army. He abdicated and was sent to the island of Elba but with the title of emperor (1814). Just a year after his abdication, March 1815, Napoleon returned to France. The restored Bourbons had been tactless beyond even their wont and Napoleon was welcomed by France. Marshal Ney, sent to arrest him, threw himself into the arms of his old commander, and in a few days Napoleon was again firmly seated on the throne. The allies moved against him, but Napoleon, hoping to crush their forces in detail, marched into Flanders where he defeated the Prussians, but was held by the English for the long day (18 June 1815) at Waterloo, until Blücher with a fresh force of Prussians decided the battle. The Hundred Days, as they were called, were over. Napoleon surrendered to the English as the most magnanimous of his enemies, and was sent to Saint Helena, where he died (1821).

England was the supreme, constant factor against Napoleon. He realized this and was ready to make any sacrifice for "six hours' control of that wet ditch"—the Channel. He sold Louisiana to the United States to secure funds for an English invasion (1803) but Nelson's almost complete destruction of the combined French and Spanish fleets off Cape Trafalgar (1805) blocked this. Napoleon's one consolation was that he hoped by rounding out the territory of the United States "to raise up a rival to England that would sooner or later humble her pride." Meantime Robert Fulton had gone to him with his steamboat, but Napoleon failed to recognize the opportunity it would have given him. The one stain on English prestige was the bombardment of Copenhagen and the seizure of the Danish fleet in 1807. Fearful lest the Danes should join Napoleon and shut them out from the Baltic Sea and the rich markets of central Europe, an English fleet in position before Copenhagen, without warning, demanded that the Danes surrender all their ships and naval stores. They were to be held as a deposit and given back at the end of the war. The Danes refused to violate their neutrality thus and did not yield until some 2,000 houses had been destroyed, when their fleet was carried off by the English. The incident aroused the bitterest feelings against Britain and undoubtedly pushed the United States into the War of 1812. Madame de Staël, replying to Jefferson's explanation as to the United States practically helping Napoleon against England, that "America has nothing to do with the continent of Europe," pertinently asked, "Can you be indifferent to the cause of free nations—you the most republican of all?" Jefferson replied that "Bonaparte would die but a nation never dies," and added "the sword can never again be sheathed until the personal safety of Americans on the ocean, among the most important and vital of the rights we possess, is completely provided for." A century later, these expressions were, if possible, even more interesting than when originally written.

Napoleon will be remembered better for what he did for law and social order than as a victorious commander. He strove to be a beneficent autocrat. Professor Sloane terms him "one of the greatest social reformers of history." He healed the wounds inflicted upon France by the Revolution. He invited the Royalist exiles to return. Realizing that a France without religion was a contradiction in terms, he entered into a concordat with the Pope, recognizing him as the head of the Church with full authority. Under his rule prosperity came back to France. Bridges, roads, canals and ports were restored and Napoleon directed the construction of great highways and military roads, triumphs of engineering, across the Alps. Public buildings were restored, sadly needing it since the Revolution, and many magnificent monuments erected, so that Paris and other French cities became the most beautiful in Europe. He reformed the laws of France and the Code Napoleon set his name beside that of Justinian as one of the great lawmakers of history. What the French Convention began was perfected by Napoleon and his code secured the benefits of

the Revolution for the French people. It swept away the old, unequal, oppressive customs and regulations and decrees and laws that were an inheritance from the feudal ages. It recognized the equality of noble and peasant in the eyes of the law; it affected deeply the laws of other countries, and for it Napoleon's name will be honored much more than for his military glory as long as this stage of our civilization lasts.

The Napoleonic wars were followed by the formation of the Holy Alliance, under the inspiration of Tsar Alexander of Russia, its principal members being Russia, Austria and Prussia. Its purpose was announced as the maintenance of peace and order in Europe, the principles of Christianity to be the maxims of governments. All the rulers promised to use their authority "to promote the welfare and secure the happiness of their subjects." Undoubtedly the intentions were the best, and yet the Holy Alliance proved before long to be only a league for the maintenance of absolute government and the protection of the various states from the neutralizing tendencies which had been sown throughout Europe by the French Revolution. Metternich was the moving spirit in it. Entirely reactionary, he could not think that the people should have any share in the government. He was for the old order and his influence was greater than any other down to the middle of the century.

In spite of the Holy Alliance a series of minor wars occurred during the first half of the century, Russia and the sultan (1828), a quadruple alliance of England, France, Spain and Portugal against Don Miguel and Don Carlos (1834), France and Mexico (1838), England and China—to compel the renewal of the opium trade (1840), France with Algiers (1848). There was a much more interesting series of revolutions for popular liberty, most of which failed. The Greek Revolution was followed by the massacre of Scio (1822), Belgium secured its independence from Holland (1830), and the Poles began a struggle for their liberty the same year, but failed and thousands of families were sent to Siberia. The Polish Revolution was renewed (1848), but only to fasten the fetters tighter on the suffering people. In 1848 there were revolutions in France and Sardinia, in Bavaria, Prussia, Schleswig-Holstein, in Hungary, whence Kosuth escaped to the United States, and in various places throughout Italy, including Rome, where a republic was proclaimed 9 Feb. 1849, only to fall very shortly.

The spirit of liberty manifest in the French Revolution failed egregiously, but was destined to spread all during the 19th century. Between 1810 and 1826 all the South American colonies of Spain and Mexico (1836), after an imperial incident under Iturbide (1820), became independent republics. After a revolution Brazil became a constitutional empire of great liberty, independent of Portugal. The revolt of the Greeks against the Turks was unsuccessful, but it attracted the attention of Europe to an impossible situation that could not be permitted to endure, and Byron's romantic death for the cause of Greece at Missolonghi deeply stirred the spirit of liberty everywhere. The Bourbons continued their tactless rule in France and Charles X was forced to flee in 1830, to be

succeeded by Louis Philippe, no longer as king of France, but king of the French. Unfortunately, when his turn came to go (1848), while the French planned to have a republic and the temporary presidency of Lamartine raised high hopes, Louis Napoleon became the first actual President and the *coup d'état* gave him control of France, making his election as emperor (1852) only a matter of form. A cycle had been completed and France was once more destined to imperial domination.

The most important series of political events in the century was the rise of Prussia to the rank of a great power in Europe and of the German Empire under Prussian influence. Early in the century Prussia was prostrate at the feet of Napoleon, bitterly humiliated. This led to reaction and a strenuous military organization of the country, so that eventually Prussian troops were an important factor in the great battle of the nations at Leipzig and a Prussian army under Blücher came to the aid of the English at a critical moment at Waterloo, bringing about Napoleon's ultimate defeat. The king of Prussia had promised his people a constitution, but violated his promise, so Prussia appears in European history until the middle of the century only because of internal disturbances. The Revolution of 1848 sent many promising young Prussians into exile because of their patriotic efforts to secure a constitutional monarchy. Troublous times continued for 10 years, which kept Prussia from any advance in power, but when Wilhelm I became king (1861) he declared that Prussia ought not to be content with what she had, but should strengthen her army and extend her frontiers. As regent while his predecessor, Friedrich Wilhelm IV, was ill he had insisted that the Prussian army ought to be "the nation armed." The new king found himself hopelessly in opposition to the Prussian Parliament which annulled all measures for the provision of funds for the army. In the crisis Wilhelm called on Bismarck (1862) and thereafter Bismarck's spirit ruled Prussia. Disheartened by Parliament's opposition, the king seriously proposed abdication, but Bismarck appealed to his honor as a soldier for his country. The spirit of revolution among the people had brought some liberalization of the government, but Bismarck re-established autocracy and prosperity quieted the people. He steered a devious course as the ally of Russia, in spite of the unpopularity involved, in order to crush the Poles (1863). After defeating Austria's attempt to unify the German states under her leadership at the Frankfort Convention, the next year he formed an alliance with Austria to take Schleswig-Holstein from Denmark. Every consideration except the advancement of Prussia was disregarded. Through agents he led the Danes into thinking that England would surely come to their assistance in case of war, so that they attempted the unequal struggle with Prussian and Austrian armies to their defeat and humiliation (1864). Schleswig-Holstein was placed under the rulership of Prussia and Austria, and when Bismarck proceeded to establish a German naval station at Kiel, Austria was irritated, as he knew it would be, and war broke out (1866). It lasted seven weeks, the Austrians being badly defeated at Koeniggrätz or Sadowa and the road to Vienna lay open. The

intervention of Napoleon III brought a truce. Prussia, now the leading state in Germany, absorbing some of the German principalities which had allied themselves with Austria, proceeded to strengthen her army. France was the next opponent. The opportunity came over the Spanish succession. Queen Isabella was driven out in 1868 and the Spaniards offered the throne to Leopold of Hohenzollern, the head of the Catholic house of that name, related to the reigning house of Prussia. France was strongly opposed to the candidacy. The friction between the countries seemed past, however, when Bismarck, after consulting with Moltke, the head of the Prussian army, as to preparedness, deliberately falsified a telegram making it so irritating to the French as to precipitate the war. Bismarck, in furnishing material for his memoirs, cynically boasted of this afterward, as of other utterly dishonorable diplomatic transactions. Anything was justified so long as it was done for his country.

The Franco-Prussian War was declared 19 July 1870. The French Minister of War boasted that the army was so perfectly equipped that it would not require even a gaiter button for a year. It had been looked up to as the model military organization of the world, studied by all the other nations, but now proved rotten to the core. The Prussian army, on the other hand, was as Moltke had declared ready to the minute. Scarcely two weeks had passed before the series of Prussian victories began. France had counted on the jealousy of the other German states to keep them neutral at least, or perhaps ready to join against Prussia. All sided with Prussia except Austria, which remained neutral. On 3 August the French lost the battle of Wörth, and by 6 August when a rumor was current in Paris that the Prussians were defeated, French armies nearly everywhere were in disastrous retreat.

On 18 August Marshal Bazaine lost the battle of Gravelotte and shortly afterward was isolated at Metz. MacMahon with the emperor was caught at Sedan between two Prussian armies and on 1 September compelled to surrender. This led to the fall of the empire. Paris was soon invested. Gambetta, escaping in a balloon, organized the French Republic. The last hope of the French expired when on 27 October Metz, with 180,000 soldiers, was surrendered by Bazaine. He was tried for treason subsequently and condemned, but the verdict of history is that he was an overestimated man, outgeneraled by Moltke and hampered by confusion in the French military system. On 10 December the German Empire was voted by the Reichstag at Berlin and on 18 December, on the proposal of the king of Bavaria, the representatives of the German states meeting in the palace of Versailles chose King Wilhelm of Prussia as German Emperor, with the right of succession in his family. At the end of the war Bismarck insisted on the cession of Alsace and Lorraine, with their immense mineral wealth, to Germany and an indemnity of five milliards of francs (about \$1,000,000,000). This seemed such a huge sum, coming on the heels of the great losses inflicted by the war, that it was felt that it would cripple France forever. The sum was paid in five years, while France enjoyed unexampled prosperity. United Germany became the most powerful state in

Europe. After he had made the Triple Alliance with Italy and Austria, which somehow was brought to sink its long traditions of enmity so as to secure German support against the growing power of Russia, Bismarck was looked upon as the greatest statesman of Europe. He was quite literally a mere statesman. Everything had been done for Prussia without any thought of the rights of the people, still less of the rights of other peoples or other countries. The policy of "blood and iron," of which he was so proud, was the watchword of Prussianism, continuing its influence even after Bismarck's dismissal by the young emperor, Wilhelm II, in 1889. It worked itself out to its legitimate conclusion and was recognized for the supreme injustice it represented, only with the great War of 1914-18.

The contrast with Bismarck in the 19th century is his great English contemporary, Gladstone. He was the leader in more social reforms, correcting age-long abuses, than any statesman of history. The memorable session of the English Parliament during his first Premiership (1868-74) accomplished an almost incredible amount of legislation for popular benefit. The British Parliament, elected in 1865, dissolved in 1868, on the question of the disestablishment and disendowment of the Irish Church. To the surprise of the Conservatives, who had appealed to the country, the Liberals were returned with an overwhelming majority. The Irish Church bill was at once brought forward, passed by the Commons and when it would probably have been rejected by the House of Lords, the queen wrote to the archbishop of Canterbury, reminding him that the bill had been carried by a very large majority in a House of Commons elected on this issue, so the Lords yielded to the will of the people and the bill was passed. This was the prelude to far-reaching social reforms. In 1870 Gladstone secured the passage of a land act for Ireland and the beginning of justice for the Irish tenant farmers. This bill recognized that the Irish farmer had an estate in his holding and gave the sanction of law to the Ulster custom of tenant right. This session of 1870 was famous for its legislative achievements. Mr. Herbert Paul says that an example of activity so various and so successful can scarcely be found since the days of the Great Parliament (1640). "Between 8 February and 10 August Parliament took the first step, the step which counts, in remodeling the agrarian law of Ireland, established a permanent system of education in England and Wales, introduced into the army the principle of a short enlistment and a reserve, formed a code of neutrality in time of war, erected a scientific theory of naturalization, provided for the extradition of criminals, and abolished the punishment of the innocent with the guilty by the forfeiture of the felon's estate." The following year saw the abolition of the purchase of commissions in the army and of religious tests at the universities which had imposed a great injustice on all who were not prepared to sign the 39 Articles. Dissenters could not take degrees before this, unless prepared to sign the Articles. Gladstone's reforms made the universities national institutions. The Ballot Act reformed the franchise and Gladstone's Irish University scheme was meant to

remove another injustice in Ireland. The English people could not advance so fast as this and Gladstone was replaced as Premier by Disraeli. In contrast with the work of his great political opponent, Gladstone's achievements stand out in ever-increasing prominence as time goes on. Disraeli was a great politician; Gladstone a statesman in the best sense of the word, who realized that the statesman's highest privilege and duty was to provide opportunities whereby the people might secure all possible pursuit of happiness. Following this policy, Gladstone could even change opinions publicly expressed and adhered to for a long time. Toward the end of his life he became a convert to Home Rule for Ireland, in the hope to remove a stigma that had blotted the fair name of England for centuries, and though his purpose was not attained, what he accomplished brought the Irish question into such prominence that it could never again be at rest until properly settled.

For a generation after Napoleon's time, however, Europe, spent with wars, avoided them except for these unimportant conflicts. Immediately after the middle of the century, however, a series of costly wars was initiated. In 1851 when the World's Fair in London was held, the first of the modern universal expositions of which there were to be so many others before the end of the century, the keynote of the international addresses delivered was world peace which seemed to be surely impending. Nations were to make commerce with each other and not war, and exchange art and industrial treasures and not bullets. Littré, the great Positivist philosopher, looked up to as one of the great thinkers of the time, was particularly emphatic in his prophecy of peace. Such hopes were destined to bitter and immediate disappointment. The next 20 years saw a series of great wars. In 1853 Russia went to war with Turkey; England, France and Sardinia allying themselves with the Turks. In 1857-58 the Indian Mutiny imperiled British interests in Asia. In 1859 Sardinia and Austria went to war, with the French as the allies of the Sardinians. Napoleon III won the battle of Solferino and confirmed the impression that the French were the greatest military nation in Europe, for which it was destined to pay so dearly 10 years later. In 1861 the Civil War broke out in America, each side thinking it would be over in three months, but it lasted four bitter years and cost some 600,000 lives and set back American development for a decade. In 1864 Denmark dared to go to war with Prussia and Austria and was, of course, badly defeated, having to give up Mecklenburg and Schwerin to her opponents. In 1866 Prussia and Austria went to war over these Danish provinces and Austria was beaten to her knees in six weeks. In 1870 came the Franco-German War, and in 1877 the war between Russia and Turkey, Russia's victories being neutralized by the International Congress of Berlin which was intent on maintaining the balance of power.

The war in the Crimea had one very practical result which greatly benefited the next generation. The army medical department of the English troops broke down completely under the task of caring for the wounded in the bitter climate of the Crimea. Literally thousands of

wounded English soldiers lay absolutely untouched for many days in the midst of their excretions, almost unfed. The wounded on the deck of a vessel carrying them to the base hospital at Scutari were so crowded that the officers could not go below for their instruments of navigation and had to proceed at hazard. The fetid odor from the wounds was so offensive that some of the officers could not eat. Miss Nightingale, who had some experience in nursing, was asked to organize the nursing care of the soldiers and proceeded to the Crimea to solve the awful problems which had developed. She succeeded, and on her return the organization of nursing generally was taken up and the trained nurse of the present time was the result. Nursing had sunk to the lowest possible ebb, and the women attendants in the hospitals were looked upon as little better than menial servants, many of them actually recruited from the workhouse or the prisons; all that could be expected of them was to keep reasonably sober.

For two centuries hospitals had been running down and reached the lowest depths about the middle of the 19th century. The coming of the trained nurse, an educated woman with definite authority, soon brought reform in hospital organization and construction and Lister's discoveries lifted up surgery, so sadly degenerated for several centuries, until with hospital improvement there came reform also in medical education, with the reintroduction of bedside teaching. As a result of these movements, a great new epoch in hospital work developed which will be looked back upon by future generations as one of the most important landmarks in the history of the century.

The Civil War in the United States was one of the pivotal events of the century and seemed for a time to many a demonstration that a democracy could not endure. It was the culmination of a century of differences of opinion. After the Revolution, the great preponderance of the population was at the South. Virginia, one of the most populous of the States, had more than double New York's number of inhabitants. North Carolina exceeded New York in population by the total census of New York City and Long Island. Maryland was as large as New York and Tennessee followed very closely. The North grew rapidly, the South slowly. In 1810 New York was second in population and it surpassed Virginia by one-third in 1820. Of the first five Presidents, four were from Virginia. Early in the century New England and the Middle States, except Delaware, prohibited slavery and the importation of slaves to the United States was forbidden. The spread of population to the West, especially after the discovery of gold in California, raised the question whether slavery should be permitted west of the Mississippi. Legislative compromises were made, but with the election of Lincoln on a "free soil" platform, South Carolina withdrew from the Union, followed by Alabama, Florida, Georgia, Louisiana, Mississippi and Texas, and a Southern Confederacy was formed. Lincoln was inaugurated 4 March 1861 and the Confederates began the war by firing on Fort Sumter, in Charleston Harbor, 12 April 1861. Both sides were sure that the war would be

over in a few months, as President Lincoln's call for 75,000 volunteers for 90 days and President Jefferson Davis' declarations demonstrated, but it lasted four years, costing some 600,000 lives and two billions of money, the most important war of history up to this time. The South, fighting on an interior line, was not only able to maintain the struggle, but to bring the North near to defeat. During the year from July 1862 to July 1863, the North won no victories. Then came the turning point at Gettysburg 3 July and Vicksburg 4 July 1863. Grant's forceful thrusts gradually wore down the Southern armies, Sherman's march to the sea deprived them of reserves of men and means, but it was not until 9 April 1865 that Grant and Lee met at Appomattox to arrange the surrender of the Army of Virginia and bring the war to an end. Peace was sadly marred by the assassination of President Lincoln at Ford's Theatre on Good Friday night, 14 April 1865. A generation later, when the Spanish-American War came, there was scarcely a trace of the old bitterness left.

Except for some Indian troubles due to flagrant abuses of the Indians by Indian agents and the whites who lived near them, the United States was at peace for a generation after the Civil War, until the war with Spain. This was brought on by Spanish misrule in Cuba, but was precipitated by the unfortunate blowing up of the *Maine*, a United States man-of-war, in the harbor of Havana 15 Feb. 1898. Congress was rushed into war by popular sentiment. The events of the war were the capture of Manila by Dewey (1 May) and the battle of Santiago (3 July) in which the Spanish fleet was destroyed. By the treaty of peace Cuba became a free country under the protection of the United States and Porto Rico and the Philippines came under United States dominion.

The dream of centuries was realized in the second half of the century in a united Italy under Victor Emmanuel II. The kings of Sardinia ruled over Savoy and Piedmont on the Continent and were ambitious to increase their territory and, above all, push the Austrians out of Italy. King Charles Albert was disastrously defeated at Novara (1849) and resigned his crown in favor of his son, Victor Emmanuel, who, under the influence of Cavour, sent 15,000 Sardinians, as they were called, to help France and England against Russia in the Crimean War. The understanding was that France would in return help Italy against Austria. Cavour promised Savoy and Nice to Napoleon to round out his French territory, and in 1859 the war between Austria, Italy and France broke out. After the battle of Solferino, Napoleon made peace with the Austrian emperor at Villa Franca, disappointing Cavour's plans, but largely increasing Victor Emmanuel's kingdom, the capital of which now became Florence instead of Turin as before. The most significant result of the battle of Solferino came from the presence there by chance of M. Durant of Geneva, who saw all the suffering of the wounded soldiers under the broiling sun. It gave him the idea of organizing an international non-combatant association for the relief of suffering on the battlefield. Out of this came the Red Cross organization which has meant so much not only for war but also for the emer-

gencies of peace ever since. Napoleon refused to permit the Pope to be disturbed in the possession of Rome and maintained a French army there. With the fall of Napoleon, however, during the Franco-German War in 1870, Sardinian troops under Garibaldi entered Rome and this became the capital of a united Italy, which has been growing in solidarity ever since.

Two extremely important features of the history of the century are the rise into prominence of the great British colonies, Canada, Australia, New Zealand and South Africa. All of them have made wonderful strides, comparable to those made in the United States. At the end of our American Revolution, Canada had about 70,000, while the United States had some 3,000,000 inhabitants. By the end of the 19th century, Canada had multiplied over 100 times in population, the United States less than 35 times. Canada as a colony suffered from colonial abuses and in 1837 there were two revolutions, one in Upper, the other in Lower Canada. They brought reforms. After the famine in Ireland, a great many Irish emigrants came to Canada, and with the increase of population the need of federation was felt. It was brought about 1 July 1867. The opening up of the Northwest Provinces and the discovery that the finest kind of wheat could be grown there attracted immense numbers of people and the thorough democracy of the government brought many new citizens. Canada seemed to be drifting toward absolute independence of the mother country until Canadian volunteers served in the Boer War, a forecast of the sacrifices to be made a little later in the Great War.

Australia, discovered by Captain Cook in 1770, was proposed as a colony for American Royalists after the Revolution, but the plan fell through. It became a convict station, but in spite of this grew rapidly in population until at the mid-century there were some 350,000 free inhabitants, about 200,000 in New South Wales, and 75,000 each in Victoria and South Australia. In 1851 came the discovery of gold by a gold miner from California. The male population rushed to the gold fields, leaving only women and children in the cities. Immigrants came in swarms, and in 10 years Victoria grew from 70,000 to 600,000 inhabitants. Fortunately, gold was discovered in other parts of Australia, and this diverted population to them. For 50 years the annual gold output was some \$50,000,000. Six independent colonies came into existence, but the rise of Japan, Germany's entrance into the south Pacific, European spheres of influence in South Africa and tariff troubles forced them into union. Their Constitution is an imitation of that of the United States and the site of the Federal capitol, centrally located in a city (Canberra) to be built for it, repeats the history of Washington. The Confederation of Australia made the great southern continent ready to play an important rôle in the 20th century. The Boer War showed its loyalty to the mother country and the Great War consecrated it in blood.

The last year of the century saw a severe blow to English prestige in the Boer War. The Dutch South African settlers, known as Boers, trekked from the British dominions at the Cape of Good Hope into the Transvaal, or cross-river country. They were living in peace when the discovery of gold led to a great influx of Uit-

landers (foreigners). The Boers refused to share the franchise except under rigid conditions, and Dr. Jameson (1895) led a raid to secure reform. President Kruger, instead of court-martialing the captured raiders, gave them up to the British, who treated them with leniency. Chamberlain, the English minister, seemed intent on forcing the Boers into war, thinking this the easiest way to end friction. Sir William Butler's warning of the danger of such a mistake was unheeded. A period of severe political tension ensued, and Britain found herself in a war which proved costly in life and treasure. The Zulu War and its disasters had not proved a lesson. A tactless English agent pushed Cetewayo, king of the Zulus, into a war (1878-79) easily avoided but extremely costly in men and in prestige. The Zulus, brave to desperation, inflicted severe losses. The young French Prince Imperial lost his life in one of their incursions. The Boers proved quite as brave and even more successful in fighting. The dogged courage of English troops, pushed to frontal attack, only sacrificed them to the bullets of an enemy, all sharpshooters, ready to take advantage of every mode of concealment and using smokeless powder, so that the English saw their comrades fall scarcely able to discover what to shoot at in return. The public feeling of the world ran strong against Britain. "She was unjustly oppressing a small nation and coveting valuable territory which did not belong to her." (Oscar Browning.) All the resources of the empire had to be mobilized against this little people, after a series of severe preliminary losses. There was one compensation. Volunteers from Canada, New Zealand and Australia served with the English troops, showing that colonial attachment to the mother country was strong. The war continued in desultory fashion until April 1904. England's subsequent treatment of a brave enemy is the redeeming feature of the event.

The greatest chapter in the century's history is that of the discoveries in science. Father Piazzzi's discovery on the very first morning of the century, of Ceres, the first asteroid recognized, was a portent of the century's scientific advance. Treviranus' use of the word "biology" for the first time the same year marks an epoch. Lamarck suggested not only a theory of evolution but its factors. Biology became dominant. Schleiden and Schwann demonstrated the existence of cells in all living things, plants and animals, showing a bond between them. The cell doctrine became the foundation of physiology and pathology. Virchow's work in cellular pathology furnished the basis for a scientific study of the internal causes of disease, while Pasteur demonstrated the existence of microbes as the extraneous etiology of infectious diseases. Pasteur's work made possible the development of sanitary science and an immense reduction in the death rate of cities. His discoveries furnished Lister with the principles of antiseptic surgery, with all that they meant for the saving of life and suffering. Before Lister, only a few emergency operations to save life were done, while now many serious operations could be performed for the relief of suffering and the prevention of complications.

The second half of the century was in scientific circles largely taken up with the dis-

cussion of the theory of evolution. Independently Charles Darwin and Alfred Wallace hit upon the theory of natural selection as affording an explanation for the evolution of living beings. Darwin's book the 'Origin of Species' (1859), which Darwin himself would have preferred to call by its secondary title, 'The Preservation of Favored Races in the Struggle for Life,' for it discusses not origins but preservations, at once became the storm centre of discussion for scientists and theologians. There was a tendency to exaggerate what was called Darwinism, so that the second decade after the publication of Darwin's book came subsequently to be known as the "silly seventies." Huxley in 'The Coming of Age of The Origin of Species' (1880) reminded the world that so long as species were infertile with each other the missing link would continue to be a mystery. Abbot Mendel's discovery of a series of laws of heredity led biology from theory to observation once more, but preoccupied with evolution theories the significance of his work was not recognized until the end of a generation. Weismann's demonstration that acquired characters are not inherited left the subject of evolution in the air at the end of the century.

The purely physical sciences entered an era of great development. In 1846 a new planet, Neptune, was discovered by Leverrier at Paris and Charles Adams at Cambridge, through mathematics alone from the study of the variations of Uranus, which had been discovered by Herschel (1781). This was a great triumph for applied mathematics and with the development of astronomical spectroscopy which demonstrated that the universe was composed of materials with which we were familiar on earth gave a new confidence to students of science. The doctrine of the conservation of energy was demonstrated by Joule, Mayer and Helmholtz. Electricity was developed marvelously by Davy, Faraday, Clerk Maxwell and Lord Kelvin, who left imperishable monuments of successful research. Sir William Crookes' studies of radiant matter stimulated research in radiation and led to the discovery of the X-rays (Roentgen 1895) and of radium and the radio-active substances. Madame Curie's discovery proved valuable for physics as well as for medicine and surgery. The study of radiation opened up a new and wonderful chapter in chemistry and led to developments in chemical physics which revolutionized ideas as to the constitution of matter. Chemistry made the waste material of factories the source of valuable by-products. Coal tar yielded up the dyes and drugs which had been stored in prehistoric plants, the original discoveries in this field being made by the English and exploited by the Germans. Illuminating gas banished darkness and was succeeded by electricity which effected a revolution by which night was almost turned into day. Night life developed in the great cities and made great social changes. Men worked by day and could play far into the night, but the increase in insanity and suicide became alarming.

The 19th was above all the century of inventions. These concerned chiefly the transportation of the human body and human thought. The locomotive, the steamboat, electric motor appliances, the electric telegraph, the telephone and finally wireless telegraphy with the evolution of printing were all phases of

this movement. The development of bridges, tunnels, canals, were complements and the elevator and electric light supplemented the work. Photography was a phase of printing. After the solution of the transportation problem the most important inventions were destructive agencies. The rifling of fire arms, the machine gun, smokeless powder and high explosives seemed to promise to make war impossible and Alfred Nobel, the inventor of dynamite, under that impression established his peace prize. The steel bridge naturally suggested the steel building frame, the under water tunnel the use of caissons for deep foundations for high buildings. Applications of steam and electricity made labor-saving machinery possible, though John Stuart Mill declared that instead of saving human labor machinery added to the drudgery of mankind. The discoveries of science were all made available for the convenience and comfort of mankind. The great mass of men were not in a position however to enjoy them.

In literature the classical and didactic 18th century gradually gave way before the romantic early 19th, though not without a struggle. Percy's 'Reliques' aroused Sir Walter Scott first to romantic poetry and then to be the founder of a great movement in fiction, which had for moving spirits men like Manzoni, Dickens, Thackeray, George Eliot and Victor Hugo. America contributed two of the greatest fiction writers, Hawthorne and Poe. A really great period of fiction ran out in trivial realism. Dramatic literature followed the same course and though there was great theatrical development little that is expected to live was written in the field of drama. In poetry Wordsworth, Keats, Shelley, Byron, Coleridge, Longfellow, Whitman and Tennyson achieved reputations, some of which have endured though many of the literary lights of the period have already been extinguished by time.

The art of the 19th century began under classic influences in France encouraged by Napoleon, but the romantic movement in literature affected art also and the latter half was dominated by the Barbizon school, whose work is recognized as of enduring value. François Millet is one of the great painters of all time, though he nearly starved while doing his work. He has left a magnificent monument in his pictures of present life which are at the same time human documents of great significance. Some of his colleagues did work of only less import. Etching, with Haden, Whistler and Zorn, had a fine revival in the latter part of the century; the decorative arts came into their own once more and the arts and crafts derived a new stimulus from the more careful study of Renaissance and mediæval models.

The outstanding religious event of the century was the Oxford movement which Newman dated from a sermon of Pusey's in 1833. The younger generation at Oxford, hoping to bring the Church of England back to primitive Christianity, published a series of 'Tracts for the Times,' hence the term Tractarian Movement which drew wide attention. They continued from 1833 to 1841. It was felt, however, by the great majority of Anglican churchmen that the movement was out of sympathy with the Anglican Church and in 1845 the

chief figure among the leaders, John Henry Newman, became a convert to Catholicism. He took part in the foundation of a Catholic University at Dublin in the early fifties and later was made a cardinal.

The outlook for humanity at the end of the century was not promising. There were so many abuses in the social order that it seemed almost certain that severe internal troubles in many countries in the form of an uprising of labor against capital must occur before there could be any assurance of the end of discontent. A great part of the laboring population was not receiving a living wage, that is, such wages as would enable them to live decently and support their families properly. Prosperity in the sense of the accumulation of national wealth in many countries was very great, but there was an extremely unequal distribution of the wealth, so that a few families rolled in luxury and the great majority of the people, some of them having to work very long hours in extremely unsuitable conditions, were so poorly paid that they had to live in circumstances unworthy of civilization. Investigations conducted by Booth in London in the early nineties, showed that about 1,000,000 of people, nearly one in three of the population, were unable to obtain the necessities for healthy living. In many districts more than half the population were in distress or on the verge of it. London was said to be exceptional because of its overcrowding and the hard times were blamed for unfortunate conditions, but when Rountree made a careful survey of York in 1899 he found the people of that provincial town in nearly as bad a condition as that reported for the capital, though that year trade was unusually prosperous. More than one in four of the population was found to be living in poverty though the fixed standard of family wages below which the poverty line was drawn was only 21 shillings and 8 pence per week, just about \$5.25. Conditions were worse on the Continent. The United States Daily Consular Reports at the close of the century declared that of 2,000,000 of people in Berlin, 1,125,000 had an income, but nearly one-half of the incomes were exempt from taxation because they were below \$214 per year. Of the 600,000 taxed incomes, nearly 550,000 were less than \$700 a year, that is about \$2 a day. Conditions were better in America and yet many of our working people were compelled to live huddled together in slums under intolerable conditions, while a few enjoyed luxuries.

Spahr in 'An Essay on the Present Distribution of Wealth in the United States,' estimated (1896) that 125,000 families of the wealthy class in the United States held \$33,000,000,000 of the total wealth of the nation, while 5,500,000 families of the poorer class had altogether but \$800,000,000. Of every 100 families one possessed more than the remaining 99 put together. The industrial era culminated in the creation of monopolies and trusts in which men, sometimes by good luck, but oftener by illegal or unjust means, amassed vast fortunes, which when distributed by will served, as a rule, to do much more harm than good. Social unrest and threatening social revolution were impending at the beginning of the 20th century. The spirit of the French Revolution had made

itself felt all during the century. Its main purpose, to quote Hilaire Belloc, was to gain back for the lower classes, so-called, the rights which they had enjoyed in the Middle Ages. The proletarians that is, in the original sense of the word, the child raisers of the race, struggled all during the century to secure the essential rights of humanity, the rights, to use Carlyle's expression, to have what is not denied to the animals, proper nutrition and shelter for themselves and their offspring. At the end of the century better things seemed impending.

There remained, however, a number of political problems unsolved which boded ill for the time to come. In spite of more than 100 years of supposed denationalizing, the Poles were still intent on freedom with no prospect of an end to serious trouble in North Central Europe until Polish national feelings were satisfied. The age-long feud between the Irish and the English was active as ever, the source of serious friction between the two peoples. The Tsar broke the promise of his dynasty that the language and certain national rights of the Finns should be respected. In Bohemia the Czechs were in ever-increasing turmoil with the Germans and Austria was a seething cauldron of national disquiet with nearly a dozen nationalities claiming rights which the ruling caste was not willing to grant them. Finally there was *Italia irredente*, portions of Italy still held by Austria, and Alsace-Lorraine which had been taken by the Germans, but had not become Germanized during the generation. All these problems were clamoring for solution and could not be eliminated as political trouble factors until solved with right and justice.

JAMES J. WALSH,

Author of 'The Thirteenth, the Greatest of Centuries,' etc.

PRINCIPAL EVENTS OF THE NINETEENTH CENTURY.

1801. Piazzi discovers the planetoid Ceres, 1 January. Napoleonic wars continue. Battle of Alexandria, Egypt, 21 March. Battle of Copenhagen. British destroy the Danish fleet, 2 April. Peace treaty between France and Great Britain, 1 October. War between the United States and Tripoli.
1802. Napoleon re-establishes Christianity in France, 2 March. Treaty of Amiens signed, 27 March. Dr. Olbers discovers planet Pallas, 28 March. For the discovery of vaccination, British Parliament awards Dr. Jenner \$50,000. Treviranus enunciates the principles of biological development. Napoleon named consul for life, July. Prince of Orange abdicates, August.
1803. War renewed between England and France, 16 May. War in India. Scindia defeated, 10 August. The Great Mogul of Delhi deposed, September. Haiti, French negro colony, achieves independence, 19 November. France sells Louisiana to the United States.
1804. Napoleon proclaimed emperor, 20 March. Duke d'Enghien shot, 21 March. Code of Napoleon first promulgated. Francis II abandons title of emperor of Germany, and assumes that of emperor of Austria. Lewis and Clark expedition.
1805. War declared between England and Spain. Napoleon crowned king of Italy, 26 May. British defeat French and Spanish fleets, 22 July. Napoleon restores Gregorian calendar in France. Battle of Trafalgar and death of Nelson, 21 October. Battle of Austerlitz, 20 December. Peace between Tripoli and United States.
1806. Cape of Good Hope occupied by the British, 8 January. Burr's conspiracy. Confederation of the Rhine. Saxon Bavaria and Wurtemberg become kingdoms.
1807. Peace of Tilsit. British again bombard Copenhagen, 7 September. French occupy Portugal; the royal family emigrates to Brazil, 29 November. Fulton's first steamboat starts the great development of marine travel of the century. Slave trade abolished.
1808. Napoleon proclaims blockade of Great Britain. French occupy Rome. Murat made king of the Two Sicilies. Joseph Bonaparte king of Spain. Spain declares war

- against France, 1 May. Finland surrenders to Russia, 7 November.
1809. Battle of Wagram. Battle of Corunna. British destroy French fleet in Basque roads.
1810. Rebellion in Mexico. Napoleon divorces Josephine and marries Maria Louisa of Austria. Peace between France and Austria. France annexes Holland. Bernadotte becomes Crown Prince of Sweden.
1811. Indian war in West. Mamelukes massacred at Cairo. British take Java.
1812. Napoleon's disastrous invasion of Russia. War between United States and England. Spanish Peninsular campaign.
1813. United States troops invade Canada. Perry's victory on Lake Erie. Russia, Prussia and Bavaria confederate against France. Spain abolishes the Inquisition. Revolution in China. British victories in Spain. Napoleon defeated at Leipzig.
1814. British troops burn capital at Washington. British under Wellington invade France and capture Bordeaux. Allied sovereigns enter Paris. Napoleon abdicates and is exiled to Elba. General treaty of peace. England acquires Cape of Good Hope, Malta, Mauritius, Tobago and Saint Lucia. Norway annexed to Sweden. Peace signed between England and America.
1815. Battle of New Orleans and British defeat. Napoleon escapes from Elba. The 100 days campaign ends with the battle of Waterloo. Napoleon exiled to Saint Helena. Holy Alliance established. Americans suppress Algerian piracy. Brazil made an empire. Lamarck propounds the theory of evolution.
1816. British fleet destroys Algiers.
1817. Bolivar becomes dictator of Venezuela.
1818. Chile achieves independence.
1819. Colombia proclaims a republic. Purchase of Florida. Steam navigation begins between Europe and America.
1820. The Missouri Compromise. Rebellion in Spain. Death of George III of England. Austrians suppress Italian Carbonari. Meeting at Troppau of sovereigns of Russia, Austria and Prussia. First king of Haiti commits suicide.
1821. Mexico, Colombia, Venezuela and Ecuador proclaim republics. Greek war of liberation. Napoleon dies at Saint Helena.
1822. Brazil separates from Portugal. Greece strikes for freedom. Constitutionalists triumph in Spain, but are condemned by the Congress of Verona. Liberia founded by American Colonization Society.
1823. The Monroe Doctrine formulated. French army invades Spain and suppress the Constitutionalists.
1824. Argentina gains independence. Peru is made free by Bolivar. War between England and Burma. English acquire Singapore.
1825. Erie Canal completed. Gas used for lighting New York streets. Drummond invents the limelight. Bolivia becomes a republic. Steam railroad development begins with the opening of the Stockton and Darlington line in England 27 September.
1826. War between Russia and Persia. Great Britain and United States arbitrate on damages for the War of 1812.
1827. Treaty of London creates the kingdom of Greece. Turkish-Egyptian fleet destroyed at Navarino by the allied fleets.
1828. Greece gains independence. Uruguay becomes a republic. Russia effects peace with Persia, and declares war against Turkey.
1829. Peace treaty between Russia and Turkey. Spain attempts to recover Mexico. Venezuela separates from Colombia.
1830. Revolt in Paris. Separation of Holland and Belgium. France conquers Algiers. Revolution in Poland.
1831. Polish rising defeated. Brazilian revolution. Reform bill introduced into British Parliament. The Abolition movement acquires importance in the United States.
1832. Black Hawk War. Nullification in South Carolina. Reform bill passed in England. Abd-el-Kader leads Arabs against French occupation of Algiers.
1833. Migrations of the Boers begin. Abolition of slavery in the British colonies. American Anti-slavery Society founded. Carlist insurrection in Spain. Civil war in Portugal. Royal fleet defeated by insurgent fleet. Treaty of peace and alliance between Turkey and Russia.
1834. Quadruple alliance of England, France, Spain and Portugal. Education in England receives its first parliamentary grant.
1835. The second Seminole War. Texans revolt against Mexican rule. Conference of Topitz between the emperors of Russia and Austria and the king of Prussia. Halley's comet reappears.
1836. The Alamo massacre. Texas gains independence and proclaims Houston President. Revolts in Spain and Portugal.
1837. Chicago incorporated as a city. Financial crisis in the United States. Rebellion in Canada. Queen Victoria ascends the British throne.
1838. Peru proclaims independence. International Copyright Act passed. *Great Western* steamship makes her first transatlantic voyage. Daguerre introduces photography.
1839. Gold found in Australia. Central American confederacy dissolves. Egyptian forces defeat Turkish army and acquire its fleet. Russia wars successfully in Caucasasia; disastrously against Khiva. Anglo-Indian force invades Afghanistan. Anti-Corn Law and Chartist agitations in England.
1840. Penny postage inaugurated in Great Britain. Marriage of Queen Victoria to Prince Albert of Saxe-Coburg. Revolt in Syria. Occupation of Acre and Beirut by British and Austrian expedition. Peace established by the Treaty of London. Opium war between England and China.
1841. Union of Upper and Lower Canada. Successful revolt of the Afghans against British rule.
1842. British disasters in Afghanistan. Khyber Pass massacre. Dorr Rebellion in Rhode Island. Seminole War ends. Maine boundary settled by Ashburton Treaty. British punitive expedition reoccupies Afghanistan and retires. Treaty of Nanking opens Chinese ports to British commerce. Boer Republic in Natal occupied by the British.
1843. Irish Home Rule and Repeal agitation under O'Connell. Free Church formed in Scotland. Scinde captured by the British. Thames tunnel opened. Botta discovers site of Nineveh.
1844. Electric telegraphy is practically developed. French subdue Algiers and Morocco. United States and France make treaties with China. Santo Domingo establishes a republic.
1845. Texas admitted to the Union. Mexico declares war with the United States. British war with the Sikhs in India.
1846. Defeat of Mexico. Occupation of California and New Mexico. Repeal of the English Corn laws. New Zealand acquires constitutional charter. Great Irish famine, and large emigration to the United States. Leverrier and Adams by applied mathematics discover the planet Neptune.
1847. War between Mexico and the United States. Mexican capital captured. Jesuits expelled from Switzerland. Salt Lake City founded by the Mormons.
1848. Gold discovered in California. Revolution in France; republic proclaimed; Louis Napoleon becomes President. Risings in Italy, Germany, Austria, Hungary, Denmark, Poland and Ireland. War between Italy and Austria. Second Sikh War in India. British occupy the Orange River State. Boers migrate and establish Transvaal Republic.
1849. Gold miners rush to California. Prussia defeats Danish attack on Schleswig-Holstein. Austrians suppress Hungarian revolt. Also the Italian revolt. French army restores the papal temporal power in Rome. British conquer Sikhs and annex Punjab. Livingstone discovers Lake Ngami.
1850. Russia starts its career of conquest in Asia. German Confederation becomes effective. Clayton-Bulwer Treaty between the United States and Great Britain provides for transisthmian canal. Taiping Rebellion in China. McClure discovers Northwest Passage.
1851. *Coup d'état* in France; Louis Napoleon elected president of the Republic for 10 years. The Great Exhibition in London.
1852. Empire restored in France. Napoleon III proclaimed emperor. British war with Burma and annex Pegu. Buenos Aires secedes from Argentina. Opening of Japan.
1853. Russo-Turkish War. Revolution in Mexico. The Taipings take several Chinese cities.
1854. The Crimean War. Commercial treaty between the United States and Canada. Commodore Perry effects a treaty between Japan and the United States. The Orange River Republic is established.
1855. Walker's filibustering expedition to Nicaragua. Fall of Sebastopol to the allies. Capitulation of Kars to the Russian forces. Bessemer steel process patented. Transisthmian Panama Railway opened. Zambesi Victoria Falls discovered by Livingstone.
1856. Settlement conflicts in Kansas. Crimean War ends. Britain annexes Oudh. British wars with Persia and China.
1857. The Indian Mutiny. France and England invade China. Business panic in the United States.
1858. Great Britain suppresses the mutiny and annexes India. China defeated, makes treaties with England, France and other powers, and cedes Amur to Russia. First Atlantic submarine cable laid. Evolutionary theory of Darwin and Wallace announced.
1859. The John Brown raid at Harpers Ferry. Franco-Italian War with Austria. Austrians defeated at Magenta and Solferino. Treaty of Zürich ends war and Italy acquires Lombardy. Livingstone extends exploration in Africa.
1860. Oil wells discovered in Pennsylvania. Abraham Lincoln elected President of the United States. South Carolina secedes. Anglo-French War with China and

- occupation of Peking. Garibaldi's campaigns in Italy. French occupy Syria after massacres of Christians. Spain wars with Morocco and acquires Tetnan.
1861. Civil War in United States commences. Victor Emmanuel becomes king of Italy. Russian serfs freed. Austrian Empire receives a new constitution. France, England and Spain send fleets to Mexico to enforce claims.
1862. British government demands release of Mason and Slidell, Confederate commissioners, taken from the British steamer *Trent*. Numerous battles fought between Northern and Southern forces. First battle of ironclads in Hampton Roads. France declares war against Mexico. France acquires Cochinchina. In expedition against Rome, Garibaldi is defeated, wounded and captured.
1863. Civil War in United States continues. Emancipation of slaves proclaimed. Poles unsuccessful revolt against Russia. France conquers Mexico, proclaims an empire with Maximilian of Austria as emperor.
1864. Civil War in the United States continues. Austro-Prussian War with Denmark ended by the Treaty of Vienna. Russia conquers Circassia. Spanish-Peruvian War. The Taiping Rebellion in China suppressed.
1865. Civil War ends in United States. Lincoln assassinated. Crank and pedal bicycle invented. Mendel's theory of heredity established. Fenian Rebellion in Ireland. War between Paraguay and Argentina. Alliance between Argentina, Brazil and Uruguay.
1866. Fenians from United States invade Canada. Prusso-Italian forces defeat Austria; treaties of Prague and Vienna effect peace. Venetia united to Italy. German Confederation dissolved. North German Confederation formed. Spain attacks Chile and Peru and bombards Valparaiso and Callao. Second and successful Atlantic cable laid.
1867. Purchase of Alaska by United States. Maximilian shot in Mexico. Abyssinian War with England. Suez Canal opened to navigation.
1868. Revolution in Spain, Royalists defeated. Insurrection in Cuba. Shogunate of Japan overthrown. Defeat of Paraguay.
1867. The Pacific Railway completed. General Grant becomes President of the United States.
1870. Franco-Prussian War; German Empire formed. Napoleon III deposed; France becomes a republic. Italy annexes Papal States. Mont Cenis tunnel completed.
1871. William I proclaimed emperor of Germany at Versailles. The war of the Commune in Paris. Emancipation of slaves in Brazil. Disastrous fire in Chicago. Dry plate photography introduced.
1872. Geneva Convention settles *Alabama* claims in favor of the United States. Germany expels the Jesuits. British Parliament passes the Ballot Act. Revolution in Spain.
1873. Spain forms a republic when King Amadeus abdicates. Egypt receives autonomy. Ruma occupies Khiva. British expedition subdues Ashantis.
1874. *Coup d'état* in Spain and Alfonso XII proclaimed king. Great Britain annexes Fiji Islands.
1875. Great Britain acquires control of the Suez Canal. Carlist revolt in Spain suppressed. Egyptian-Abyssinian War.
1876. Centennial Exposition at Philadelphia. Sioux War. Custer massacre. Bell's telephone introduced. Ruma annexes Khokand. Turkish atrocities in Bulgaria. Queen Victoria proclaimed empress of India. Abyssinians defeat Egyptians. Kaffirs defeat Transvaal Boers.
1877. Diaz becomes President of Mexico. Japanese Samurai revolt suppressed. Russo-Turkish War. British annex Transvaal Republic. Stanley descends Kongo River and crosses Africa. Edison invents phonograph.
1878. Russians occupy Adrianople. British fleet steams through the Dardanelles to stem Russian advance, and British forces occupy Cyprus. European situation adjusted by Treaty of Berlin. Russian embassy received, British embassy rejected by Afghans, British troops enter Afghanistan and place Yakub Khan on the throne. Half-tone process revolutionized; engraving methods.
1879. British Ambassador and suite massacred at Kabul. British expedition avenges deaths and restores prestige. Specie payment resumed in United States. Chile wars against Bolivia and Peru. Zulu War in South Africa.
1880. Partition of Africa begins. France annexes Tahiti. Spain abolishes slavery in Cuba. Chinese coolie immigration restricted in the United States. Transvaal revolt against British suzerainty.
1881. French begin digging Panama Canal. Assassination of President Garfield. British defeated by Boers who win independence. French protectorate over Tunis. Revolt in Egypt under Arabi Pasha. Assassination of Alexander II of Russia.
1882. Murder of Lord Cavendish and secretary in Phoenix Park, Dublin. Europeans murdered in Egypt. Bombardment of Alexandria followed by British control of Egypt. French Tonquin expedition. Anti-polygamy bill enacted in United States. Pasteur isolates hydrophobia bacillus. Koch isolates tuberculosis bacillus.
1883. Civil service bill passes Congress. Brooklyn bridge opened. French protectorate established in Anam. French aggression in Madagascar. The Mahdi annihilates Egyptian army led by Hicks Pasha.
1884. Russia annexes Merv. War between France and China. Convention between Great Britain and the Transvaal Republic.
1885. The Mahdi captures Khartum and General Gordon is killed as British troops near city. Revolt in Canada; Riel, the leader, captured and hanged. Russo-Afghan-Indian difficulties settled by British concessions. War between England and Burma. War between Serbia and Bulgaria. Kongo Free State established.
1886. Earthquake at Charleston. Anarchist riots at Chicago and Milwaukee. Great Britain annexes Upper Burma. Greece threatens Turkey. Great powers blockade Greek ports. Talking machine perfected.
1887. Centenary of United States Constitution celebrated. Queen Victoria's jubilee celebration. Neutrality of Suez Canal confirmed. Great Britain annexes East Zululand. Stanley's second expedition through Africa.
1888. William II becomes emperor of Germany. Boulangerist agitation in France. Chinese Exclusion Act in United States. Canadian Fisheries Treaty signed in Washington. Retaliatory measures against Canada advocated by President Cleveland creates stir. Abyssinians defeat Italians. Imperial British East Africa Company is chartered. Hertzian waves developed.
1889. Flood devastates Johnstown, Pa., with loss of over 2,250 lives. Japan inaugurates a new constitution. Brazil revolts, proclaim a republic and exiles Dom Pedro. British South Africa Company is chartered. Automobile improved and becomes of practical use.
1890. Heligoland transferred by Britain to Germany in return for African concessions. McKinley tariff bill becomes law. Linotype printing improved and adopted.
1891. Revolution in Chile. Australasian federal convention at Sydney. Triple alliance renewed for six years.
1892. Bering Sea Treaty ratified. Saint John's, Newfoundland devastated by fire. French forces occupy Dahomey, Panama scandals in France.
1893. Chicago's Columbian Exposition, World Fair and Parliament of Religions. French ultimatum to Siam. South African War opens Matabeleland. Rio Janeiro bombarded by Brazilian rebels. Business depression in United States. Edison invents kinetoscope.
1894. Chino-Japanese War. British establish protectorate in Uganda. Dreyfus falsely convicted of treason against France. President Carnot of France assassinated. Great railway strike in Chicago.
1895. Treaty of Shimomoseki ends Chino-Japanese War. French campaign in Madagascar. Abyssinians defeat Italians. Cuba revolts against Spain. Jameson's abortive raid in the Transvaal. President Cleveland's Venezuelan message. Roentgen X-rays discovered.
1896. British forces occupy Ashanti. Anglo-French Siamese complications settled. General Weyler's suppression measures in Cuba increases revolt. Italy's disastrous defeat at Assua ends war with Abyssinia. France annexes Madagascar. Anglo-American agreement over Venezuelan difficulty. Wireless telegraphy practically developed by Marconi.
1897. Diamond jubilee of Queen Victoria. United States rejects Olney-Pauncefote Treaty. Gold rush to Yukon commences. Famine and pestilence in India. Greek action in Crete precipitates intervention, war with Turkey and defeat. Canada introduces differential tariff bill.
1898. United States battleship *Maine* blown up in Havana harbor. Spanish-American War. Annexation of Hawaii. Occupation of the Philippines, Cuba and Porto Rico. Treaty of Paris ends Spanish-American difficulties. The "Dreyfus affair" agitates France. Khalifa defeated at Omduram and Sudan reoccupied. Fashoda affair complicates Great Britain and France. Peace conference at The Hague. China leases Port Arthur and Dalny to Russia. Chile and Argentina agree to perpetual peace and arbitration. The Curies discover radium.
1899. The Philippines revolt against United States rule. Hostilities in Samoa. Boers invade Natal and the South African War begins.
1900. The Hay-Pauncefote Treaty facilitates construction of the transisthmian canals. Great Britain annexes the Transvaal and Orange River republics. Boxer Rebellion in China; siege and relief of the foreign legations. Russia occupies Manchuria. Australia becomes a commonwealth.

NINETY-SIX, Fort, a former Revolutionary fort in Abbeville County, S. C., near the Saluda River. It was so-called on account of being 96 miles from the frontier fort of Prince George. During the Revolutionary War it was held by Lieutenant-Colonel Cruger and 500 men for King George. General Green laid siege to

it and attacked it on 25 May 1781, and had seized the outlying works, when sometime after it was reported that Lord Rawdon with 2,000 men had arrived at Charleston and was marching to its relief. Green accordingly pressed home his attack, but was unsuccessful, and the reinforcements arrived on 21 June; but Rawdon was ultimately, through Green's Fabian tactics and danger to his communications, forced to abandon the fort.

NINETY-THREE ('Quatre-Vingt-Treize'), a novel by Victor Hugo, published in 1874. It bears the sub-title 'Premier Recit. La Guerre Civile,' and was intended to form the first part of a trilogy. The edition of 1882 contains several remarkable designs signed by the author. The story deals with the French Revolution and the civil war in La Vendée.

NINEVEH, nīn'ē-vē, the ancient capital of the Assyrian Empire. The site of the city, which was destroyed about 606 B.C. by the Babylonian Nabopolassar and the Mede Cyaxares, has been identified with the modern Kouyunjik. It stands on the left bank of the Tigris, opposite to the town of Mosul. The first historic notice of Nineveh is in Genesis x; it is described as "a great city" in the time of the prophet Jonah (8th century B.C.). Ezekiel at the beginning of the 5th century B.C. speaks of its desolation in the most vivid imagery. "The Assyrian was a cedar in Lebanon, with fair branches"; "All the trees of Eden that were in the garden of God envied him"; and "strangers, the terrible of the nations, have cut him off"; "upon the mountains and in all the valleys his branches are fallen and his boughs are broken by all the rivers of the land; and all the people of the earth are gone down from his shadow and have left him."

It was known to travelers that vast mounds covered the banks of the Tigris opposite Mosul and extended to a considerable distance inland. They were long considered to cover the ancient site of the Assyrian capital, but it was not until 1841 that M. Botta, the French consul at Mosul, began excavations with the result that he obtained a few fragments of brick and alabaster. He renewed his efforts at Khorsabad, 12 miles to the northeast, in 1843 and discovered an Assyrian edifice which had remained buried in the sand for thousands of years. The work was continued by Layard, who explored the lofty mounds of Nimrūd, situated 18 miles south-southeast of Mosul at the point where the tributary Zab joins the Tigris. This was the beginning of a series of the most remarkable discoveries. He immediately came upon numerous slabs covered with cuneiform inscriptions of unique importance. A chamber in the ancient ruins was lined with these, and they were found to be in excellent preservation. He unearthed, moreover, gigantic figures of various kinds—winged bulls and lions with human heads and winged sphinxes, which stood as guardians at the gates of stately palaces. It was evident that the old city had been destroyed by fire, for the stone images in many cases were calcined and crumbled into dust on exposure to the air. The fire had not, however, desolated what the explorer designated the northwest palace. Here he discovered in excellent preservation 28 rooms, decorated with bas-reliefs, carvings and moldings which told the

tale of the art and civilization which had flourished at Nineveh in its palmy days. Returning to Kouyunjik, Layard met with even more important results from his excavations. When he pierced the mounds at this point he was enabled to explore nine vast rooms, one of them 130 feet long, and all replete with interesting and valuable sculptures, inscriptions and carvings. In 1849, after returning to England and arousing the interest of the learned world in his magnificent discoveries, he renewed his work at Kouyunjik and found an almost inexhaustible treasury of antiquities in the sand mounds of the plain. He was now acting as agent for the British Museum, whose Assyrian collection he enriched with some of its most precious examples of art and inscriptions. Loftus and Hormuzd Rassam continued the work in 1853 and 1878-82, and the excavations at Nimrūd were renewed by George Smith in 1873. Wallis Budge in 1888 and L. King in 1902 have continued the work of excavation.

There can be no doubt that some of these monuments represent the remains of ancient Nineveh and scholars have arrived at the conclusion that the city of Ninus occupied the site of Kouyunjik and Nebbi Yunus on the left bank of the Tigris at the confluence of the Zab. Asur, an even earlier capital of Assyria, was undoubtedly built on the site of the modern Kalah Sherghat. The palaces of Sennacherib and Assurbanipal have been unearthed from the mounds of Kouyunjik, and a second palace of Sennacherib and Esarhaddon from the mounds of Nebbi Yunus. It is concluded from these discoveries by some archaeologists that Nineveh proper was one of a cluster of cities and royal residences that stood on the banks of the Tigris. Nineveh proper was built in the shape of an irregular trapezium. The palace of Sargon at the northern angle had a façade 400 yards in width. The chief sculptures and inscriptions which are now stored in the British Museum belong to palaces and temples in the northwest of the city. The principal palace was built in the 9th century B.C. by Assurnasirpal. Near by he built a great tower, rising with narrowing stages. His son Shalmaneser II built the central palace of the group. The statue of Nebo in the British Museum was brought from what has been called the southeast palace, but was really a temple.

Nineveh was not the earliest capital of Assyria and only came into importance in the time of Sennacherib, who is recorded on the inscribed bricks to have built its walls. From his time it was the chief seat of empire, and may have given its name to the whole group of cities between the Tigris and the Zab. Hence Jonah describes this Nineveh as a city of three days' journey, and Diodorus declares its circuit was 480 stadia.

Consult the works of Layard, Botta, Rassam, Flandin, Oppert and George Smith; also Hilprecht, 'Exploration in Bible Lands in the 19th Century'; Hogg, 'Recent Archaeology' (Philadelphia 1903); Kaulen, 'Assyrien und Babylonien' (Freiburg 1899); Perrot and Chipiez, 'Art in Chaldea and Assyria' (London 1884); Rawlinson and Pinches, 'The Cuneiform Tablets in the Kouyunjik Collection of the British Museum' (ib. 1889-99), and the 'Guide to the Assyrian Antiquities of the British Museum.'

NINEVEH, Va., Cavalry Engagement at. After the battle of Cedar Creek (q.v.) in Virginia, General Sheridan on 9 Nov. 1864 withdrew his army to Kernstown, and General Early followed him as far as Middletown. Sheridan ordered Torbet, commanding his cavalry, to move on Early at noon of the 12th, Merritt's and Custer's divisions to the right, on the Back and Middle roads, against Rosser, and Powell's division to the left, on the Front Royal road, against Lomax. Powell moved down the road as directed, and thence across toward Middletown, and at Nineveh met McCausland's cavalry brigade, which charged him; but he made a counter-charge and routed it, capturing two guns, three wagons, two battle-flags, and 161 prisoners, and pursuing eight or nine miles up the Luray Valley. Six regiments were engaged on either side. The Union loss was two killed and 15 wounded; the Confederates lost 20 killed and 35 wounded. Meanwhile the column on the right drove Rosser across Cedar Creek, and under cover of the night Early again retreated up the valley to New Market. Consult 'Official Records,' Vol. XLIII; Pond, 'The Shenandoah Valley in 1864.'

NINGPO, nǐng'pō', China, a city and treaty-port in the province of Che-Kiang, in a fertile plain on the left bank of the Takia or Ningpo River, 13 miles from its mouth, and about 100 miles south of Shanghai. It was opened to foreign trade by the Treaty of Nankin in 1842. It is surrounded by walls five miles in circuit, 25 feet high and 15 feet wide at top, and, besides, has extensive suburbs outside. Though highly extolled by the Chinese as one of the most beautiful cities of the Celestial Empire, it consists of narrow filthy streets and one-storied houses, sometimes of stone, but mostly of brick. Its most remarkable edifice is a brick tower, formed of seven stories, and above 160 feet high, but now a mere ruin, and it contains numerous temples, colleges, etc., chief among them the temple of the Queen of Heaven founded in the 12th century, but the present building, elaborately and richly ornamented, dates from 1680. Shops and immense store-houses occupy the quarters near the river, while eating-houses and tea shops abound near the gates and in the suburbs. The manufactures consist chiefly of silk and cotton goods, carpets, furniture, salt, etc. The fisheries are important. The principal exports are tea, silk and raw cotton; and the principal imports, besides manufactured goods, sugar and opium. The great bulk of the trade is carried on with the other treaty ports. Ningpo was the site of a Portuguese settlement in 1522, has been an important missionary centre, and was taken by the British without resistance in 1841. Pop. estimated at 450,000.

NINIAN, nín-ī-an, Saint, the apostle of the southern Picts. He labored in evangelizing northern England and southern Scotland at the end of the 4th and the beginning of the 5th centuries. He was a Briton by birth, but had been thoroughly educated in language and philosophy at Rome. The field of his activity extended as far north as the Grampian Hills, and his see church, dedicated to Saint Martin of Tours, was Candida Casa, now Whithorn, the modern Wigtonshire, the southwestern county

of Scotland. His death is placed by hagiologists in 432 and his festival is 16 September. After his death the Picts relapsed into paganism; but after the revival of Christianity under David I the shrine of the saint at Whithorn became a famous place of pilgrimage. Consult the biography by Ailred of Rievaulx, printed in Forbes' 'Historians of Scotland' (1875).

NINIGRET, an American Indian sachem of the Niantics, one of the Algonquin tribes. In 1637 he assisted the colonists in the Pequot war; and in 1647 began a war against the Mohegan, which was concluded by a peace at Boston. In 1667 he sold much of his land on Long Island to the colonists. He refused to allow Christianity to be preached to his people, saying "Go make the English good first." He died in 1677.

NIÑO, Pedro Alonso, pā'drō ā-lōn'sō nē'ñō, Spanish navigator: b. Moguer, Spain, about 1455; d. about 1505. He piloted one of Columbus' ships in the expedition of 1492, and accompanied him on his third voyage in 1498 to Trinidad and the coast of Paria, and returned to Spain filled with the project of making an expedition to the new country in search of treasure. He was granted the royal permission, one-fifth of the spoils to be the share of the Crown. The voyage was a successful one; he peaceably obtained from the Indians a great store of treasure, but was accused of withholding the share belonging to the king and died before the suit was ended.

NINON DE L'ENCLOS, nē-nōn dē lōn-klo, or LENCLOS. See LENCLOS, ANNE.

NINTH CENTURY. The crowning of Charlemagne in Rome by the Pope (800), and his magnificent constructive administration and ability as a lawgiver for the Empire of the West promised greatly for the 9th century, but the promise was not to be fulfilled. He made the mistake of dividing the empire between his three sons, but they quarreled over it and only one of them, Louis I, called the Pious, or le Débonnaire, the Easygoing, lived to survive him. It needed a genius like the founder to maintain the empire that he had created, and genius is not hereditary. Louis after an inglorious and turbulent reign, divided the empire among his three sons. It was not long before internal and external peace were at an end. Louis' sons turned their arms first against their father and then against one another. Finally the famous Treaty of Verdun was made (843) by which France, Germany and Italy became separate and independent states. This represents the beginning of France and Germany as we know them at the present time.

Other troubles were brewing even during Charlemagne's lifetime. The Norsemen came down on the Channel coast in 808 and returned at intervals in ever-increasing numbers, until in 841 they plundered Rouen and advanced toward Paris. They secured a foothold on the mainland, which, for the sake of peace, was recognized, and the Normans became an important factor in the politics of both France and England. They represent the disturbing element of the time. During this century, their hardy brethren secured a foothold in Sicily and southern Italy and set up a kingdom of their own in Russia under Ruric, who is looked back

to as the founder of the Russian dominions. Everywhere they went, the Northmen, instead of maintaining their own nationality, fused with but became the dominant element of the people whom they invaded. After a time they were the most French of the French, the most English of the English, and those who went to Ireland are often said to have become more Irish than the Irish themselves.

The frontiers of all the more civilized states suffered severely from the incursions of these barbarians and the 9th century represents another such a migration of nations as constituted such an important element in the history of Europe in the 5th century, when German tribes were pouring down upon the Western Empire and brought about its fall. The rulers were not such as to be able to maintain themselves in the face of these attacks. The very titles given the kings and emperors of the time indicate how low they had fallen in popular estimation. Louis I, le Débonnaire or the Easy-going, had among his successors men who received such titles as Charles I, the Bald; Louis, surnamed the German, somewhat at least in derision; Louis II, the Stammerer; Charles the Fat, and Charles III, the Simple, at the end of the century. The Eastern Empire was scarcely better off, for there was Michael II, called Balbus or the Stammerer, and Michael III the Drunkard, though at the end of the century came Leo VI, called the Philosopher, if that may be considered a title of respect for a king at a time when what is needed is not reflection but resolution and action. In the East the Caliphate declined, relieving the pressure somewhat on the Eastern Empire, but the northern nations now began their incursions and there was war with the Lombards, the Bulgarians, the Saracens and, a little later, the Russians.

The Norsemen were making all the coasts of the North Sea and for some distance inland unsafe and after a time wandered into the Mediterranean Sea to carry on the same devastation. The Saracens were, however, making life utterly miserable for the Mediterranean coast cities. All the islands, Malta, Sicily, Corsica, Sardinia, were attacked over and over again by them, and the Italian peninsula was often invaded. They captured Brindisi, Bari and Tarentum, burned Ostia and Civita Vecchia, invaded even some of the suburbs of Rome, destroyed the rich Abbey of Monte Cassino and threatened Naples, Salerno and Amalfi, so that some of these cities had to treat with them to be spared. They landed in southern France toward the end of the century, pillaged Arles and Marseilles (889) and founded a military colony in Provence from which to make incursions to various parts of the country. Between the Northmen and the other Teutonic barbarians from the North and the Saracens from the South, it is easy to understand what little peace or chance for the cultivation of the arts of life there was.

With weak rulers everywhere and invading barbarians, north and south, east and west, special provision had to be made for some sort of protection for the people. Charles Martel in the 8th century had organized a body of cavalry, rapidly moving troops, which could be sent from one part of the country to another to repel such invasions. They were available,

besides, to quell internal dissensions and came to be an important part of the government resources for peace. This was the origin of chivalry (cheval, horse), and it is easy to understand what a great development such a means of protection would take during the disturbed times after Charlemagne's death. These men on horseback came to be the resource of the weak from invading foreigners and rascally fellow countrymen. When justice failed, the knights errant often redressed grievances, and above all, protected the weak against the strong, and the innocent from imposition. Such an institution was open to the most serious abuses. Many a knight errant became an arrant knave, though most of them took their duties quite seriously and tried to right the wrongs they knew. A high sanction was given to knighthood by the institution of a solemn initiation after a novitiate as a squire. The knights assumed their duties and station very much as the members of a religious order. After a day of fasting and a night of prayer, the knight was solemnly invested with the insignia of his order under the patronage of some chosen lady. The high reverence for womanhood which it inculcated did much to lift knighthood to the highest plane. On the whole, our word chivalrous still enshrines a great historical truth with regard to this institution.

In the midst of the disturbances, due to barbarous incursions while kings and emperors were too weak to protect their subjects or to repel invaders, another institution, feudalism, arose, that was to have a deeper influence on history even than chivalry. The word *feudum* or *feodum* occurs first toward the end of the 9th century, but the institution had been gradually coming into existence for several generations. It means property held in consideration of service, the word probably being derived from the same root as the German *vieh*, cattle, with a secondary sense, property. Men were willing to hold their property on condition of service because this secured them protection from the owner in time of invasion or distraint. Like chivalry, this was subject to many abuses and degenerated in certain places to what was little better than slavery. Maine ('Early Law and Custom') said, however, "The feudal tenure which was certainly at first the tenure of servants, who but for the dignity of their master might have been called slaves, became in the Middle Ages the tenure of noblemen." Under this system everything belonged to the king or the lord, and all others held from him or from those who were holders from him, with specified obligations in return. The weaker man, in certain phases of feudalism, placed himself under the personal protection of a superior without altering his title or divesting himself of his estate. He became a vassal and did homage. The placing of his hands between those of his lord was the typical act by which their co-relation was established. The oath of fealty was taken at the same time. Feudalism was an institution needed for mutual protection in the disturbed times, which degenerated into a serious imposition and an infringement of rights in more peaceful times, and then had to be abolished. It still survives as a basis of the law relating to land both in England and Scotland.

The particular bright spot in the history of

the century is the life of King Alfred of England (849-901), who so well deserves the name of Great, the only English monarch ever given the epithet. The Danes had gained a foothold in England in the second quarter of the century, shortly after the seven kingdoms of the Saxon Heptarchy were united by the King of Wessex under the name Anglia (England), some 10 years after he had defeated the Britons decisively (813). The securing of rich booty was so easy in Britain that the Danes returned some 10 years later and under the weak Ethelwulf ravaged the country unmolested and burned the city of London (838). Ethelwulf made a pilgrimage to Rome, and some years after his return defeated the Danes on the Isle of Thanet. He was succeeded by his sons, Ethelbald and Ethelbert, who reigned jointly, and under whose reign the Church gained a great deal of influence. Under Ethelred, the Danes, no longer satisfied with incursions into the country, settled down in Northumberland and proceeded to add to their territory until defeated by Alfred, who ascended the throne (871). Alfred was only half-heartedly supported by his subjects, however, who had grown tired of the never-ending conflict, and only his indomitable character, rendered still braver by adversity, saved England from the northern invaders. Alfred was, however, much more than a warrior. He was a great constructive administrator and lawgiver, deeply interested in education both for himself and his subjects, a writer of no small capacity, one of those geniuses who are raised up to lift a period and a people from obscurity. Nothing so well illustrates how utterly independent of its environment the human spirit is in its capacity to do things than the careers of such men. Alfred's life has of course been a favorite subject of study to Englishmen ever since but it amply deserves all the attention that has been given to it.

Around Alfred's name have gathered a number of legends but with a core of historical truth which shows him at all times in life a really great man. Though the subject of internal disease, Alfred was most active in work. By measured candles he divided his day into three parts of eight hours—one for sleep, one for work, and one for recreation of the body and diversion of mind. His evenings were given to study or dictation or intellectual intercourse with friends. He was no mere bookman but an active administrator. He repaired the fortifications destroyed by the Danes, cleared the land of robbers and increased the fleet, laying the foundation of England's naval greatness. Justice was his hobby and he severely punished unjust judges. He compiled a code of laws from preceding customs, modestly refusing to add much of his own. His chief interest in the midst of all this activity was letters and he felt that the royal example would do more than anything else for the encouragement of literature, so he made translations of the Latin authors into English, and he was the founder of our literature. He translated Pope Gregory's work on 'Pastoral Care' and sent a copy to every diocese as a sort of standard of the English of the time. He made translations of Orosius and Bede. His favorite work was Boethius' 'Consolations of Philosophy,' the free

translation of which by him gives the best insight into Alfred's own character and his outlook on life. It is just over a thousand years since the death of this "darling of the English," of whom historians agree that he was "the wisest and the best and greatest king that ever reigned in England." Alfred was very much interested in travel and through him we have the account of the Norsemen who sailed around the North Cape to explore the coast of the White Sea and from end to end of the Baltic. These undaunted spirits reached the Faroë Islands (861) and Iceland (870). Iceland, in the course of the next three centuries, separated from the warring elements on the Continent, developed so that in the 11th and 12th centuries the island gave birth to a great literature which has attracted wide attention in modern times. Iceland was the first step to Vineland (America).

Alfred found it impossible to drive the Danes from England, so after establishing his own kingdom, he recognized their settlement of the northeastern part of England in the treaty of Widdemer (872). Here they continued to receive accessions from their home country, and this part of England came to be known as the Danelaw or Danelagh, and as it occupied practically all of the east coast of England and stretched well beyond the middle of the country, only a comparatively small territory was left for Alfred, and yet it is his rule over this that has given him immortal fame. His intellectual and spiritual influence and not the number of people that he ruled revealed his greatness. The Danes continued to grow in number and power all during the next century, until finally the Danish king, Canute, came to rule over all England as well as the Norse countries, and was really the head of an empire.

The 9th century saw the extirpation of the Picts or early inhabitants of Scotland, by Kenneth, king of the Scots, bringing another people with a destiny into history. The greatest Pictish monarch of history, by name MacFergus, after a contest with a series of rivals, gained the supremacy which he held in the second half of the 8th century. It is not known just how, at the middle of the 9th century, Kenneth MacAlpin, called by all Scottish records a Scot, succeeded in reversing this conquest of the Picts and putting a Scottish man on the throne of Scone, but this was the beginning of modern Scotland.

There are traditions of the foundation of Oxford and Cambridge as universities at the end of the 9th or the beginning of the 10th century, but they are not substantiated. Schools were founded at both of these places, perhaps in Alfred's time, and they continued to be centres of the intellectual life for England, but neither of them deserves the name of university even in the loosest sense that can be given to that term, until the 13th century. Alfred's interest in literature and the intellectual development of his people did much for education, but the seeds thus planted needed long cultivation before flowering into higher institutions of learning. Some would trace the tradition of a foundation at Oxford back to Brutus in Roman times, but the rejection of such legends as of those of Alfred's foundering of Oxford should not prevent students from recognizing how

much the great king actually accomplished, even though it were not all that the myths which have gathered around his name would assert.

A great scholar of the century, whose work has been revived to have far reaching influence in our time was John Scotus Erigena or Eriugena (Erin born). Wales and Scotland both claimed to be his birthplace, but it is now generally admitted that he was born in Ireland. His knowledge is interesting as an index of the scholarship of the time. His work shows that he knew Latin well and also Greek, in which he even wrote some poetry, that he knew some Hebrew at least, though it is doubtful that he had any knowledge of other Oriental languages sometimes attributed to him. His principal work is the *'De Divisione Naturæ'* in which in dialogue form, he treats the principal problems of philosophy and theology. "He declares that the creation of the world is in reality a theophania or revelation of the essence of God in the things created. Creation is a process of the unfolding of the divine nature. His system is a combination of neo-Platonic mysticism, emanationism and pantheism which Erigena strove in vain to reconcile with Aristotelean empiricism, Christian creationism and theism." (Turner, *'History of Philosophy'*). His pantheism was condemned at the Council of Paris in the 13th century after having been the subject of a number of ecclesiastical censures before. His works lived on, however, to influence the German mystics in the following centuries, and his ideas have a fascination for certain minds. A thousand years after his death, at the end of the 19th century, one of the most popular systems of philosophy among German university men of a certain type, that of Transcendental idealism, recurs to Erigena's mode of thought and forms of expression, and the confirmed adherents of this school recognize in Erigena a kindred spirit and speak of him in the highest terms. A thousand years is often supposed to be a sufficiently long interval for the progress of human thought to a position far advanced beyond previous modes of thinking, yet here is one of these phases of recurrence of interest which is so often to be met with.

In connection with Erigena we hear of Gottschalk, a German monk, whom Erigena answered, but in doing so fell into errors himself, and Rabanus (Hrabanus) Maurus, who after some years with Alcuin at Tours, became a teacher at Fulda and then headmaster of the school there. He made Fulda the best-known school in Europe. He wrote a pedagogical work, *'De Universo'*, a sort of encyclopædia in 22 books. His works show how broad were the interests of his time. He became Abbot of Fulda and proved a magnificent practical administrator, adding to the buildings and equipment. He took a determined stand in supporting Louis the Pious against his rebellious sons, and afterward supported Lothair the eldest, in the hope of having a single strong government. After the defeat of Lothair he resigned his abbacy, but later was reconciled with Louis the German and then was made archbishop of Mainz, doing much in that position to make that city the enduring seat of ecclesiastical authority it was for so many centuries. Rabanus is a typical example of a great scholar who was a fine force for good of many kinds in his time.

The first mention of the episcopal school at Paris later to become the brilliant university was 882. Rulers and the Church did all in their power to maintain the schools founded by Charlemagne and to extend them, but the constant necessity of being ready to fight the barbarians, north and south, and the destruction of schools and of religious houses by them utterly precluded any idea of educational progress and very soon brought decline. The surprise is that anything was accomplished under the disturbing conditions. Libraries were founded, however, and that of Saint Requier (831) is known to have contained a number of volumes of the Latin classics, at least one of which, *'Trogus Pompeius'*, is lost to us.

The Venetians come prominently into history in this century. The people of the neighborhood of Aquileia who in the 5th century took refuge from the Huns under Attila in the lagoons of the northern Adriatic came very naturally to be a seafaring people, and as the medium of exchange between the East and Italy, achieved prosperity. How great this was in the 9th century, and how high the standard of æsthetic taste had come to be among this merchant people, is very well illustrated by the fact that the great cathedral of Saint Mark's was built in the second half of this century. Its style was that of Roman architecture, modified by contact with the East and known commonly as Byzantine. Without such a monument it would be almost impossible to believe that in the midst of these bitter, troubled times, when Venetian trade by sea must have been seriously disturbed by Saracenic and Norse pirates, there were men thinking in terms of fine art for a people whose own tastes were so well developed that they were thoroughly capable of appreciating such work and helping liberally in the construction of it.

While Charlemagne at the beginning of the century was doing so much for education and the beginning of culture in the West, his great Eastern contemporary, Haroun Al Raschid, was encouraging intellectual development in the Caliphate in such a way that he has been deservedly famous for it ever since. His successor, Al Mamun, the seventh Abasside Caliph of Bagdad (813-933), the youngest son of Haroun, followed his father's example so well that he bears the title of "the father of letters and the Augustus of Bagdad," while his reign is spoken of as the Augustan Age of Mohammedanism. As governor of Khorassan before the death of his father he founded the college there and attracted a number of distinguished teachers. After he had unseated his elder brother and quelled some insurrections and especially a religious war that at one time threatened to uncrown him, he made his capital, Bagdad, a centre of intellectual activity. He was himself an ardent student of mathematics and astronomy and the first Arabic translation of Euclid is dedicated to him. He founded observatories at Bagdad and near Damascus, caused a degree of the meridian to be measured on the plane of Shimar and had astronomical tables constructed, which are said to be wonderfully accurate. He was an author of no little merit, some of whose books are well known to Mohammedan scholars. With him ended the period of Arabian encouragement of letters so far as the Caliphs were concerned. There

seems no doubt now that the influence exerted by himself and his father in letters and education have been exaggerated by the very surprise of finding anything of this kind under the Caliphs. From this time forth Eastern Mohammedanism represents a dreary lack of interest in things intellectual, except for a period in Persia in the 11th century, when native genius triumphed over an unfavorable environment and wrote a series of works that have lived. Moorish culture in Spain came as a later growth.

JAMES J. WALSH,
Author of 'The Thirteenth, the Greatest of Centuries,' etc.

PRINCIPAL EVENTS OF THE NINTH CENTURY

800. Charlemagne crowned Emperor of Western Europe. The golden period of the Arabian or Saracenic Empire under Haroun-al-Raschid, Caliph of Bagdad. The Arab University and library of Cordova, famed for science throughout Europe. The Turks or Tartars of the Altai Mountains advance westward.
808. Normans invade northern France.
813. Al-Mamun, youngest son of Haroun-al-Raschid, succeeds as Caliph of Bagdad.
814. Death of Charlemagne.
827. Egbert overlord in England unites the seven Anglo-Saxon kingdoms.
832. Normans and Danes infest England.
833. Death of Al-Mamun, Caliph of Bagdad.
838. Danes invade England and burn London.
840. Employed as mercenaries by the Arabs, a bodyguard of Turks dispose of the throne and limit the Caliph to Bagdad.
843. Division of Charlemagne's Empire. Treaty of Verdun. The independent beginnings of the kingdoms of France, Germany and northern Italy.
845. Northmen threaten Paris.
849. Alfred the Great of England born.
850. Venice rises in power; the cathedral of St. Mark's built.
862. Rurik becomes first king of Russia.
868. Achmet the Turk seizes Egypt and Syria.
870. Northmen discover Iceland and later settle there.
871. Alfred becomes king of Wessex, England.
878. Alfred of England defeats the Danish invasion; forms a navy; enacts wise laws; cultivates learning and science, and founds schools at Oxford and Cambridge.
882. The episcopal school at Paris spreads education.
886. Northmen besiege Paris.
889. Saracens attack and sack Arles and Marseilles.
897. Basilus I, Macedonian legislator and economist, defeats Arabs and Bulgarians.
899. Louis IV last emperor of Charlemagne's line.

NINUS, nī'nūs, eponymous king of Nineveh and founder of that city. His name is nowhere mentioned, apparently, in Assyrian monuments, and the story that he extended the Assyrian Empire to India and to Egypt is historically false. But he figures largely in Greek myth and "history," where Nineveh is said to have been founded by him and named for him; he married Semiramis, wife of Onnes, but his wife murdered him, and ruled as regent for her son Ninyas, who is as mythical a personage as his father. For Semiramis alone in these stories does history show any actual existence.

NIOBE, nī'ō-bē, in Greek mythology, the daughter of Tantalus, was the wife of Amphion, who, in common with Zethus, governed Thebes, which they had built. According to the common accounts she had seven sons and seven daughters, and, proud of her blooming offspring, so far forgot herself as to exalt herself above Latona, the mother of only two children—Apollo and Artemis; and in punishment for her presumption she had to witness the destruction of her children by the arrows of the twin deities. Anguish and despair petrified the wretched mother, after long wanderings, into a stone. Amphion and Zethus also fell, pierced by the arrows of Apollo, when, full

of wrath, they penetrated into the sanctuary of the god. This is the most common account of the fate of Niobe, in the circumstantial details of which poets frequently differ, who have taken this story for a subject as often as artists. The origin of the fable seems to lie in the ancient figure of speech by which it was said of young people who died suddenly that they had been struck with the arrows of Apollo or Artemis; and in almost all languages, petrification is the natural image of the highest degree of torpid despair.

NIOBE OF NATIONS, The, a name applied to Rome, the "lone mother of dead empires."

NIOBIUM, in chemistry, a metallic element discovered in 1801 by Hatchett and called by him columbium, but more fully investigated by Rose, who gave it its present name. Niobium is present in tantalite, euxenite, pyrochlore and in other minerals. The metal may be prepared from the fluoride of niobium by heating it in a covered crucible with sodium and dissolving out the soluble salts with water. It is insoluble in nitric acid, soluble with difficulty in hydrochloric acid, but dissolves in hot hydrofluoric acid. It forms two oxides of a chlorus character, uniting with basylous oxides to form salts.

NIOBRARA, nī-ō-brā'ra, a river which has its rise in Laramie County, Wyo., and which flows east into Nebraska, crosses the northern part of the State, making regular, long north and south curves, and flows into the Missouri River at Niobrara in Knox County. It is about 450 miles long, flows rapidly in the upper part of its course, but moves slowly through the almost level prairie country of the northern part of Nebraska.

NIOBRARA STAGE, in geology, a subdivision of the upper Cretaceous division, forming with the Benton stage the Colorado Epoch. It has a thickness of from 400 to 1,000 feet and includes chalk, calcareous marls, shales, sandstones and limestones, which in most of the area are in two formations—Timpas limestone below and Apishapa shale above. These formations are especially conspicuous in Kansas, eastern Colorado, South Dakota, Wyoming and northern New Mexico. Large numbers of fossil bones and shells occur in the group, notably huge reptiles and fish and birds with teeth. Elasmosaurus, a reptile from the Niobrara chalk beds in Kansas, was over 40 feet long, half of its length being a slender neck. The Tylosaurus, a great marine lizard, is also found.

NIORT, nyôr, France, the capital of the department of Deux-Sèvres, 42 miles east of La Rochelle, 40 miles southwest of Poitiers and 254 miles southwest of Paris by rail. Niort lies on the left bank of the Sèvre Niortoise, partly in the valley and partly on the surrounding hills. Until the 7th century the Niort plain formed part of the Gulf of Poitou and the mouth of the Sèvre was at the foot of the hills where the town subsequently developed around the castle erected in 1155 by Henry Plantagenet. It was captured by Louis VIII in 1224. By the Peace of Bretigny (1360) it was ceded to the English; but the inhabitants revolted against the English and the Black Prince took the town, by assault and massacred many of the

inhabitants. In 1373 the French, under Du Gesclin, regained possession of their city. Niort became a centre of Protestantism and Gaspard de Coligny, having made himself master of the town, resisted the Catholic forces after the battle of Jarnac (1569) but surrendered after the battle of Moncontour (1569). Henri IV took Niort and the town suffered severely by the Revocation of the Edict of Nantes (1685). The town consequently is full of historical associations, not the least of which is that it was the birthplace of Madame de Maintenon. Of the ancient castle there remains only the donjon—two large square towers joined by a central building flanked by turrets—said to have been built by Henry II or Richard Cœur de Lion. From the turrets a superb view is obtained of the valley of the Sèvre and the beautiful public garden (which ranks as one of the finest in France). The church of Notre Dame, dating from the 15th and 16th centuries, is a splendid example of late Gothic and Renaissance architecture. Its spire rises to a height of 246 feet and is beautifully adorned with statues of the evangelists. Saint André, noted for a fine window in the apse, and Saint Hilaire, noted for its fine frescoes, were built in the 19th century. The town hall, named Aliénor Palace, after Eleanor of Guienne, is Renaissance in style. It houses a fine collection of antiquities. In the vicinity of Niort are the ruins of the feudal fortress of Coudray-Salbart. Niort is the seat of a prefect and a court of assizes. It has a board of trade-arbitration, lycées for girls and boys, a chamber of commerce and a school for drawing. It also has a branch of the Bank of France. The public garden and the nurseries are celebrated. The town has a large trade in gloves, dressed chamois, oil, brushes and leather. Pop. 23,775.

NIOX, ny-ôks', **Gustave Léon**, French soldier: b. Provins, Seine-et-Marne, in 1840. He was the son of an army officer, was educated at the Prytanée Militaire de la Flèche and served in the Mexican campaign of 1862-65. In 1870-71 he was in high command during the siege of Paris. After this period he taught in the École Supérieure de Guerre and became commandant of the Invalides and director of the army museum. His 'Simple secit de la guerre de 1870-71' (1897) was crowned by the Academy. He also published 'Recit historique de l'expédition du Mexique' (1874) and edited 'Collection d'ouvrages de géographie militaire' (6 vols., 1876) and 'Atlas de géographie générale' (1887).

NIPA, an East Indian palm (*Nipa fruticans*) of the order *Palmae* and the only species of its genus and frequent at the mouths of rivers from the Philippines to Ceylon and Australia. It is a low-growing tree with creeping, smooth stems and large clusters of fruit. Its abundant sap is used for sugar and wine making and its feathery leaves for thatching or roofing. These leaves are often 20 feet long and form the principal material for house-building in the farms and villages of the Philippines and East Indies generally. It abounds in the salt marshes and, like the mangrove (q.v.) with which it is commonly associated, it is an important land-builder.

NIPAL, nē-pâl'. See **NEPAL**.

NIPHER, Francis Eugene, physicist: b. Port Byron, N. Y., 10 Dec. 1847. He was graduated from the Iowa State University in 1870 and became instructor there. In 1874 he went to Washington University as professor of physics. In 1877 he organized the Missouri Weather Service which he conducted at private expense for 10 years. During the summer months from 1878 to 1882 he made a magnetic survey of Missouri. The results of an active life of study, experiment and achievement in various scientific lines are embodied in his works: 'Theory of Magnetic Measurements' (1886); 'Electricity and Magnetism,' a mathematical treatise (1895); 'Introduction to Graphical Algebra' (1898); 'Experimental Studies in Electricity and Magnetism' (1914). He has contributed many scientific papers to the *Transactions* of the Academy of Science of Saint Louis, of which he is a member. He is a fellow of the A. A. A. S., member of the American Physical Society, the Physical Society of France and of the Royal Society of Arts, London.

NIPHON, nîf-ôn'. See **NIPPON**, or **NIHON**.

NIPIGON, a lake in Canada. See **NEPIGON**.

NIPISSING, nîp'i-sîng, or **LAKE NEP-ISSING**, in Ontario, Canada, lies at an altitude of 644 feet above sea-level, northeast of Georgian Bay, Lake Huron, with which it communicates by French River. It is irregular in coast-line, is 48 miles long, has a maximum breadth of about 30 miles and an area of 330 square miles. Its chief feeder is Sturgeon River, draining from the north a group of smaller lakes. The lake contains numerous islands, one of which is an Indian reservation. The Canadian Pacific, Grand Trunk, Canadian Northern and Timiskaming and Northern Ontario railways touch its shores. Steamers ply on the lake and the region has become a favorite sporting and hunting ground. The watershed separating it from the Mattawa River and the Ottawa Valley marks the summit level of the proposed Georgian Bay Canal. The route from Montreal via the Ottawa River and Nipissing to Georgian Bay was that taken by the old *voyageurs*.

NIPISSING INDIANS, an American tribe of the Algonquin family residing, when discovered by the French in 1613, on the shores of Lake Nipissing, in northern Ontario, Canada. In the 17th century they were one of the most important tribes of British America and were regarded by the Jesuit missionaries as the typical Algonquins. After their dispersion by the Iroquois they fled to Nipigon and some settled at Three Rivers. They were semi-nomadic and comparatively unwarlike, and staunch friends of the French. Their chiefs were elective. The Indians on the reserve at Lake Nipissing are classed as Chippewas.

NIPMUC INDIANS, or "fresh water people," an American tribe residing chiefly in colonial days in central Massachusetts. The majority of the Nipmucs did not at first join with Philip in his war against the colonists, but were active against the English during the struggle in Connecticut in 1675. In January 1676 the remnant of Philip's tribe, with the Narragansetts, the Quaboag and River Indians, effected a junction with the Nipmucs. On the overthrow of Philip some of the Nipmucs fled to

Canada and others dispersed westward on the Hudson River.

NIPPER, Susan, in Dickens' 'Dombey and Son,' a young maid, nurse to Florence Dombey. She marries Toots. The sharpness of tongue whereby she justifies her name is offset by fidelity to her charge.

NIPPERDEY, nĭp'pĕr-dĭ, **Karl Ludwig**, German philologist; b. Schermin, Germany, 13 Sept. 1821; d. Jena, Germany, 2 Jan. 1875. He was educated at the universities of Berlin and Leipzig and in 1852 accepted a professorship at Jena. He made translations of Cæsar, Nepos, Tacitus, etc., with critical notes, which have been widely used. See Schöll's biography (1875), and his collection of his works, 'C. Nipperdeii Opuscula' (1877).

NIPPON, or NIHON, the Japanese pronunciation of the name Jih-pĕn, which is the Chinese pronunciation of the characters meaning "sun-origin," that is to say "the place the sun comes from." This name was given to Jih-pĕn (or Japan) by the Chinese on account of the position of the islands to the east of China. Marco Polo's Zipangu and the poetic Cipango are from the same Chinese compound with the addition of the word *go* (or *kico*), which means country. The name Nihon (Japan) seems to have been first officially used by the Japanese government in A.D. 670. Before that time the usual designation of the country was Yamato, properly the name of one of the central provinces. Another designation is O-mi-kuni, "the Great August Country." Yamato and O-mi-kuni are the names the Japanese prefer in poetry and belles-lettres. Japan has other ancient names, some of which are curiously long, for example: Toyo-ashi-wara-no-chi-aki-no-naga-i-ho-aki-no-mizu-ho-no-kuni, which means "the Luxuriant-Reed-Plains-the Land-of-Fresh-Rice-Ears-of-a-Thousand-Autumns-of-Long-Five-Hundred-Autumns." Consult *Asiatic Transactions* ('Kojiki'), Vol. X, Supplement.

NIPPUR, nĭp-poor', Mesopotamia, an ancient city of Babylonia, between the Tigris and Euphrates, 120 miles southeast of Bagdad, its site now marked by the numerous mounds and excavated ruins at Nuffar. It was built on both sides of the Shatt-el-Nil Canal, one of the early sources of the Euphrates. Nippur was a great and flourishing city 4000 B.C., and the tablets of its great library discovered since 1888 antedate Abraham's departure from Ur of the Chaldees for the Promised Land. Nippur is identified with the Calneh of Genesis x, 10, and was the most northerly and easterly of the four conspicuous centres of Babylonian civilization and religion, literature and science. It was the seat of the worship of En-Lil, the father of the gods and Lord of the Storm, the cause of all the weather troubles of mankind and the original conception of a god of anger and a religion of fear. Marduk, the supreme god of Babylon, superseded him about 2300 B.C., and there were 24 subordinate deities.

Nippur was overthrown and its buildings ruined by the Elamite hordes under Kudur-Nankhundi, 2285 B.C., who destroyed nearly every city of Babylonia. Favored by the permission and protection of the sultan and his administration, the University of Pennsylvania

has since 1888 excavated and laid bare many of its important ruins. The western half represents the remains of the city proper, the eastern half the great temple sites. The work was supervised first by Dr. John Punnett Peters and latterly by Dr. J. H. Haynes and Prof. H. V. Hilprecht. Considerable attention was paid to the excavation of the great temple of En-Lil, the foundation of which was laid between 6000 and 7000 years before Christ. Nine strata can be distinguished in the temple courts, dating from 3800 to 350 B.C. An ancient government palace of immense proportions, where the kings lived, belonging to the fifth millennium before Christ, and one of the ancient gates and walls of the city, were uncovered. A government palace erected about 3000 B.C. was completely and systematically excavated, besides numerous other buildings of less importance. Most valuable inscriptions in stone belonging to the earliest rulers of Babylonia, by the help of which the early history of mankind in the valley between the Tigris and Euphrates, will be reconstructed, were discovered. Antiquities in coins, jewelry in gold, silver and bronze in great quantities; vases in enameled and plain pottery of all periods; seals and seal cylinders, such as the Babylonians used in connection with their business transactions; images of gods, playthings in terra-cotta, bas-reliefs, weights, utensils in bronze, iron and silver, etc., were also found. These were a few of the important relics recovered, without mentioning the numerous facts ascertained and the many questions solved through study in the trenches, which have important bearing upon the religious ideas and customs of the daily life of the Babylonians. But chief of the important discoveries made during 1889-1900 were those in connection with the famous library of the sanctuary, which was found beneath 25 feet of accumulated débris, representing several millenniums of history. In the uppermost stratum of this mound the excavators found coffins which had been buried in the early centuries of our Christian era. A great many antiquities were also gathered which belonged to the Jews who continued to live at Nippur after the return of Ezra and Nehemiah. Prominent among them were terra-cotta bowls containing incantations and charms inscribed in Hebrew and Mandæan. At a depth of 25 feet were found a series of rooms, a number of which contained ledges or shelves built out from the wall, for the purpose of laying out the tablets in rows. The library seems to have been divided into two parts. There was a business section for keeping accounts, and the educational quarters, with a vast library of a literary character.

Nearly 20,000 tablets were recovered, illustrating practically every branch of literature known to the Babylonians. Among the inscriptions are hundreds of historical texts, dictionaries or lists of Sumerian words with Semitic equivalents; lists of birds, animals, plants and stones; lists of words for chairs, stools and other articles of furniture; hymns, astronomical and mythological inscriptions, tablets which refer to the service and functionaries of the temple—how many garments the god En-Lil wore, how many temples and shrines there were at Nippur besides those dedicated to En-Lil, and what the revenues of the temples were; tablets containing

grammatical sentences written by students, arithmetical calculations, etc.

In appreciation of Professor Hilprecht's valuable services, the sultan presented him with, among other important antiquities, the largest part of the find of the library, which is now deposited in the University of Pennsylvania.

Only a small portion of the mounds at Nippur has thus far been completely excavated. Considerable work yet remains to be done on the temple. Only one side of the ancient government palace has been cleared, and about one-twentieth part of the library, but arrangements have been effected for a continuance of the work of excavation until completed. (See ASSYRIA; BABYLONIA). Consult Fisher, C. S., 'Excavations at Nippur' (New York 1905-06); Geere, 'By Nile and Euphrates' (ib. 1904); Hilprecht, 'Old Babylonian Inscriptions, Chiefly from Nippur' (ib. 1893-96), and 'Explorations in Bible Lands During the Nineteenth Century' (ib. 1903); Peters, 'Nippur, or Explorations and Adventures on the Euphrates' (ib. 1897); Zehnfund, 'Babylonien in Seinen wichtigsten Ruinenstätten' (Leipzig 1910).

NIRGUA, nēr'gwa, Venezuela, city in the state of Yaracuy, 110 miles southwest of Caracas. Nirgua was founded in 1554 and in 1565 rich gold mines were discovered in the neighborhood. Copper, coal and other minerals exist here and sulphur is also abundant. Hence the region is peculiarly rich. The neighboring country also produces coffee, cacao, sugar, tobacco and cotton as well as livestock. Pop. about 10,000.

NIRUKTA, nī-rook'ta. See VEDA.

NIRVANA, nīr-vā'na, a term which originally denotes the blowing out or extinction of a flame, and is used in the metaphorical language of Buddhist philosophy to mean that condition which succeeds to the long process of metempsychosis to which imperfect souls are subjected before they reach the end of Karma, the active life of earthly effort and struggle after perfection. Nirvana, according to Rhys Davids, was originally intended by Buddha to indicate extinction of existence, annihilation, as an escape from the perturbations of passion and the miseries of life. The utterly negative character of this conception seems later on to have undergone a change. Buddha has said, "It is enough to know that Nirvana is an advance beyond life; it is a condition of fearless security and happiness." But there is no definite implication that this happiness is conscious, or that a sense of personal identity accompanies it. Annihilation may be quite consistent with "Freedom from the pang of earthly existence," and even prove "a region or condition of peace." This peace in Nirvana results from the fact that no transmigration into baser forms of wretched ghost, beast or demon is possible for the enfranchised spirit. The "extinction" in this case will only mean the extinction of the baser elements in the individual. The great and pure elements are developed in inverse ratio; there follows a calm and sinless state of mind, such as even Lucretius sometimes caught sight of when he speaks of "vita dis digna" as the object of the philosopher. "The life worthy of Gods"—holiness, purity, freedom, wisdom—this is nirvana in the true Buddhist sense;

though when and where it is to be realized is left one of the misty problems of oriental mysticism. Consult Dahlmann, 'Nirvana' (Berlin 1897); Rhys Davids, 'Origin and Growth of Religion as Illustrated by Indian Buddhism' (London 1881), and 'Buddhism' (ib. 1896); Max Müller, 'The Meaning of Buddhism' (ib. 1857); Oldenberg, 'Buddha, sein Leben, seine Lehre, und seine Gemeinde' (Eng. trans., 1882); Poussin, 'Bouddhisme' (1909). See BUDDHA; BRAHMAN; HINDUISM; JAINS.

NISAMI, nī-sā-mē. See NIZAMI.

NISAN, nī'sān, in the Jewish calendar, the first month of the sacred year and seventh of the civil year, answering nearly to our March. See CALENDAR.

NISARD, Jean Marie Napoléon Désiré, zhōn mā-rē nā-pō-lā-ōn dā-zē-rā nē-zār, French author: b. Châtillon-sur-Seine, 20 March 1806; d. San Remo, Italy, 27 March 1888. He became professor of eloquence at the Collège de France, Paris, in 1843; in 1852 inspector-general of education; in 1857 director of the École Normale Supérieure, and in 1867 a senator. In 1850 he was elected to the Academy. He belonged to the doctrinaire school of criticism, which he tried to exalt into an exact science. His reputation as a historian of literature was established by his 'Les poètes latins de la décadence' (1834). Others of his works are: An excellent 'Histoire de la littérature française' (1844-61); 'Mélanges d'histoire et de littérature' (1859); the distinguished study, 'Les quatre grands historiens latins' (1875), and 'Nouveaux mélanges' (1886). Consult his 'Souvenirs et notes biographiques' (1888).

NISBET, nīz'bēt, Hume, Scottish artist and novelist: b. Stirling, Scotland, 8 Aug. 1849. Leaving Scotland at 16, he spent six years in Australian travel and on his return was for eight years prior to 1885 art master in Watt College, Edinburgh. He has since twice revisited Australia and has published 46 romances, including 'Bail Up'; several volumes of verse, and various works on art, such as 'Where Art Begins,' and also of travel, such as 'A Colonial Tramp.'

NISBET, John, Scottish forester: b. Edinburgh, 2 Oct. 1853; d. 1 Dec. 1914. He was educated at Edinburgh University and also studied in Munich. Entering the Indian forest service in 1875, he became conservator of forests, Burma, in 1895, retiring in 1900 and receiving the Kaiser-i-Hind gold medal for his services. In 1912 he was appointed adviser to the Scottish Board of Agriculture. He has published 'British Forest Trees' (1893); 'Studies in Forestry' (1894); 'Our Forests and Woodlands' (2d ed., 1908); 'The Management of Forests in Theory and Practice' (1901); 'Burma under British Rule and Before' (1901); 'The Elements of British Forestry' (1911).

NISBET, Robert Buchan, Scottish painter: b. Edinburgh, 1 July 1857. He was educated at the Edinburgh Institution and chose as his profession that of landscape painter in water colors. His success was attested by the awards made to him at three international exhibitions—Dresden (diploma) 1892; Antwerp (medal) 1894; Vienna (medal) 1898. He was elected an associate of the Royal Scottish Academy in 1893 and a full member in 1902. Among his

most notable works are 'Evening Stillness' (purchased by the Chantrey Bequest) 1890; 'Thundery Weather'; 'Harrowing'; 'Waiting for the Tide' (1898); 'Between Showers' (1898); 'November Evening' (1899); 'A Fishing Village' (1900). Many of his works are in public collections.

NISH, nēsh, or **NISSA**, nēs'sā, Serbia, a fortified city on the Nishava, a tributary of the Morava, 130 miles southeast of Belgrade. It has Turkish and Serbian sections, but holds a position of strategic importance on the Vienna-Constantinople and Salonika Railroad routes. It was the seat of the National Assembly until 1901, and is the see of a Greek bishop. It has hot springs and baths, celebrated since the Roman era, when Nish is mentioned as Naissus by Ptolemy. Constantine the Great was born at Nish. Situated at the junction of many of the main highways of the Balkan Peninsula, it has had a turbulent history, in 1456 being captured by the Turks; in 1878 it was taken by the Serbians under king Milan. The unsuccessful attack in 1809 is still perpetuated by the "Tyele-Koula" (Tower of Skulls), erected by the Turks half a mile east of Nish, and consisting of the heads of Serbians killed during the battle. Pop. 24,949, including 2,000 Moslems. It became the temporary location of the Serbian government after the outbreak of the Great War in July 1914, and on 6 Nov. 1915, during the successful campaign of the Central Powers against Serbia, fell to their forces after three days of heavy fighting.

NISHAN EL-AAMAN, nī-shān' ēl ā-mān' (Ar. *Nishan al-āman*, order of the best), Tunisian order of honor founded by Mohammed-es-Sadok in 1859. It commemorates the adoption of the constitution and has but one degree.

NISHAN EL-IFTIKHAR, ēl-if-ti-kār', a Tunisian order of merit.

NISHAN EL-IFTIKHAR, Turkish order founded by Sultan Selim III and revived in 1827. It is conferred upon foreigners who have rendered services to the Turkish state. There are no classes of honor, but the value of the medal differs with the degree of the recipient.

NISHAN I-IMTIAS, ēm-tē-ās', Turkish order of merit founded in 1879 by Sultan Abdul Hamid. It is conferred upon Turkish officials who have displayed at least three of the attributes: patriotism, fidelity, bravery and zeal, these names being engraved on the medal.

NISHAN I-SHEFKIAT, ē-shēf-kāt' (Ar-Pers. *Nishān-i-shifqat*, order of clemency), Turkish order of three degrees established by Sultan Abdul Hamid in 1878. The medal is conferred upon women who have rendered aid to their country in times of war or peril.

NISHAPUR, nīsh-ā-poor', Persia, the capital of a province of Khorasan, situated in the northeast of the country in a fertile plain at an altitude of 3,900 feet, 50 miles west of Meshed. Anciently it was of great commercial and political importance. An active domestic trade is still carried on, and the city has long been celebrated for the quality of the turquoises found in the district. Omar Khayyam was born here in 1123, and his unpretentious tomb is shown in a mosque among the ruins of the old town. Pop. about 15,000.

NISHGAR. See **NASS INDIANS**.

NISI PRIUS, (1) *in law*, authority for the judges to proceed on their circuits and try causes by jury. (2) Formerly, a writ ordering the sheriff to have the jurors in a civil case at Westminster on a day named unless the judge should previously go to the proper county in which to try the cause. (3) A general term for the trial of civil causes before a jury. It is applied to-day in England to actions before the King's Bench Division of the High Court of justice in London, and also popularly in the country districts to designate proceedings in certain civil courts in the circuits under the Judicature Acts. The term is used in the United States also, mostly to designate civil courts whose judges travel in circuits and which try cases with the aid of a jury.

NISIBIS, nīs'i-bīs, Asia Minor, anciently an important town, the capital of Mygdonia, Mesopotamia, now the town of Nisibin, in the district of Diarbekir. The cuneiform inscriptions found here refer to it as Nasibina. It held a commanding situation on the road between the Tigris and the Mediterranean, and was frequently taken and retaken in the wars between the Romans and the Parthians and afterward between the Romans and Persians, until it was given up to the latter by the Emperor Jovian in 363. The Persians were defeated here by Belisarius in 451 and by Marcian in 573. Pop. 4,000.

NISQUALLI (nīz'kwā-lē) **INDIANS**, an American tribe of the Salishan family formerly residing on Puget Sound, Washington. They joined the Puyallup and other tribes in signing the Medicine Creek Treaty of 1854. In 1858, the Nisquallis took part in the general Indian war in the Northwest. There are to-day rather over 100 survivors.

NISROCH, nīs'rōk, in Assyrian mythology, a god, in whose temple, and in the very act of idolatry, Sennacherib was slain by his own sons (2 Kings xix, 37). The name signifies "the great eagle"; and the earlier Assyrian sculptures exhumed at Nineveh have many representations of an idol in human form, with the head of an eagle. Among the ancient Arabs, also, the eagle occurs as an idol. Historians long accepted Joseph Halévy's conjecture that the word is a corruption of Nusku; while it has also been held to be identical with Marduk of the latter Babylonian pantheon, and by others again as a corruption of Asur.

NISSA, nēs'sā, Servia. See **NISH**.

NISSEN, Heinrich, hīn'rīh nīs'sēn, German archaeologist; b. Hadersleben, Germany, 3 April 1839; d. March 1912. He was educated in Kiel and Berlin, and in 1869-76 was professor of ancient history in Marburg and subsequently held professorships in Göttingen, Strasbourg and Bonn. He wrote 'Kirtische Untersuchungen über die Quellen der 4 und 5. Decade des Livius' (1863); 'Italische Landeskunde' (1883-1902); 'Grieschische und römische Metrologie' (1887); 'Studien zur Geschichte der Religion Ourlentation' (1906-11); etc.

NISUS, nī'sūs, Greek mythological king of Megara. His life depended upon a lock of gold or purple hair and of this his daughter Scylla deprived him when Minos, of whom she was enamored, laid siege to Megara. This act of

treachery enabled Minos to take the city, but shocked by the conduct of Scylla, he had her tied to the stern of his ship and by some accounts she was drowned in the Saronic Gulf. Another legend makes her swim after Minos' ship and she is then pounced upon by her father in the form of a sea-eagle, whereupon she changes into the sea-bird Ciris, and is ever after pursued by him. Consult Frazer, 'The Golden Bough' (1900).

NITHARD, nē-tär', Frankish historian: b. about 795 A.D.; near Angoulême, 15 May 843. He was a grandson of Charlemagne. He was in the service of Louis the Pious, and later of Charles the Bald, whose cause he espoused during the dissensions between the sons of Louis. He fought in the battle of Fontenay, and was killed in a battle against the Northmen. At the command of Charles the Bald, he wrote a history of the times 'De dissensionibus filiorum Ludovici pii ad annum usque 843,' which, though naturally partisan, is a valuable source for the study of early mediæval history. It is contained in the 'Monumenta Germaniæ Historiæ,' published by Pertz (1870); and was also published by Holder (1882), and in German by Jasmund (1889).

NITHSDALE, niths'däl, William Maxwell, 5th EARL OF, Scottish Jacobite: b. Scotland, 1676; d. Rome, Italy, 20 March 1744. He joined the Jacobites in 1715 and served under Forster and Derwentwater at Preston where he was captured. He was imprisoned in the Tower and sentenced to death, but assisted by his wife he made his escape in woman's clothing the night preceding the day set for his execution, and after remaining in hiding for two days, escaped to France, disguised as a footman in the livery of the Venetian ambassador. He was the "Willie" of 'Kenmure's up and awa'; and the story of his escape written by his countess will be found in 'Transactions of the Societies of Antiquaries of Scotland (Vol. I).

NITOCRIS, nī-tō'krīs, Egyptian queen, the last of the Sixth Dynasty. She succeeded her brother Menthuophis, whose assassination she avenged by drowning all who had any complicity in it. She was buried in the third in size of the greater pyramids, which she had enlarged. She was supposed by the Greek historians to be Rhodopis, "rosy-checked," a Greek courtesan, with whom the king fell in love from the sight of her lost slipper—the original of the Cinderella legend.

NITON, a chemical element generated by the element radium. It was discovered in 1900 by Dorn and called radium emanation. Gray and Ramsay gave it the name niton, from the Latin *nitere* to shine, in 1911. The molecular weight was determined by Perkins in 1908; by Debierne in 1910; and by Gray and Ramsay in 1911. All agreed that this weight is 222.4. Sir William Ramsay proved in 1912 that the curative value of the famous spring at Bath, England, is due to the niton contained in its waters. Niton liquifies at low temperatures and may, therefore, be isolated from its mixtures with helium. Pure liquid niton boils at 62° C. and 79.6° F.

"The proof that each atom of radium yields an atom of the gas helium," writes Dr. Leonard Keene Hirschberg of the Johns Hop-

kins University, "was settled for all time by Sir William Crookes and Professor Rutherford. They covered a screen with crystals of sulphate of zinc. As the miniature explosions take place during the escape of helium from radium, the helium is shot out with much force. As the atoms strike the screen, flashes of light appear. Those, of course, are the alpha rays, so called. After these particles of helium have broken away, the atom of radium is really radium no longer, but a gas which is now known as the new element *niton*. The rate of change of radium into *niton* progresses in a slow, geometrical disintegration. After a period of 1,760 years, one ounce of radium will have changed into half an ounce of niton and helium while one-half an ounce of unchanged radium will remain. Allowing another 1,760 years to elapse and one-half of the half ounce or a quarter of an ounce of radium will be changed to niton and helium. The next 1,760 years would make an eighth of an ounce change and an eighth of an ounce remain unchanged. Thus this curious half period of decay will go on indefinitely. Niton, like helium and argon, is practically inert. It forms no chemical salts or other compound, and its existence is temporary, lasting a little less than four days. To be exact, after 3.86 days it in turn disappears and changes into something new.

"Sir William Ramsay proved that 75 per cent of the wonderful powers of radium is due to niton. He has also shown that, like most other gases, niton is compressible and can be converted at room temperatures into a liquid by a simple compression. Pressed into a silica glass tube of very fine bore, it will become solidified into a microscopical stick of ice-like material. Though it cannot be seen, it causes a light in the tiny glass tube as brilliant as an arc-lamp.

"Liquid niton also causes a faint violet incandescence. In the dark it is most beautiful. The liquid itself, however, in a lighted room, appears quite clear. Ramsay and his assistant, Whytlaw Gray, found that the atomic weight of niton is equal to that of an atom of radium minus an atom of helium. Since radium is 228 and helium 4, niton has the atomic weight of 224. Like radium, niton decays in that curious geometrical ratio, called 'half-period of decay.' Thus, niton changes one-half in four days, in eight days a quarter of it is left, in twelve days an eighth, sixteen days, a sixteenth, twenty days a thirty-second, twenty-four days a sixty-fourth, so that practically at the end of one month it has all changed." Consult Ramsay, Sir William; RADIUM; RADIO ACTIVITY.

NITRATE OF SILVER, a compound of silver and nitric acid, having the formula AgNO_3 . It may be prepared by dissolving pure silver in warm nitric acid that has been diluted with two or three times its own weight of water. The solution is evaporated to dryness and the residue gently heated until all the nitric acid has been expelled, after which it is dissolved in water and crystallized; the silver nitrate being then obtained in the form of colorless rhombic tabular crystals. The commercial product is usually the result of the separating of silver from gold bullion, and in this case it often contains copper. This is removed by boiling with freshly precipitated silver oxide which throws down the copper in the form of

oxide. Nitrate of silver is readily soluble in water and in a somewhat less degree in alcohol. It melts at 424°F. , and when cast into sticks it constitutes lunar caustic, being used in this form as a cauterizing agent. Its cauterizing effect depends upon the fact that it forms, with the albumen of the flesh, an insoluble albuminate of silver. It is sometimes combined with two parts of potassium nitrate to form what is known as "mitigated caustic." Dry silver nitrate will absorb ammonia with the evolution of a degree of heat sufficient to melt it, and with the formation of the ammonio-nitrate of silver. Nitrate of silver, especially in the presence of organic matter, is blackened by exposure to light, and on account of this property it is used in the preparation of indelible inks for marking linen, and as a basis for dyes to color the hair black. It was much used in photography in the days of the old "wet-plate" process and is still employed in sensitizing some kinds of paper upon which positive pictures are printed. The black stains that it leaves upon the hands may often be removed by the application of cyanide of potassium; but it should be remembered that cyanide of potassium is a violent poison and that it must be used with extreme care.

Medical Uses.—Nitrate of silver is official in two forms, the heavy crystalline salt, readily soluble in its own weight of water, and the lunar caustic above mentioned. Applied to the skin, it produces a brownish-black stain due to the formation of chloride of silver, through combination with the sodium chloride of the perspiration. The crystals only are used internally either in pills or solutions. Nitrate of silver as ordinarily applied to an inflamed mucous membrane is more of an astringent than of an irritant. Applied locally as a caustic, its action is superficial, coagulating the albumen and so forming a protective coating. Internally it is used (combined with an anodyne) in gastric ulcer, gastritis, intestinal ulcerations and dysentery. Salt and soap checks its action. Externally in stick form, it has been used to prevent the pitting of smallpox. In solution it is employed to quiet the pain and relieve swelling in cases of felon, orchitis and epididymitis; in inflammation of the mouth, pharynx and larynx; in whooping cough, pruritus ani, bedsores, boils, granular lids, conjunctivitis, etc. Nitrate of silver should not be used internally for too long a time, as it is not readily eliminated from the body. Argyria or chronic poisoning is liable to result from such use of the remedy. See SILVER-POISONING.

NITRATE OF SODA, SODIUM NITRATE, or CHILE SALTPETER, a compound of sodium and nitric acid, having the formula NaNO_3 . It may be prepared by neutralizing nitric acid with sodium hydrate or sodium carbonate and evaporating the solution; but it occurs native and in large quantities, in the northern part of Chile and in the neighboring parts of Peru and Bolivia. Deposits of it are also known in Humboldt County, Nev., and in San Bernardino County, Cal. The Chilean deposits occur at a height of 3,300 feet above the sea, but they are undoubtedly of marine origin, since they contain the remains of recent shells. Nitrate of soda, as it occurs in nature, may be purified by repeated crystallization from its aqueous solution. It crystallizes

in rhombohedral forms and is isomorphous with calcite; but in nature it is usually found massive, or in beds, or as an incrustation. The crude substance is valuable as a fertilizer (see MANURES AND MANURING), and it is also used extensively as a source of nitric acid and of nitre (q.v.), and for the production of the cheaper grades of gunpowder.

NITRATES, salts of nitric acid. See NITRATE OF SILVER; NITRATE OF SODA; NITRE; NITRIC ACID.

NITRE, *nit'ér*, **NITER**, **NITRATE OF POTASH**, **POTASSIUM NITRATE**, or **SALTPETER**, a compound of nitric acid and potassium, having the formula KNO_3 . It occurs native in many places as an incrustation upon the soil, notably in Spain, Egypt, Persia and India. It is formed, either naturally or artificially, by the action of a nitrifying bacillus on decaying nitrogenous matter in contact with potassium compounds (see NITRIFICATION). It also occurs in considerable quantities in the caverns of Kentucky and Tennessee, and elsewhere along the Mississippi Valley. It is obtained on a commercial scale from these various sources, but it is also prepared in vast amounts from native nitrate of soda (q.v.). When hot concentrated solutions of nitrate of soda and potassium chloride are mixed, nitrate of potash and chloride of sodium (common salt) are formed, the latter separating out in the form of crystals when the solution cools, while the nitrate of potash remains in solution. Nitre has mild antiseptic properties and it is also used in dyeing, in metallurgy, in medicine (as a diuretic and diaphoretic), and in the preparation of fluxes. It is used in the arts most commonly, however, in the manufacture of gunpowder (q.v.). For "sweet spirits of nitre" see NITROUS ETHER.

NITRIC ACID (Latin, "from nitre"), in chemistry, a compound of nitrogen, oxygen and hydrogen, having the formula HNO_3 , and possessing strongly acid properties. It appears to have been discovered in the 9th century, by Geber, the "father of chemistry," who describes a method of preparing it by distilling a mixture of nitre, alum and copperas (sulphate of iron). The modern method of preparing it by the action of free sulphuric acid upon nitre was apparently first described by Glauber, about the middle of the 17th century. Lavoisier proved that the acid contains oxygen, and Cavendish, in 1785, succeeded in preparing nitre by passing electric sparks through a mixture of oxygen and nitrogen, in the presence of a solution of caustic potash. Free nitric acid occurs in rain-water in exceedingly small amounts, and its salts are formed, in the soil, by the bacterial oxidation of nitrogenous organic matter. (See NITRIFICATION). Commercially, nitric acid is manufactured by distilling sodium nitrate ("Chile saltpetre") with strong sulphuric acid. The sulphuric acid (H_2SO_4) unites with the sodium nitrate (NaNO_3) to form nitric acid (HNO_3) and acid sulphate of sodium (HNaSO_4), as indicated by the equation: $\text{NaNO}_3 + \text{H}_2\text{SO}_4 = \text{HNO}_3 + \text{HNaSO}_4$. When the temperature is sufficiently raised, the acid sulphate of sodium combines with another molecule of the sodium nitrate to form normal sodium sulphate (Na_2SO_4), another molecule of nitric acid being

liberated at the same time, as indicated by the equation:

The temperature is not always carried to the point where this last reaction occurs, however, because although the yield is larger, the product is more largely contaminated with objectionable impurities, and the residual "cylinder cake," or "nitre cake," left in the retorts, is harder to remove. The distillation is commonly carried out in iron retorts, iron not being seriously attacked by concentrated sulphuric acid. The nitric acid which distills off is washed by passing it through a series of double-necked iron bottles ("Woulfe's bottles"), containing, each, a small quantity of water. The distillate is finally condensed, then constituting the crude, fuming acid. Nitric acid, as thus manufactured, is yellowish in color, and contains, as its principal impurities, chlorine, hydrochloric acid, iodic acid, peroxide of nitrogen, sulphuric acid, sodium sulphate, and iron compounds—some of these being distilled over, and others carried over mechanically. Most of the impurities may be removed by re-distillation. A third distillation then follows, after the addition of an equal volume of concentrated sulphuric acid to retain the major part of the water. By this means a tolerably pure nitric acid can be had, though it is still yellowish from the presence of lower oxides of nitrogen. These may be removed by warming the acid slightly, and passing through it a stream of air, or (preferably) of carbon dioxide gas. Any nitrous acid that may be present may be removed by distillation with a small quantity of urea, which decomposes the nitrous acid with liberation of carbon dioxide, water and free nitrogen.

The method of manufacture described above is the usual one, but other methods are also used, and the Valentiner process, in which the distillation is conducted in a vacuum, is strongly favored by many modern manufacturers. (Consult Rogers, 'Industrial Chemistry'). Nitric acid and its compounds are also made by the oxidation of the nitrogen of the air (see NITROGEN), either by the direct action of the electric arc, or by catalytic combination at high temperature and pressure. The cost of manufacture by the electric arc method has been practically prohibitive in the past, except in Norway, Sweden and Switzerland, where the needful electric current can be generated very cheaply, by water power. The catalytic method is growing in favor, and during the war immense plants were constructed in the United States, at Muscle Shoals and elsewhere, to provide, by this and other synthetic methods, the nitric acid that was needed in the manufacture of explosives. Germany could not have conducted the war except for the fact that she was able to manufacture synthetic nitric acid in large quantities by the Haber process and modifications thereof.

Nitric acid, perfectly free from water, has not yet been prepared, although specimens have been obtained containing from 99.5 to 99.8 per cent of HNO_3 . When free from all impurities except water, nitric acid is a colorless liquid, which gradually decomposes in a strong light, with evolution of oxygen, water and nitrogen peroxide (N_2O_4) becoming yellow from the presence of the peroxide. The most highly concen-

trated acid freezes at about 50°F . below zero, and boils at about 187°F ., although it begins, below the boiling temperature, to decompose into nitrogen peroxide, water and free oxygen. Concentrated nitric acid may have a specific gravity as high as 1.552. Nitric acid was formerly known as "spirit of nitre," and (when diluted) also as "aqua fortis" (that is, "strong water"). It is an active oxidizing agent, especially when warmed, owing to the facility with which it parts with oxygen. When mixed with hydrochloric acid, it is known as "nitrohydrochloric acid," "nitromuriatic acid," or "aqua regia," the latter name being given on account of the power that the mixture has of dissolving gold. The powerful solvent action of nitrohydrochloric acid is due to the fact that it contains free chlorine gas, liberated from the hydrochloric acid by the oxidizing action of the nitric acid upon the hydrogen of the hydrochloric acid. Nitric acid and nitrohydrochloric acid are both used in medicine, in a highly dilute state, as appetizers and diuretics.

Nitric acid is used in large quantities in chemical industries of all kinds. It is of the greatest importance in the manufacture of the coal-tar colors, and of many of the modern high-power explosives. (See for example, NITROGLYCERIN and GUNCOTTON). In using strong nitric acid, either alone or mixed with sulphuric acid, great quantities of nitrous fumes are often liberated, and it is extremely important to protect the workmen from them. When nitrous fumes are inhaled (even though largely diluted with air) they cause strangulation and loss of consciousness—often followed, after seeming recovery, by fatal edema of the lung tissues, or at a later time by pneumonia. It is, therefore, customary to use the nitric acid, so far as possible, in closed tanks, and to transfer it from tank to tank through pipe lines, by means of gravity or air-pressure.

With the metallic bases, nitric acid forms a series of exceedingly important salts known as "nitrates." Practically all of the nitrates are crystalline and readily soluble, and they are characterized by marked decrepitation when heated upon charcoal before the blowpipe. Several of the nitrates are used in dyeing, notably those of aluminum, iron and lead. Aluminum nitrate, $\text{Al}(\text{NO}_3)_3$, may be prepared by dissolving aluminum hydrate in dilute nitric acid, and crystallizing by evaporation. It crystallizes in rhombic prisms which contain nine molecules of water, are readily soluble, and melt at 99°F . Ferrous nitrate, $\text{Fe}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$, is prepared by dissolving ferrous sulphide in dilute nitric acid, and slowly evaporating the solution at as low a temperature as possible. Ferric nitrate, $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$, crystallizes in rhombic prisms, and may be prepared by dissolving metallic iron in nitric acid, adding more acid, and finally cooling the solution. It is readily soluble in water, but nearly insoluble in cold dilute nitric acid. Normal lead nitrate, $\text{Pb}(\text{NO}_3)_2$, may be obtained in the form of octahedral crystals, by evaporating a solution of lead carbonate in dilute nitric acid. The nitrates of barium and strontium are used to a large extent in pyrotechny, on account of the beautiful colors that they yield. They may be prepared by adding, to the corresponding carbonates, not quite enough dilute nitric acid to decompose the whole of the salt, and subse-

quently filtering and crystallizing. See also NITRATE OF SILVER; NITRATE OF SODA; NITRE.

A. D. RISTEEN.

NITRIDES, in chemistry, compounds consisting of nitrogen and one other element. They are usually prepared by the action of ammonia upon metallic oxides or chlorides, but in some cases they may be prepared by the direct combination of free nitrogen with the other constituent. Hydrogen nitride or triazic acid has the formula N_3H . It forms salts with the metals. Its sodium salt is formed by treating the compound $NaNH_2$ with nitrogen chloride, NCl_3 . Triazic acid and its salts are highly explosive. Nitride of boron ("athogen"), for example, has the formula BN and is formed when boron is heated in nitrogen gas. Magnesium nitride, a crystalline substance having the formula Mg_3N_2 , is also formed when metallic magnesium is heated to redness in an atmosphere of nitrogen in the presence of calcium-carbide. Ramsay, Raleigh, Travers and others took advantage of this latter fact for effecting the absorption of the nitrogen of the air, in their researches upon argon, helium and the other rare gaseous elements of the atmosphere. (See ARGON). The nitrides of the metals are mostly decomposed by heat and sometimes with explosive violence. Magnesium nitride, however, is quite stable.

NITRIFICATION, the process by which nitrates are formed, either in the soil or elsewhere, by the putrefactive or fermentive decay of nitrogenous organic matter, or by the oxidation of nitrogen itself. It has long been known that nitrates are formed in the soil and in India, as well as in Spain and certain other parts of Europe, nitrate of potassium ("nitre") is still manufactured to some extent by mixing porous soil with manure and other organic refuse, adding wood ashes (as a source of potassium) and allowing the mass to stand in heaps for two years or so. Under suitable conditions of temperature and moisture, the yield may be as much as 10 pounds of crude nitre per ton of earth. Analogous changes go on, from year to year, in all fertile soil, and it was formerly believed that the natural conversion of nitrogenous matter into nitrates is due to the fact that the soil, by a sort of capillary action, condenses air within its pores; oxidation being thereby promoted because the air held by the soil, being denser than normal atmospheric air, contains more oxygen per unit of volume. In 1862, however, Pasteur suggested that nitrification is effected through the agency of bacteria, or other forms of microscopic life; and in 1877 Schlösing and Müntz established this view upon a firm foundation, by means of many ingenious experiments. It has also been further and most convincingly established by Warington, Munro, Winogradsky, P. F. Frankland, G. C. Frankland and others. It has been shown, for example, that nitrification is arrested by powerful antiseptics and that it proceeds most actively at about $100^\circ F.$, and less rapidly both at higher and at lower temperatures. Furthermore, if soil or sewage be raised in temperature to $212^\circ F.$, so as to destroy all life that may be present, nitrification at once stops, and it will not proceed again when the temperature is restored to $100^\circ F.$, even in the presence of

abundance of air that has been passed through germ-proof filters. If the sterilized mass be "sown" with the nitrifying agents, however, by the addition of a small quantity of unsterilized soil or sewage, nitrification is at once resumed, and thereafter proceeds normally. Certain conditions are essential to active nitrification, in addition to a suitable temperature, the free access of oxygen, and the actual presence of a sufficient number of the live and active organisms. It is essential, for example, that the soil or other medium in which the nitrification occurs shall be slightly alkaline, and this implies the presence of a base such as potash or carbonate of lime, in sufficient quantity to fix the nitric acid as it is formed; for if no such base is present, the medium soon becomes acid, so that the organisms cease their activities. It is usually held that some quantity of organic carbon must also be present, in order to furnish food for the nitrifying organisms; but it appears that this is not essential in all cases, because certain forms of life have been found to be capable of nitrifying inorganic solutions, obtaining their carbon from carbon dioxide gas. In the presence of a considerable amount of organic carbon, especially when the conditions are otherwise unfavorable to nitrification, an inverse process, known as "denitrification," is likely to result, such nitrates as happen to be present being thereby reduced to compounds that are less highly oxidized. Denitrification also appears to be due to the activities of special micro-organisms and whether the nitrates of a soil increase or decrease depends upon which of the two antagonistic kinds of organism is most highly favored by the conditions. Moisture is essential in both cases; but its absolute amount is of the greatest importance. Nitrification may be proceeding rapidly in a soil that is moderately moist and well aerated, and yet the same soil, when thoroughly waterlogged, may be a vigorously denitrifying medium. Nitrification proceeds best in the dark and strong light checks it in a marked manner, or even stops it altogether. In nature, nitrification is most active within a few inches of the surface of the ground, and it takes place only with exceeding slowness at a depth of two or three feet. Some micro-organisms transform nitrogenous compounds into compounds of ammonia, some transform ammoniacal salts into nitrites and some transform nitrites into nitrates. In nature it is probable that all these processes go on simultaneously. It was long believed that the free nitrogen of the air does not take part in the nitrification processes of the soil. It is now pretty generally admitted, however, that certain micro-organisms actually possess the power of absorbing free nitrogen and fixing it in the form of a chemical compound. We do not yet know how general this power may be, but it appears to be exhibited, beyond dispute, by some of the microscopic forms of life that live, perhaps parasitically, upon the roots of the pea and certain similar plants. Consult Conn, 'Agricultural Bacteriology' (Philadelphia 1909); Kellerman, in *United States Bureau of Plant Industry, Circular No. 113* (Washington 1913); Lipman, 'Bacteria in Relation to Country Life' (New York 1908); Löhnis, 'Handbuch der landwirthschaftlichen Bacteriologie' (Berlin 1910).

NITRILE, *in chemistry*, a compound which may be regarded as derived from ammonia, NH_3 , by replacing the three hydrogen atoms by a single trivalent organic radical. (Compare **AMIDE**). They have the general formula XC_n , where X represents methyl (CH_3), ethyl (C_2H_5), or some similar monovalent alcoholic radical, and they may therefore be regarded as alkyl cyanides. They may be prepared by distilling potassium-alkyl sulphates with potassium cyanide, the general reaction being $\text{XKSO}_4 + \text{KCN} = \text{K}_2\text{SO}_4 + \text{XC}_n$. A similar reaction takes place between alkyl palides and potassium cyanide. Acetonitrile, for example, which has the formula CH_3CN , may be prepared by distilling dry potassium-methyl sulphate, CH_3KSO_4 , with dry potassium cyanide, KCN . Acetonitrile is also known as methyl cyanide, and is a colorless, inflammable liquid with an ethereal odor, mixing readily with water and with alcohol, having a specific gravity of 0.80, and boiling at about 178°F . The nitriles can be hydrolyzed to form acid amides, the ammonium salts of organic acids, and finally the acids themselves. This, together with the fact that it is possible to replace a halogen atom in an organic compound by a cyanogen (CN) radical, furnishes a fertile method of synthesizing long chains of carbon atoms.

NITRITE OF AMYL. See **AMYL NITRITE**.

NITRITES, salts of nitrous acid (q.v.).

NITRO-BENZENE, or **NITRO-BENZOL**, a liquid chemical substance having the formula $\text{C}_6\text{H}_5(\text{NO}_2)$, which is formed by the action of fuming nitric acid upon benzene. See **ANILINE** and **BENZENE**.

NITRO-CELLULOSE, a compound of nitric acid with cellulose, in which the hydroxyl of the cellulose is more or less completely replaced by molecules of NO_2 . An exchange of NO_2 for OH always occurs when cellulose is treated with nitric acid, but the extent of the nitration depends upon the circumstances of the treatment. The nitro-celluloses are more properly described as "cellulose nitrates," and several of them are known. Those found in collodion pyroxyline and guncotton are the most important. The molecular formula of cellulose is not precisely known, but on the hypothesis that it is $\text{C}_{12}\text{H}_{20}\text{O}_{10}$, we may consider collodion pyroxyline as a mixture of the tetra-nitrate and trinitrate and guncotton as the hexanitrate, its chemical formula being $\text{C}_{12}\text{H}_{14}\text{O}_4(\text{NO}_2)_6$. See **CELLULOID**; **COLLODION**; **EXPLOSIVES**; **GUNCOTTON**.

NITRO-COMPOUNDS, *in chemistry*, compounds in which one or more atoms of hydrogen are replaced by an equal number of nitroxyl (NO_2) radicals, the nitroxyl radicals being directly connected with carbon by means of their nitrogen atoms. Many of the nitro-compounds are of great importance in the chemistry of coal-tar derivatives. Nitro-benzene, $\text{C}_6\text{H}_5\text{NO}_2$, for example, which is obtained by the action of nitric and sulphuric acids upon benzene, is the source from which commercial aniline is manufactured. (See **ANILINE** and **BENZENE**). Consult, also, Benedikt, 'Chemistry of the Coal-Tar Colors.'

NITRO-DYESTUFFS. See **COAL-TAR COLORS**.

NITRO-HYDROCHLORIC ACID, **NITRO-MURIATIC ACID**, or **AQUA REGIA**, a mixture of nitric and hydrochloric acids, formerly known as "aqua regia," or "royal water," on account of its power to dissolve gold. See **NITRIC ACID**.

NITROGEN. See **LIQUEFIED AND COMPRESSED GASES**.

NITROGEN FIXATION. See **ELECTRO-CHEMICAL INDUSTRIES**.

NITROGENOUS FERTILIZERS. See **FERTILIZERS**.

NITROGLYCERIN, or **GLONIN**, a powerful explosive discovered by Ascanio Sobrero in 1846, and first produced commercially by Emmanuel and Alfred B. Noble, at Helenborg, Sweden, in 1862. The process of manufacture was much improved by George W. Mowbray of North Adams, Mass., and Walter N. Hill of the United States Torpedo Station, at Newport, R. I., these improvements yielding a product of greater purity, and also overcoming many of the dangers attending the manufacture, transportation and use of the substance. Nitroglycerin is manufactured by treating glycerin with a mixture of concentrated nitric and sulphuric acids, but the proportions of the material used and the methods of operation are different in different countries. In the United States the acids are usually mixed in the proportion of two parts by weight of nitric to three parts by weight of sulphuric, so as to contain 61.9 per cent of real H_2SO_4 , 34.5 per cent of HNO_3 , and not more than 0.7 per cent of N_2O_5 . These "mixed acids" are shipped from the acid works in iron drums holding 1,500 pounds each, this weight being a convenient charge for one run in the nitroglycerin converter. The "converter" or "nitrator" is a closed cylindrical vessel of lead, standing within a wooden one. The mixed acids are introduced by a pipe at the top of the converter, and the glycerin is forced into the vessels at the bottom, by means of compressed air. The fumes produced by the reaction are carried off through a "fume pipe," which is provided with a window to view the gases. The reaction between the glycerin and the acids causes the evolution of considerable quantities of heat; and to prevent the temperature of the converter from rising to the danger point, cold water is continually passed through the space between the lead cylinder and the wooden one, and also through a cooling coil of lead pipe, which is placed within the lead cylinder. Compressed air is also injected directly into the mixture to aid in the cooling, and extra air pipes are provided, for use in case the rise of temperature cannot be controlled by the means that are normally sufficient. The temperature of the mixture is continuously observed, by means of sensitive, specially constructed thermometers, which enter the converter through the top. In operating the process, the mixed acids are run into the converter first, the cooling water is next turned on, and, lastly, the glycerin is slowly introduced at the bottom. When the materials are pure, and no particle of water is allowed to enter the mixture and the temperature is not permitted to rise above 86°F ., this part of the operation may be regarded as reasonably safe. In recent years this is ensured by the use of ice machines to cool the water and the mixture.

When the conversion is completed, the charge of the converter is run off into a "separator," which is a cylindrical leaden vessel provided with windows, with a vent pipe for the escape of vapors, and with an injector pipe, through which compressed air may be introduced for cooling purposes, in case any tendency toward rise of temperature is observed. When the charge is allowed to stand, the nitroglycerin rises to the top of the separator, and the spent acids, by reason of their greater density, sink to the bottom. The separation being nearly complete, the nitroglycerin is drawn off through an upper spigot, and the spent acids are drawn off at the bottom and passed to a second separator, for the removal of the last traces of nitroglycerin that they contain. A vessel called the nitrator-separator is now in use in which conversion and separation are both carried on. The nitroglycerin is now repeatedly washed with water, then with a solution of soda ash, and again with water, until the last traces of acid are removed from it. The spent acids are sent to the "regaining" works, where the sulphuric acid (which is not destroyed in the process) is recovered for further use. The small quantity of nitric acid that remains unused is also recovered in a dilute form, and used for other purposes. Theoretically, 100 parts by weight of glycerin should yield 246 parts of nitroglycerin; but the yield in the United States is only from 200 to 220 parts.

Nitroglycerin is also known as "glonoin," "Nobel's blasting oil" and "trinitroglycerin." It was originally supposed to be a nitro-substitution compound, like many other substances produced by the action of nitric acid upon organic compounds; and hence the name it now commonly bears. But Berthelot has shown that its reactions are those of a salt or ester of nitric acid, and its correct chemical name is now admitted to be "glyceryl trinitrate," or "propenyl trinitrate." "Glyceryl" or "propenyl" is the name of the organic radical C_3H_5 , and ordinary glycerin, $C_3H_5(OH)_3$, is the hydrate of this radical. Nitroglycerin has the formula $C_3H_5(NO_3)_3$, and is formed from nitric acid and glycerin in accordance with the equation $C_3H_5(OH)_3 + 3HNO_3 = C_3H_5(NO_3)_3 + 3H_2O$.

When chemically pure, glyceryl trinitrate is a colorless, odorless, transparent, oily liquid, but commercial nitroglycerin varies in color between a hock-wine and a dirty yellow. It has a specific gravity of 1.599 when liquid, and 1.735 when frozen. Kast and Hibbert find it, when pure, to exist in two crystalline forms. Hence it is tautomeric. The stable form freezes at $56^\circ F$. if exposed for a long time to this temperature, forming long, whitish crystals, and the labile form at $34.04^\circ F$. It boils at $293^\circ F$. It is slightly volatile at ordinary temperatures and according to Hess it volatilizes completely upon continuous exposure to a temperature of $158^\circ F$., and Guttman has found that dynamite (see below) loses 10 per cent of its nitroglycerin by an exposure of several days to a temperature of $104^\circ F$. Nitroglycerin is almost insoluble in water, but dissolves readily in wood alcohol, grain alcohol, ether, benzene and many other organic liquids. It undergoes dangerous decomposition with explosion upon contact with sulphuric acid (except under the condition of manufacture described above), and it is also de-

composed by alkalis and by alkaline sulphides. The safest way to destroy it is by treating it with a solution of ammonium sulphide, or, where the quantity is large, with spent lime from the purifiers of gas works. Nitroglycerin has a sweetish, burning taste, and is poisonous, producing extremely violent headaches when taken by the mouth, absorbed through the skin or inhaled as vapor; though some persons, by constant association with it, become immune to its physiological effects. The antidotes are cold compresses, fresh air, black coffee and morphine. It is used in medicine as a heart stimulant, in the treatment of angina pectoris, in the revival of the drowned and as an antidote in cases of poisoning by carbon monoxide and water gas.

Nitroglycerin begins to decompose at $122^\circ F$. and at $158^\circ F$ it will react to the Abel test in 15 to 20 minutes. At $293^\circ F$. it may be distilled and at $424.4^\circ F$. it explodes. Pure nitroglycerin is not very sensitive to friction or moderate percussion, except when pinched between metallic surfaces, or struck a glancing blow. If placed upon an anvil and struck with a hammer, only the particle struck, as a rule, explodes, the remainder being scattered; but this is an unsafe experiment to try with a quantity of the explosive, because in some cases the whole mass will be exploded. Frozen nitroglycerin is in general less sensitive to shock than the liquid, but explosions have occurred which were believed to be due to the breaking of a crystal of the solid substance. When a small quantity of nitroglycerin is freely exposed to a flame, it burns brilliantly and without explosion; but when the experiment is tried with a larger quantity, explosion is likely to follow. A drop of nitroglycerin, when placed upon an iron plate and slowly heated, may volatilize completely without exploding; and if the drop is placed on an iron plate that is previously heated to incandescence, it will assume the spheroidal condition and volatilize without explosion; but if the plate be heated to a temperature just below incandescence the drop explodes violently upon contact with it. Nitroglycerin was at first exploded, in blasting, by means of a gunpowder fuse, and this method is still used to a limited extent with dynamite; but it is chiefly fired by means of a powerful detonator, by which its greatest explosive efficiency is realized.

Commercial nitroglycerin is not pure. It may contain among other impurities mono- and dinitro-glycerins and tetra-nitropoly glycerin.

Nitroglycerin is principally used in the manufacture of dynamite, explosive gelatine, gelatine dynamites and smokeless powders such as ballistite and cordite. The liquid substance is used in torpedoes for oil wells, to remove the paraffin which clogs them or to shake the oil-bearing sandstone so as to secure a better flow of oil. Owing to the difficulty and danger of transporting and handling liquid nitroglycerin, attempts were early made to absorb the liquid by means of some substance which would not interfere with its explosive action, but which would form with it a solid body, or a powder, which could be handled more conveniently and safely. Many such absorbents have been tried, charcoal being the first; but Nobel found that a kind of infusorial earth, consisting chiefly of

the silicious remains of diatoms and known as "kieselguhr," is much superior to charcoal, and this substance is now largely used as an absorbent, in the manufacture of common "dynamite." Sawdust, especially in combination with certain chemical substances, is used as an absorbent to a considerable extent. "Dualin," for example, is a mixture of 50 parts of nitroglycerin, 30 of sawdust and 20 of saltpetre, and "Atlas powder" and "Hercules powder" consist of nitroglycerin, carbonate of magnesia, wood fibre and sodium nitrate. "Blasting gelatine," invented by Alfred Nobel, consists of nitroglycerin gelatinized by the addition of nitrated cotton fibre; its manufacture being based upon the fact that a mixture of mononitro-cellulose and dinitro-cellulose, when free from unnitrated cotton and from trinitro-cellulose ("gun-cotton"), dissolves in warm nitroglycerin with the formation of a gelatinous substance. "Gelatine dynamite" consists of a mixture of thin blasting gelatine with wood meal and saltpetre.

Because of the low freezing point of nitroglycerin the dynamites made from it are prone to freeze at natural temperatures. Frozen dynamite is difficult to handle and explodes with detonators and thawing it is a dangerous operation. To avoid this low freezing, dynamites known as L. F. dynamites have been invented, in which nitrobenzenes, nitrotoluenes, nitronaphthalenes and substances of an analogous nature have been incorporated and now are quite widely used.

G., 'Nitro Explosives' (2d ed., ib. 1906); Marshall, Arthur, 'Explosives' (Philadelphia 1917); Snelling and Storm, 'Behavior of Nitroglycerin when Heated' (United States Bureau of Mines, 1912).

CHARLES E. MUNROE.

NITROSO-DYESTUFFS, or QUINONE-OXIMES. See COAL-TAR COLORS.

NITROUS ACID, an acid which has the formula HNO_2 , but which is too unstable, in the free state, to admit of isolation. A blue, aqueous solution of it may be prepared by dissolving nitrogen trioxide in ice-cold water (see NITROGEN); but when this solution is warmed the nitrous acid decomposes into nitric acid, nitric oxide and water, as indicated by the equation $3\text{HNO}_2 = \text{HNO}_3 + 2\text{NO} + \text{H}_2\text{O}$. The salts of nitrous acid (which are known as "nitrites") are more stable, and certain of them occur in the soil as a result of the oxidation of organic matter. (See NITRIFICATION). The nitrites of the metals are mostly soluble in water and in alcohol, their solutions being decomposed by boiling, or by the addition of dilute sulphuric acid. Potassium and sodium nitrites may be prepared by melting the corresponding nitrates with metallic iron, and crystallizing from solution in water. Silver nitrite, AgNO_2 , may be prepared by heating starch with nitric acid, passing the resulting gas into a solution of caustic potash, neutralizing this with acetic acid, and finally adding a solution of silver nitrate. It crystallizes in small white crystals, is one of the most insoluble nitrites, and may be used in the preparation of many of the others. Ammonium nitrite, NH_4NO_2 , for example, may be

obtained by adding a solution of silver nitrite to one of ammonium chloride (sal ammoniac). Nitrite of ammonium is used as a source of nitrogen, since it is decomposed by the action of heat into water and free nitrogen. Many of the organic derivatives of nitrous acid are also of importance. (See, for example, AMYL NITRITE and NITROUS ETHER).

NITROUS ETHER, or **ETHYL NITRITE**, the nitrite of the organic radical "ethyl." It has the chemical formula $\text{C}_2\text{H}_5\text{NO}_2$, and is usually prepared by acting upon ethyl alcohol with nitric acid. It is a yellowish liquid having a specific gravity of about 0.90, and boiling at 64°F . It mixes readily with alcohol, but only to a slight extent with water. It decomposes when kept in contact with water, evolving nitric oxide (NO). When mixed with about 20 times its own volume of alcohol (rectified spirit), it is known as "spirit of nitrous ether," or "sweet spirit of nitre," and is used in this form as a diuretic, diaphoretic and febrifuge, and for angina pectoris.

NITROUS OXIDE, or **NITROGEN MONOXIDE**, a gaseous substance having the chemical formula N_2O , and obtained by heating ammonium nitrate, NH_4NO_3 , as indicated by the equation

Care must be exercised in its manufacture, as ammonium nitrate, when heated, is liable to explosive decomposition. Nitrous oxide is a colorless gas, with a slightly sweet taste. It supports combustion nearly as well as oxygen, and when subjected to a pressure of 30 atmospheres at 32°F , it condenses into a colorless, mobile liquid. When inhaled, it is apt to produce exhilaration, for which reason it is commonly called "laughing gas." Sir Humphry Davy, in experimenting with nitrous oxide about the year 1801, discovered that it produces insensibility when inhaled for a sufficient time, and in recent years it has been used as an anæsthetic for dental work and other minor surgical operations. Davy himself suggested this use in the following words: "As nitrous oxide, in its extensive operation, seems capable of destroying physical pain, it may probably be used with advantage in surgical operations in which no great effusion of blood takes place." It does not appear that the gas was so used, however, until 1844. On 10 December of that year Dr. Gardiner Q. Colton gave a lecture on "Laughing Gas," in Union Hall, Hartford, Conn., administering the gas to several of his auditors, for the purpose of illustrating its peculiar properties. Horace Wells, a Hartford dentist, was present at the lecture, and was impressed by the practical possibilities that appeared evident to him. On the following day Wells obtained a supply of the gas from Colton, inhaled it himself until he became unconscious, and while he was in this condition Doctor Riggs extracted one of his teeth. When consciousness returned, a few minutes later, he exclaimed, "I didn't feel it! The greatest discovery of the age!" About the same time Dr. William T. G. Morton and Dr. Chas. T. Jackson, of the Massachusetts General Hospital, at Boston, introduced ether as an anæsthetic, and a patent for its use was issued to them in November 1846. There has been much bitter controversy concerning the priority of Wells and of Morton and Jackson,

as regards the introduction of anæsthetic methods in surgery; but so far as nitrous oxide is concerned, the evidence appears to favor Wells. Morton and Jackson experimented chiefly with ether, a substance which Wells appears to have used in his practice only upon one occasion. Nitrous oxide acts by causing partial asphyxiation and by a direct action on the nervous system. It raises the blood-pressure, and so should not be used where fatty heart or a diseased condition of the blood-vessels exists. Nitrous oxide is notable in that it leaves no bad after effects, and that it is not so unpleasant to take as most other anæsthetics. It is sometimes used as a primary anæsthetic for major operations, being followed by ether or chloroform. See LIQUEFIED AND COMPRESSED GASES.

NITTIS, nî'tès, **Giuseppe de**, Italian painter, etcher and engraver: b. Barletta, near Naples, in 1846; d. Paris, 22 Aug. 1884. After studying at the Naples Academy he went to Paris and placed himself under Gérôme and Meissonier. Soon he became influenced by Manet and turned from landscapes and genre to the painting of scenes of out-of-door Parisian life and other subjects of the Impressionist School. From 1879 he cultivated the art of pastel painting. His London pictures took the same rank as his Parisian studies. Nittis was distinguished for his observation, fine taste, skill in drawing, transparency of color, atmospheric effects and beautiful women. His etchings, engravings and water colors are highly valued. He received the third class medal at the Paris Salon in 1876, the first class in 1878, and was given the Legion of Honor in 1878. His best works include 'Road from Naples to Brindisi'; 'Descending Vesuvius'; 'Place de la Concorde, Paris'; 'Place des Pyramides, Paris'; 'Luxembourg Museum'; 'Boulevard Haussmann, Paris'; 'In the Bois de Boulogne, Paris'; 'Place du Carrousel, Paris'; 'At the Races'; 'Westminster, London'; 'Cannon Street, London,' and 'The Victoria Embankment, London.' Consult Renan, A., 'Joseph de Nittis' in *Gazette des beaux-arts* (Paris 1884); Burty, Ph., 'J. de Nittis' in *L'Art* (Paris 1880); Lostalot, Alfred de, 'Les pastels de M. de Nittis au cercle de l'Union artistique' in *Gazette des beaux arts* (Paris 1881); 'Une eau-forte inédite de J. de Nittis' in *Gazette des beaux arts* (Paris 1913); and Pica, Vittorio, 'Guiseppe de Nittis e la scuola napoletana di pittura' in *Emporium* (Bergamo 1914).

NITZSCH, nî'tsh, **Karl Immanuel**, German theologian: b. Bornä, Germany, 21 Sept. 1787; d. Berlin, Germany, 21 Aug. 1868. He was a son of Karl Ludwig Nitzsch and was educated in Wittenberg, becoming professor of a theological seminary in Berlin in 1817 and in 1822-47 he was professor at Bonn. He then returned to Berlin where he was professor and rector, university preacher and a member of the high consistory. He was one of the foremost advocates of the Evangelical Union, and was of moderate views and ethical rather than dogmatical in his teaching. He published 'System der Christlichen Lehre' (1829; Eng. trans. 1849); 'Praktische Theologie' (3 vols. 1847-67), etc.

NIU-CHUANG, nū-chwäng', **NEW-CHWANG**, or **YING-TSE**, China, a city of Manchuria, on the left bank of the Liao-ho

River, formerly at its mouth, but owing to silting up, now about 14 miles from its mouth. It is practically an inland city, but was chosen as one of the ports to be opened to foreign commerce by the treaty of Tien-tsin (1858). Pop. varies from 70,000 to 100,000. The foreign settlements and the trade, however, are at Ying-tse, near the river's mouth, which is known to Europeans as Niu-chuang. The port is connected by railway with Tien-tsin, and also with the great Siberian Railway. Though closed by ice in the winter months, it carries on an important trade. Ying-tse imports cotton, woolen and silk goods, sugar, paper, metals, opium, tobacco, etc. Large quantities of salt are manufactured in the vicinity and there are also coal mines. The port was captured by the Japanese in March 1895, and was part of the territory ceded to Japan which the latter power afterward relinquished. It was occupied by the Japs during the Russo-Japanese War in 1904, and, while nominally Chinese, is in reality under Japanese control. See MANCHURIA. Pop. 54,380.

NIUE, nē-oo'ā, **NIUE-FEKAI**, or **SAVAGE ISLAND**, in the South Pacific Ocean, politically dependent to New Zealand since 1901, is of ancient coral formation, 14 miles long, 10 miles wide, with a maximum altitude of 200 feet, and an area of about 100 square miles. The soil is very productive, yielding coconuts, taro, yams and bananas. Copra fungus and straw hats are exported. Pop. 3,943, Malayo-Polynesians, all Christians, due to the labors of the London Missionary Society.

NIVELLE, nē-vèl', **Robert Georges**, French general: b. Tulle, 1856; d. Paris, 21 March 1924. His father was an army officer and his mother was an Englishwoman, a Miss Pennington. He was educated at Saint Cyr and the École Polytechnique in Paris. He appears to have adopted all three branches of the service, being equally an expert in artillery, cavalry and infantry. His first active service years were spent in China and the French possessions in Northern Africa. Before the absorption of Korea by Japan Nivelle was sent on a special mission to Seoul. At the outbreak of the European War Nivelle was a colonel. He distinguished himself during the Charleroi retreat and again at the battle of the Marne. He was made general of brigade in October 1914 and a few weeks later was placed in command of the 61st Infantry division. The German Crown Prince's onslaughts at Verdun gave General Nivelle his great opportunity. As General Pétain's right-hand man he contributed more than anyone else, with his consummate skill in handling artillery, to the successful defense of the right bank of the Meuse. When General Pétain left Verdun to command the central group of armies his mantle naturally fell upon General Nivelle, whose brilliant continuation of the defense of Verdun is already an epic of the great war. It was on 23 June 1916, during the second battle of Verdun, that General Nivelle issued the order which gave rise to the famous expression, "Ils ne passeront pas" (They shall not pass!). Equally remarkable with the defense was the subsequent recapture by Nivelle's army, inside of a few days, of nearly all the ground that the Germans had taken in six months at the cost of half-a-million men. In December 1916 General Nivelle succeeded General (Marshal) Joffre in the com-

mand on the French front with the title of "Commander-in-Chief of the Armies of the North and the East." He held that post till May 1917, when he was placed in command of a group of armies and General Pétain became Commander-in-Chief. See WAR, EUROPEAN: VERDUN CAMPAIGN.

NIVELLES (Nyvel in Flemish), Belgium, town in the province of Brabant, on the Thines River, 19 miles south of Brussels. A convent founded here in the 7th century by Ita, wife of Pepin of Landen, is supposed to have been the foundation of the town. On its site stands the Romanesque church of Saint Gertrude, named for Ita's daughter, dating from the 11th century. It has two choirs and on the high altar stands the beautiful 13th century reliquary of Saint Gertrude (died 659), to whom the church is dedicated. The treasury possesses an ancient crystal goblet said to have belonged to the saint. The tower was restored in 1859 after a fire. On the top stands a man of iron who strikes the hours with a hammer, representing Jean de Nivelles, a celebrated baron of the 15th century, whose title eventually became merged into that of the Count of Horn. At Nivelles the French under Marceau defeated the Austrians in 1794. Nivelles was, prior to the War 1914-18, a busy little town with manufactures of parchment, paper, cotton, lace, carpets, furniture, agricultural implements, art goods, and a considerable trade in grain and livestock. The town also has a railway repair shop. Portions of the town were destroyed by the Germans. Pop. 12,624.

NIVEN, William, American mineralogist: b. Bellskill, Lanarkshire, Scotland, 6 Oct. 1850. After a common-school education in Scotland, he came to the United States in 1879, and pursued mineralogical investigations. He discovered four new minerals,—yttrialite, thorogummite and nivenite in Llano County, Texas, in 1889, and aguilrite at Guanajuato, Mexico, in 1891. In 1891 he also found the remains of a prehistoric people, covering several hundred square miles in the state of Guerrero, Mexico, also discovered a buried prehistoric city beneath the Valley of Mexico comprising over 2,000 square miles in September 1911. He was assistant commissioner of Arizona to the New Orleans Exposition. He is a member of the American Museum of Natural History and of the New York Academy of Sciences.

NIVENITE, a variety of the mineral uraninite, high in uranium and carrying 10 per cent or more of ytterbium earths and 6.7 to 7.6 per cent of thoria. Occurs sparingly with other rare minerals at Baringer Hill, Texas.

NIVERNAIS, nē-vēr-nā, France, an ancient central province corresponding nearly to the present department of Nièvre, held by the Counts (afterward Dukes) of Nevers.

NIX, or **NIXIE**, in German folk-lore, the name of water spirits (male and female), haunting rivers, brooks, ponds and lakes, and occasionally passing into the form of a horse or fish. See also NICKER.

NIXON, John, American military officer: b. Framingham, Mass., 4 March 1725; d. Middlebury, Vt., 24 March 1815. In the expedition against Cape Breton in 1745 he fought under

Sir William Pepperell and was at the capture of Louisburg. He joined the colonial forces at the outbreak of the American Revolution and fought at the battle of Lexington, and at Bunker Hill he commanded a regiment. He was made brigadier-general in 1777 and was given command of Governor's Island in New York harbor. He served under General Gates in the battle of Stillwater, and retired in 1780.

NIXON, John, American soldier: b. Philadelphia, Pa., 1733; d. there, 31 Dec. 1808. He was early prominent in opposing the taxation demands of England, and in 1774 became a member of the first committee of correspondence in Pennsylvania; and was also a member of the committee of safety. In 1775 he became lieutenant-colonel of a battalion which he led at the battle of Princeton in 1777. In 1776 he commanded at Fort Island, and later in the same year was placed in command of the guard of the city of Philadelphia; he was the first to publicly proclaim the Declaration of Independence in the city on 8 July. He served in the army till 1780, and was a member of the navy board and director of the provision supply. He was one of the organizers of the Bank of North America, and its president from 1792 to 1808.

NIXON, Lewis, American shipbuilder: b. Leesburg, Va., 7 April 1861. He was graduated from the United States Naval Academy in 1882, and was then sent to the Royal Naval College at Greenwich, England, to take a special course in naval architecture from which he was graduated in 1885. In 1884 he had been appointed to the construction corps of the navy, and on his return from abroad was ordered to duty in connection with the building of the cruisers *Chicago* and *Boston*; he was later superintending constructor for the navy at the Cramp shipyard, and assistant constructor at the Brooklyn Navy Yard. In 1890 he designed the battleships of the *Indiana* class, and when the contract for these vessels was awarded to the Cramp shipyard, he resigned from the navy to become superintending constructor there. He retained this position until 1895, when he leased the Crescent shipyard at Elizabeth, N. J., where he built 100 vessels within six years, including the sub-marine torpedo boat *Holland*. In 1902 he became president of the United States Shipbuilding Company, which includes the Crescent shipyard, the Eastern Shipbuilding Company, and others; and he is also connected with other manufacturing interests. In politics he has been allied with the Democratic party; was appointed a commissioner of the East River Bridge in 1898; and in November 1901 succeeded Richard Croker as leader of Tammany Hall, resigning the position in May of the next year; he has also been chairman of the finance committee of the Democratic Congressional Campaign Committee. He was made commissioner of public works for Richmond Borough, New York City, in 1914. In 1919 he became State Commissioner of Public Works and later Commissioner of Public Utilities of New York City. He is the author of 'The Canal Tolls and American Shipping' (1914).

NIXON, Oliver Woodson, American journalist: b. Guilford County, N. C., 25 Oct. 1825; d. 1905. He was graduated from Farmers' College, Ohio, in 1848, and from Jefferson Medical College, Philadelphia, in 1854. During the Civil

War he was medical director of the Army of Missouri and in 1870 established the Cincinnati *Evening Chronicle*. With his brother, W. P. Nixon (q.v.), he merged it with the Cincinnati *Times*, and in 1878 they purchased the *Inter-Ocean* of Chicago, of which he was for many years literary editor. He published 'How Marcus Whitman Saved Oregon for the Union' (1895).

NIXON, William Penn, American journalist: b. Fountain City, Wayne County, Ind., 19 March 1833. He was graduated from Farmers' College, Ohio, in 1854 and from the law school of the University of Pennsylvania in 1859. He practised his profession in Cincinnati till 1860 and sat in the Ohio legislature 1865-68. He was business manager of the Cincinnati *Chronicle*, 1868-72, after which he was associated with the Chicago *Inter-Ocean*, which he purchased with his brother O. W. Nixon (q.v.) as publisher, manager and editor. In 1897 he was appointed collector of the port of Chicago. He was president of the Associated Press for several years, was a delegate at large to the Republican National Convention of 1896.

NIZA, nē'sā, Marcos de (also called FRAY MARCOS), Italian missionary in America: b. Nice at the beginning of the 16th century; d. between 1550 and 1570. He gets his name, de Niza, from the city of Nice, where he lived and entered the Franciscan Order. His governor-general Antonio de Mendoza, on the request of Marcos' bishop and friend Bartolome de las Casas, sent him about 1531 to New Galicia in order to reassure the Indians there that the purpose of the Spaniards was simply to convert the natives, not to enslave or conquer them. Fray Marcos lived successively in Peru, Guatemala and Mexico, and in 1539 undertook to explore the Northwest and to discover the truth of the story told by Cabeza de Vaca of the seven cities of Cibola and their golden wealth. Niza probably made his way into Arizona, and is frequently called the "discoverer of Arizona." Upon his return he published a book locating the "seven cities," for which he must have mistaken the Zuñi pueblos. But the hopes to which he roused Mendoza were shattered by the expedition led by Coronado in 1540, which found no gold in Cibola. Previously Niza had become provincial of his order and was a member of Coronado's expedition to New Mexico and Arizona in 1540. Niza's 'Descubrimiento de las siete ciudades' was edited by Ramusio, but is most accessible in a French version. (1838).

NIZAMI, nī-zā-mē' (full name ABU MOHAMMED BEN YUSUF SHEIK NIZAM-ED-DIN), Persian poet: b. Western Persia, 1141; d. Ganjah, 1203. Besides a 'Divan,' or collection of lyrics, he wrote five larger poems, upon which his poetic fame rests, and which in Persia are regarded as masterpieces. These poems are (1) 'Makhzan-al-asrar' ('Storehouse of Mysteries'), a didactic poem, in which theoretical doctrines as to ethics alternate with historical details, anecdotes and fables; (2) 'Khusrau and Shirin,' a romantic epic, which has for its subject the love of the Persian king Khusrau for Shirin; (3) 'Laila and Majnun,' which describes the love of Majnun, a son of the Arabian desert, for the beautiful Laila; (4) 'Haft Paikar' ('Seven Portraits'), a collection of

seven novels in a kind of poetical heptameron. The most famous of these tales is the fourth, called Turandocht, which, after being subjected to various changes, furnishes the materials of Gozzi's and Schiller's well-known dramas; (5) 'Iskandar Namah' ('Alexander Book'), a traditional and embellished history of Alexander the Great, taken from the Greek poem on that subject by the pseudo Callisthenes. These five have been assembled in a collection known as 'Panj Ganj' ('The Five Treasures'). Nizami is not so familiar to westerns as Firdausi, Hafiz, or Sa'di; but in Persia he is among the foremost classics, and, in his peculiar field, may be placed second to Firdausi. 'Laila and Majnun' was rendered into English couplet verse by Atkinson (1836) and others of his works have been translated. Consult the 'Life and Works' in 'Persian Poets for English Readers' (1883).

NIZAM'S (nī-zāmz') DOMINIONS. See HYDERABAD.

NIZHAN, nyē'zhän, or NYEZHIN, nyē'zhēn, Russia, city in the government of Chernigov; on a branch of the Desna which flows into the Dnieper. It is in a fertile agricultural region in which tobacco is one of the principal products. It has a large trade in grain and tobacco. Pop. 33,000.

NIZHNI-NOVGOROD, nēzh'nī-nōv'gorod. See NIJNI NOVGOROD.

NIZHNI-TAGELSK, ta-gül'sk, Russia, also known as Tagil, town in the government of Perm, 88 miles northwest of Ekaterinburg and 130 miles east of Perm, to which cities it is connected by railroad. The town, beautifully situated in a valley on the eastern slope of the Ural Mountains at the junction of the Tagil, Tura and Salada rivers, is in a region rich in deposits of gold, copper, iron and platinum. It was founded in 1725 by Nikita Demidor, who established an iron foundry here. The town contains many iron and steel mills, and although its chief industry is mining, there is an enterprising trade in various articles of native manufacture, particularly wooden boxes and trays which are sent to the fairs of Irbit and Nizhni Novgorod. The inhabitants are nearly all Great Russians. Pop. 45,000.

NIZHNI TCHIRSK, South Russia, a town in the province of the Don Cossacks, on the right bank of the Don, 210 miles northeast of Novocherkask. The chief productions are wool, grain and cattle. Vineyards are plentiful in the neighboring country. An important annual fair lasts 10 days. Pop. 16,300.

NJORD, nyērd, in mythology, god of the wind and waves. See SCANDINAVIAN MYTHOLOGY.

NO AMMON, or NO, the Hebrew designation for Thebes, the Disopolis Magnus of the Greeks. It is mentioned in Nah. iii, 8 (μέρος Ἀμμών) and in Ezek. xxx, 14-16; Jer. xlv, 25 (Διόσπολις). The shorter form, No, seems to have prevailed generally among the Hebrews, and the Assyrian records call the city Ni, while in Egypt after the 21st dynasty it is written Nt, doubtless pronounced ne-t. Nahum's reference to it as "part of Ammon" makes its identity with Thebes positive. See THEBES.

NO-BODY CRAB, or SEA-SPIDER. See PANTOPODA.

NO MAN'S LAND, a name applied to outlying districts in various countries; at one time to what is now mainly Griqualand East; also to a territory of 80,000 square miles in South Australia; to a small island near Martha's Vineyard, Mass.; to a strip of land bordering on Pennsylvania, Delaware and Maryland, still in dispute between those States because of the displacement of the early boundary stones. Most commonly, however, the name is applied to Oklahoma in the following connection: In 1845 Texas, on being admitted into the Union, ceded to the United States that strip of her land which lay north of lat. 36° 30' N. This piece, 167 miles by 35, was without government until 1890, when it became a part of Oklahoma. At one time there was a great rush of prospectors and settlers to this section. The term "No Man's Land" was also employed during the Great War to designate the ground lying between the front line trenches of the opposing armies.

NO NAME, a novel by Wilkie Collins (q.v.) published in 1862.

NOACHIAN (nō-ā'kī-ān) **PRECEPTS**, seven canons or laws which, according to the Talmud, were given by Jehovah to the sons of Noah, and embodied the duties of Gentiles living under Jewish rule. These Precepts are analogous to what among the Romans was classed as Natural Law or *Jus Gentium*, a code revealed by the consensus of conduct among the Mediterranean nations. The seven Noachian Precepts enjoin: 1. Submission to civil authorities, kings, judges, etc. 2. Avoidance of idolatry and sacrilege. 3. Reverence to the name of God, as in taking an oath. 4. Proper restraint and direction of the human sexual instinct. 5. Reverence for life, even of animals, by refusing to consume the blood of beasts as food. 6. Respect for the rights of property. 7. Refusal to eat the member of a living animal. The expanding and refining genius of the Rabbins added others, and by the 3d century A.D., there were 30, the principal additional four being: 1. The blood of a living animal is not to be drawn for the purpose of drinking it. 2. Animals are not to be mutilated. 3. Magic and sorcery are unlawful. 4. The crossing of animals and grafting of trees are also unlawful. No stranger was allowed to dwell in Hebrew territory unless he conformed to the Noachian Precepts and became a "proselyte of the gate"; in contradistinction to the strangers who conformed by being circumcised, and were styled "proselytes of righteousness."

The Gentile who faithfully obeyed the Precepts "belonged to the pious among the nations and had a portion in the world to come."

NOAH, nō'ā, according to the Hebrew Scriptures, the son of Lamech, and 10th in descent from Adam. He was the first ancestor of the new race of men who should people the earth after the flood, in which points he is the counterpart of the Chaldaic Xithuthros, the Hindu Prithu, and the Greek Deucalion, severally. We read nothing of him from his birth till he is 500 years old, when we are told that he begat three sons, Shem, Ham and Japheth. Having been warned by God of the coming flood, he built an ark or great vessel by the direction of Jehovah, into which he entered with

his family and a number of animals of every kind. After the waters had subsided the ark rested on Mount Ararat, where Noah offered a burnt-offering to God, and was assured that the earth should never again be destroyed by a flood. This is the first passage in the Bible where altar or burnt-sacrifice is mentioned. As a sign of this covenant with Noah, God set the rainbow in the clouds. Noah died at the age of 950 years, 350 years after the flood. Recent scholarship is inclined to believe that in the narrative (Gen. v-ix) material from two different sources has been joined together: Up to ix, 17 Noah appears as the hero of the flood; and from verses 20-27 as the discoverer of the art of making wine, and the first to fall a victim to intoxication. Taken as a whole the narrative marks several important points in the history of civilization. In agriculture, the recognition of such seasons as seed time and harvest; and the discovery of the vine, which is made such a salient point in Greek mythology; the institution of sacrificial worship; the institution of civil government. The Noachian Precepts (q.v.) are founded on Genesis ix, 1-17.

NOAH, Mordecai Manuel, American politician and journalist: b. Philadelphia, 19 July 1785; d. New York, 22 May 1851. In early life a clerk in the government service and afterward a sessional reporter in the Pennsylvania legislature, he was in 1813 appointed United States consul at Tunis, with a special mission to Algiers. He succeeded in ransoming the American prisoners whom the Algerians held in slavery, but was recalled on the pretext that his religion was incompatible with his consular position at Tunis. He was abundantly vindicated later. In those days the United States paid a yearly tribute of \$200,000 to Tunis for the privilege of navigating the Mediterranean. Noah denounced such payment, insisting that the money would be better spent in building war ships. Settling in New York City in 1819 he published a volume of his 'Travels in England, France, Spain and the Barbary States,' and founded the *National Advocate*. In 1822 he was elected high sheriff of the city and county of New York. After the discontinuance of the *National Advocate*, he began the *New York Enquirer* which was merged with the *Courier* and became the *Courier and Enquirer*, in partnership with James Watson Webb, but political differences soon dissolved their connection. Appointed by President Jackson surveyor of the port of New York, he established in 1834 the *Evening Star* and became judge of the Court of Sessions. In 1842 he started a daily, *The Union*, which became a weekly and under the title, *Noah's Sunday Times and Messenger*, was edited by him until his death. A project in which he engaged in 1820 was to re-establish the Jewish nation and form a place of refuge for Jewish emigrants on Grand Island, in the Niagara River, near Buffalo. In 1825 with impressive ceremonies, he laid the cornerstone of the proposed city at White Haven, but the new "Ararat," as it was termed, came to naught. Noah's literary activity was varied; it included a large number of addresses and essays, a translation of the 'Book of Yashar,' and many plays, some of them popular in their time. Consult Wolf, 'Mordecai Manuel Noah: A Biographical Sketch' (1897);

Morais, 'Eminent Israelites of the 19th Century' (1886), and his own 'Gleanings from a Gathered Harvest' (1845).

NOAH, Samuel, American soldier: b. London, England, 19 July 1779; d. Mount Pulaski, Logan County, Ill., 10 March 1871. Of Jewish descent and a cousin of M. M. Noah (q.v.), at 20 he emigrated to America, and was appointed 5 May 1805 cadet in the First regiment of artillery. He was graduated 9 Dec. 1807, was promoted ensign in Second regiment and after desultory service in the Gulf States resigned (13 March 1811) his commission of first lieutenant in the army. He joined Magee's Mexican forces which were besieged at Fort Bahia (14 Nov. 1812) by the Spanish royalists. On Magee's death, Noah in command of the rear-guard routed the enemy and captured San Antonio. War having been declared by the United States against England, Noah left Texas to re-enter the United States army, but on President Madison's refusal to recommission him, volunteered as a private soldier to defend Brooklyn and served to the end of the war. At the time of his death he was the oldest graduate from West Point. Consult Cullom, 'Biographical Sketches of Deceased Graduates of the United States Military Academy.'

NOAH, Book of, a legendary pseudographical book purporting to throw fuller light on the antediluvian and postdiluvian years of Old Testament history. The book has been lost but its contents have been largely incorporated in the Ethiopic book of Enoch and in the book of Jubilees. Its date and authorship are uncertain; a recent commentator places the former as between B.C. 50 and A.D. 80.

NOAILLES, nō-i, French family originating in Limousin, dating from the 11th century. Its more important members are as follows: **ANTOINE DE NOAILLES**, b. 1504; d. Bordeaux, 11 March 1562. He was admiral of France, Ambassador to England 1553-56, the king's agent in the Truce of Vaucelles and governor of Bordeaux. His great-grandson, **ANNE JULES DE NOAILLES**, b. Paris 1650; d. Versailles 1708; was a servile courtier of the French king, who made him marshal of France in 1693. His son, **ADRIEN MAURICE, DUC DE NOAILLES**, b. Paris, 29 Sept. 1678; d. there, 24 June 1766, like his father was marshal of France (1734). Before this he had made his reputation by his financial policy and his opposition to Law. He fought in the war of the Polish Succession, became commander-in-chief of the army in Italy in 1735 and in the war of Austrian Succession was crushingly defeated at Dettingen. His memoirs were edited by Millot (1777) and his correspondence by Rousset (1865). His son, **LOUIS**, b. Versailles, 21 April 1713; d. Paris, 22 Aug. 1793; fought in Flanders and Germany; became marshal of France in 1775. **LOUIS MARIE, VICOMTE DE NOAILLES**, b. Paris, 1756; d. Havana 1804; married a sister of Lafayette's wife and with Lafayette urged French intervention, and fought in America in behalf of the American colonies, in which he took refuge during the darkest days of the Revolution. He returned to France soon afterward, but resigned from the army in 1792, again came to America and fought bravely in the French army in San Domingo, being killed in the brilliant

capture of an English war vessel off Havana. **PAUL**, a great-grandson of Louis, b. Paris, 4 Jan. 1802; d. there, 12 May 1885; upheld the Bourbons and wrote 'Histoire de Mme. de Maintenon' (1848-58) and 'Histoire de la Maison de St. Cyr' (1865), and was a member of the Academy. His great-grandson, in turn, **EMANUEL HENRI, MARQUIS DE NOAILLES**, b. 15 Sept. 1830; d. 16 Feb. 1909; was French Minister to Washington 1872, to the Papal Curia 1873, to Rome 1876-82, to Constantinople 1882-96, and 1896-1902 to Berlin; and wrote on Polish history. His elder brother, **JULES CHARLES VICTURNIEN, DUC DE NOAILLES** (1826-95), was a well-known economist, one of the editors of the *Revue des Deux Mondes* and author of many economic and historical studies. The **COMTESSE NATHIEU DE NOAILLES** (b. 1876), who is of Roumanian descent, was married in 1897 to the grandson of the last-mentioned Duke, and is a novelist and poet of the ultra-emotional school. Her novels include 'La nouvelle espérance' (1903); 'Le visage émerveillé' (1904); 'La domination' (1905); and her poetical works, 'Le cœur in nombrable' (1901, crowned by the French Academy); 'Les éblouissements' (1907); 'Les vivants et les morts' (1913).

NOATAK (nō'ā-tāk') **RIVER**, Alaska, a large river flowing into Kotzebue Sound, with a drainage basin of 8,000 square miles. In 1885-86 it was explored and navigated for 100 miles by McLenegan and Story. As it lies within the Arctic Circle its extensive mineral deposits—coal, copper, silver and gold—are difficult to develop. Fifty miles north of Kotzebue is Noatak, a mission for the Eskimo. Consult 'United States Geological Survey,' Bulletin No. 536.

NOBBE, nō'bē, **Friedrich**, German plant physiologist: b. Bremen, Germany, 20 June 1830. He was educated at Jena and Berlin, and in 1861 was called to a professorship at the Industrial School in Chemnitz. In 1868 he joined the faculty at the Academy of Forestry and Agriculture at Tharandt, where he founded an experiment station for plant physiology, and he originated, in 1869, scientific seed testing. He has published 'Wider den Handel mit Waldgrassamen für die Wiesenkultur (1876); 'Anträge des Ausschusses für Samenprüfungen' (1900); 'Bericht des Ausschusses für Samenprüfungen' (1903-04), etc.

NOBEL, nō'bēl, **Alfred Bernard**: b. Stockholm, Sweden, 21 Oct. 1833; d. San Remo, Italy, 10 Dec. 1896. He was the third son of Emmanuel, and in 1842 his father moved with his family to Saint Petersburg, Russia. In 1850 he sent Alfred to the United States to study under the famous engineer, John Ericsson. On reaching his 21st year the son returned to Saint Petersburg trained as an engineer and moreover able to speak fluently Swedish, Russian, English, German and French. Later he took up the study of chemistry and showed a marked preference for that science in its technical applications. Emmanuel Nobel went to Russia under contract to prepare mines and torpedoes for the Russian government, and erected on the Neva works for their manufacture which eventually were extended to include the manufacture of firearms and agricultural implements.

After Alfred returned from America he was constantly engaged with his father in pursuing some invention. Among other substances nitroglycerin especially occupied their attention, and finally in 1862 they had erected a works at Hølenborg, Sweden, where nitroglycerin was manufactured on a commercial scale for the first time in its history. In 1864 the works were destroyed by an explosion which killed the chemist and Alfred's younger brother Oscar, and the calamity so affected Emmanuel Nobel as to bring on a paralytic stroke which left him permanently crippled. Alfred Nobel, however, immediately erected new works on a barge anchored in Lake Mälaren and in 1865 enlisted capital to erect works on a large scale at Winterviken, Sweden, and Krümmel, Germany. So many accidents occurred with nitroglycerin, and especially the destruction of a vessel transporting it at Aspinwall on the Isthmus of Panama attracted such attention, that its transportation was interdicted by many governments. In the latter part of 1866 Nobel discovered dynamite, which replaced it and which was at once manufactured in his Swedish and German factories and in 1868 at a factory which he started near San Francisco, Cal. In 1871 he erected at Ardeer, Scotland, the works which soon became the largest dynamite works in the world. In fact dynamite proved to be of such utility that works sprang up in all civilized countries. In 1875 Nobel invented explosive gelatine and the gelatine dynamites. In 1888 he invented ballistite. Alfred Nobel was interested in many other arts than that of explosives, having taken out in England alone 129 patents. With his brothers Ludwig and Robert he formed in 1878 the famous firm of Nobel Brothers that operated the petroleum wells at Baku, Russia, and became the most active competitor of the Standard Oil Company. He also purchased the large ordnance works at Bofors, Sweden, that he might the more readily carry out his inventions in ordnance and his investigations in metallurgy. At his death he left an estate worth over nine millions of dollars, and in his will, after leaving small legacies to his already wealthy relatives, directed that the residue should constitute a fund the interest from which should be divided into five equal amounts and awarded as prizes to the person who shall have made, (1) the most important discovery or invention in the domain of physics; (2) in chemistry; (3) in physiology or medicine; (4) who shall have produced in the field of literature the most distinguished work of an idealistic tendency; and (5) who shall have most or best promoted the fraternity of nations, the abolishment or diminution of standing armies and the formation and increase of peace congresses. See NOBEL PRIZES.

CHARLES E. MUNROE.

NOBEL PRIZES, The. A series of five annual prizes provided for by the will of Alfred Bernard Nobel (q.v.), intended for the reward of individuals who work for the benefit of humankind in the domains of (1) physics, (2) chemistry (3) medicine, (4) literature and (5) peace. Prizes (1) and (2) are awarded by the Royal Academy of Science in Stockholm; (3) by the Caroline Medical-Chirurgical Institute in Stockholm; (4) by the Swedish Academy in

Stockholm, and (5) by the Norwegian Storting (Parliament). The statutes approved by King Oscar of Sweden require among other conditions "that every candidate for a prize . . . be proposed as such in writing by some duly qualified person. A direct application for a prize will not be taken into consideration." "Every written work, to qualify for a prize, shall have appeared in print." "No work shall have a prize awarded to it unless it has been proved by the test of experience or by the examination of experts to possess the pre-eminent excellence that is manifestly signified by the terms of the will." The announcements of the awards are made on 10 December when the prize is given together with a diploma and gold medal. It is expected that within six months thereafter the prize-winner will lecture upon the subject for which the prize is awarded at Stockholm, or, in the case of the Peace prize, at Christiania.

The will was contested by heirs but a compromise was effected on condition that a portion of the property be devoted to the founding of institutions for research, known as Nobel Institutes, which has been done. The income from the residue of the estate permits, however, of five prizes, each approximating closely to \$50,000 in value, reduced after 1915 by the amount of the Swedish defense tax, being awarded annually.

From their inception in 1901 to 1920 the awards have been as follows:

Physics.—W. C. Röntgen, German; H. A. Lorentz and P. Zeeman, Hollanders; H. A. Becquerel, P. Curie and Marie S. Curie, all French; Lord Rayleigh, English; Philipp Leonard, German; J. J. Thomson, English; Albert A. Michelson, American; Gabriel Lippman, French; William Marconi, Italian, and Ferdinand Braun, German; Johannes Diederik van der Waals, Hollander; Wilhelm Wien, German; Gustaf Dalen, Swiss; H. Kamerlingh Omnes, German; M. von Laue, German; William Henry Bragg and W. L. Bragg, English; Charles G. Barkla, English; M. Planck and Professor Stark, Germans; C. G. Breteuil, French.

Chemistry.—J. H. von Hoff, Hollander; E. Fischer, German; S. A. Arrhenius, Swede; Sir William Ramsay, English; Adolph von Boeyer, German; Henri Moissan, French; Edouard Buchner, German; Sir William Crookes, English; Ernest Rutherford, English; Wilhelm Ostwald, German; Otto Wallach, German; Marie S. Curie, French; Professor Grignard and Professor Sabatier, French; Professor Werner, Swiss; William Richards, American; Richard Willstätter, F. Haber, Germans, and Professor Asihon, Finnish.

Medicine.—E. A. von Behring, German; R. Ross, English; N. R. Finsen, Dane; Pavloff, Russian; Robert Koch, German; Ramon y Cajal, Spanish; Professor Golgi, French; Dr. Laveran, French; Paul Ehrlich, German, and Elie Metchnikoff, Russian; Theodor Kocher, Swiss; Albrecht Kossel, German; Aliyar Gullstrand, Swedish; Alexis Carrel, French; Charles Richet, French; R. Barany, Austrian; Jules Bordet, Belgian, and A. Krogh, Danish.

Literature.—R. F. A. Sully-Prudhomme, French; Th. Mommsen, German; Björnsterne Björnson, Norwegian; Frederic Mistral,

French, and José Echegaray, Spanish; Henryk Sienkiewicz, Polish; Professor Carducci, Italian; Rudyard Kipling, English; Rudolf Eucken, German; Selma Lagerlöf, Swedish; Paul Heyse, German; Maurice Maeterlinck, Belgian; Gerhard Hauptmann, German; Rabindranath Tagore, Bengalese; Romain Rolland, French; V. Heidenstams, Swedish; K. Gjellerup, Dane; H. Pontoppidan, Dane; C. Spitteler, Swiss; K. Hamsun, Norwegian.

Peace.—Henri Dunant, Swiss, and Fr. Passy, French; E. Ducommun and A. Gobat, both Swiss; W. R. Cremer, English; the Institution of International Law (first award to an institution); Baroness von Suttner, Austrian; Theodore Roosevelt, American; E. T. Moneta, Italian, and Louis Renault, French; K. P. Arnoldson, Swede, and M. F. Bajer, Dane; Baron d'Estournelles de Constant, French, and M. Beernaert, Belgian; International Permanent Peace Bureau, Berne; T. M. C. Asser, Hollander, and Alfred Fried, Austrian; Elihu Root, American; Henri la Fontaine, Belgian; International Red Cross of Geneva; Woodrow Wilson, American.

In 1918 Theodore Roosevelt, with the consent of Congress, distributed his prize among war charities. Consult Mosenthal, 'The Inventor of Dynamite' in the *Nineteenth Century* (1898); 'Les Prix Nobel' published annually at Stockholm.

NOBERT'S TEST-PLATES, finely-ruled glass plates so named from F. Nobert, a German optician, used for testing the power of microscopes. The rulings are executed on the under surface of a piece of exceedingly thin glass by means of a diamond point. Some of these ruled plates have the almost incredible number of 225,187 spaces to the inch. As means of testing the power of the microscope they are superior to any other object.

NOBILITY, in European countries, a certain rank or class of society which possesses hereditary honors and privileges above the rest of the citizens. Such a class is found in the infancy of almost every European nation. Its origin may be attributed to military supremacy, to the honors paid to superior ability, or to the guardians or royal rulers of the nation. Among the Romans the patricians originally formed the nobility; but a new order of nobility arose out of the plebeians, consisting of those who had held curule magistracies and their descendants, and enjoying the right of having images of their distinguished ancestors. Among the ancient German tribes only obscure traces of hereditary nobility are found. The dignities of the counts of the Franks, the aldermen and great *thanes* of England, as also of the *jarls* (in England *eorlas*) of Denmark, were accessible to every one distinguished by merit and favored by fortune. In Venice a civic nobility grew up consisting of a series of families who gradually acquired all political power and kept it to themselves and their descendants. In England hereditary nobility, the nobility belonging to the titles of duke, marquis, earl, viscount and baron, is now entirely personal, though formerly, as a result of the Norman conquest, it was connected with the holding of lands.

In Spain and Italy still the same rank depends in greater measure upon property; and in France and Germany the *de* and *von* of titles point to the same fact. The higher grade of nobility in Spain are called *Grandees*, the lesser *Titulados*. In France and Germany nobility is common to all the members of the noble family, the nobles long formed a class of petty sovereigns within their own domains, and they could not engage in trade without losing their rank. The French Revolution first deprived the nobles of that country of their privileges and exclusive rights, as that of jurisdiction, etc.; and the decree of 19 June 1790 abolished hereditary rank entirely. Under Napoleon I arose a new hereditary nobility, with the titles of princes, dukes, counts, barons and chevaliers, which descended to the eldest son. After the restoration of the Bourbons (1814) the ancient nobility reclaimed their former rights and privileges. Nobility was again abolished in 1848, but was restored by Napoleon III. All marquises and viscounts hold pre-Revolution titles. In Germany there are three distinct grades of nobility: (1) The members of former reigning houses, and descendants of families who belonged at the time of the old empire to the sovereign nobility of the state, and were *reichsunmittelbar*, or directly connected with the empire, or holding their domains directly under the emperor, but whose houses were subsequently mediatised, or deprived of sovereign power in accord with special treaties between the state and the princes. There are at present 50 princely and 51 gräflliche (countly) mediatised families, who in accordance with the act of the diet of 1806 had equality of rank with the reigning houses and enjoyed many of the special privileges which were accorded to the high nobles of the empire. (2) Counts and barons not belonging to the reigning or mediatised houses; and (3) the knights and patrimonial proprietors of Germany. Under the new German constitution titles are recognized only as part of a name and may not be conferred any longer. In Norway the Parliament abolished nobility by the three successive decrees of 1815, 1818 and 1821. In Great Britain titles of nobility can only be conferred by the sovereign, and that by patent in virtue of which they become hereditary. The nobility, as the term is commonly used, consists of those holding the titles already mentioned (or all above the rank of baronet) and their more immediate connections; but if the term were to be used as generally in Europe the gentry would also be included, or all families entitled to bear coat armor. Those of the nobility who are peers of England or of the United Kingdom, hold hereditarily a seat in the House of Lords, while the Scottish peers elect 16 of their number to represent their order, and the Irish peers elect 28 representatives for the same purpose. A few peerages are held by Canadians; creations of recent years have evoked a storm of protest in the Dominion. There is no nobility in the United States, the Federal Constitution declaring that "No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of Congress, accept of any present, emolument, office or title of any kind whatever, from any king, prince or foreign state." Con-

gress sparingly gives its consent for a person in the service of the government to accept a decoration or other mark of honor from another government.

P., 'Noble and Gentle Men' (ib. 1860). *France*: Cousin, Henri, 'Des noms des noblesse et des titres nobiliaires spécialement depuis la Révolution' (Dijon); Guilhaumez, 'Essai sur l'origine de la noblesse en France au moyen âge' (Paris 1902); Langlois, 'Les origines de la noblesse en France' (ib. 1902); de Toqueville, 'L'Amien Régime et la Révolution' (ib. 1856). *Germany and Austria*: Strantz, 'Geschichte des deutschen Adels' (1851); Rose, 'Der Adel Deutschlands und seine Stellung im deutschen Reich' (Berlin 1883). *Italy*: Litta, 'Celebri famiglie italiane' (1819-1907); *Spain*: Bethancourt, 'Historia genealógica' (Madrid 1897-1907).

NOBLE, Alfred, American civil engineer: b. Livonia, Mich., 7 Aug. 1844; d. 19 April 1914. From 1862 to 1865 he served with the Union forces in the Army of the Potomac; after the war entered the University of Michigan, where he was graduated in 1870. In 1870-82 he superintended alterations and improvements in the Saint Mary's Falls Canal and the Saint Mary's River between lakes Huron and Superior. After 1882 he gave his time to bridge and tunnel engineering. He was engineer of the Washington Bridge, New York, the Mississippi bridges at Alton and Cairo, Ill., and was assistant chief engineer of the Missouri River bridges at Leavenworth and West Alton. He was a member of the Nicaragua Canal Board in 1895, of the United States Board of Engineers on deep waterways in 1897-1900 and of the Isthmian Canal Commission in 1899-1903. As member of the International Board of Consulting Engineers on the Panama Canal, Noble was one of the minority of five out of 13 engineers who advocated a lock system instead of a sea-level canal. From 1902 to 1909 he was chief engineer of the Pennsylvania Railroad tunnels under the East River, and of the terminal construction of the same road in New York City. He served also in an advisory capacity in the construction of the New York Subways and the Galveston sea-wall. He was awarded the John Fritz medal in 1910 and the Cresson medal of the Franklin Institute in 1912. He was a member of the American Society of Civil Engineers and of many similar societies, and served terms as president of most of these. He wrote papers which appeared in the 'Proceedings' of these societies.

NOBLE, Sir Andrew, English physicist: b. Scotland, 13 Sept. 1832; d. 1913. He was educated at Edinburgh Academy and the Woolwich Military Academy and was an authority on army ordnance and explosives. He was assistant inspector of artillery in 1859, and after 1860 was a member of the firm of Sir W. G. Armstrong, Whitworth and Company. In 1862 he invented the chronoscope, by which it was possible to measure the velocity of a projectile by various powders. This invention hastened the adoption of rifles. Later he became chairman of the company. In 1900 he served as

member of a Royal Committee to investigate the properties of smokeless powder. He received many honors from domestic and foreign scientific societies and honorary degrees from Oxford and Cambridge. He was made Knight Companion of the Bath in 1893 and was created a baronet in 1902. He published 'Artillery and Explosives' (1906) and many papers, lectures, etc. He became high sheriff of Northumberland in 1896.

NOBLE, Annette Lucile, American author: b. Albion, N. Y., 12 July 1844. She was graduated at Phipps Union Seminary in 1863, and devoted herself to literature and traveled over most of the civilized world writing stories and travel sketches for American periodicals. She wrote 30 books for boys and girls, some of which have been translated into Dutch, German and other languages. Her most popular works are 'Uncle Jack's Executors' (1880); 'After the Failure' (1887); 'The Crazy Angel' (1901).

NOBLE, Eugene Allen, American educator: b. Brooklyn, N. Y., 5 March 1865, was graduated from the Wesleyan University, (Connecticut) in 1891 and studied theology also at Garrett Biblical Institute in Illinois. He was ordained to the Methodist Episcopal ministry and became pastor of Methodist Episcopal churches in Bridgeport, Conn. (1891-95) and Brooklyn (1895-97). From 1897 to 1902 he was superintendent of the Seney Hospital, Brooklyn, and from 1902 to 1908 head master of the Centenary Collegiate Institute at Hackettstown, N. J. In 1908 he became president of Goucher College, Baltimore, serving until 1911 when he became president of Dickinson College (Pennsylvania), which post he held until 1914. He subsequently resided in Schenectady, N. Y., and is a contributor to magazines on educational and literary topics. He has received the degree of LL.D. from Hamilton College and the University of Pittsburgh; S.T.D. from Wesleyan University; L.H.D. from Dickinson College; and D.D. from Saint John's College, Maryland.

NOBLE, Frederick Alphonso, American Congregational clergyman: b. Baldwin, Maine, 17 March 1832; d. 31 Dec. 1917. He was graduated from Yale in 1858, and from the theological seminaries of Andover (1858-60) and Lane (1861). He was minister of Union Park Church, Chicago, 1879-1901, when he resigned and was president of the American Missionary Association 1898-1900. He has been prominently connected with the leading missionary conferences of his church, and has written 'Divine Life in Man' (1896); 'Typical New Testament Conversions' (1901); 'The Pilgrims' (1903), etc.

NOBLE, John Willock, American lawyer: b. Lancaster, Ohio, 26 Oct. 1831; d. 1912. He was graduated from Yale University in 1851 and engaged in law practice. He was city attorney of Keokuk, Iowa, at the outbreak of the Civil War, when he enlisted and served through the war, rising to the rank of brevet brigadier-general. After the war he settled in Saint Louis; in 1867-70 he was United States attorney for Missouri at Saint Louis, and in 1889-93 Secretary of the Interior in President Harrison's Cabinet. He resumed his law practice in Saint

Louis. His term as Secretary was rendered difficult by the questions attendant on organizing the Territory of Oklahoma and opening Indian lands to settlement by the whites.

NOBLE, in *numismatics*, an ancient English gold coin, six shillings and eightpence, or \$1.66, first struck in the reign of Edward III, 1344. Half-nobles and quarter-nobles were also in circulation at the same period.

NOBLESVILLE, no'b'lz-vil, Ind., city, county-seat of Hamilton County, on the White River, and on the Lake Erie and Western and Chicago and Southeastern railways, 24 miles north by east of Indianapolis, and interurban roads to all parts of Indiana. It is in a fine agricultural region and in a natural gas belt. It was settled in 1824, and in 1839 was incorporated. Hamilton County is the greatest horse-raising county in Indiana. Its manufacturing industries comprise carriage, furniture and box factories, planing mills, flouring mill, foundry, straw board, enameling, carbon, serum, and dairy products, and a canning factory. It has grain elevators, water, electric and gas plants, splendid schools, churches, library, up-to-date public buildings, paved streets, concrete walks, modern homes with beautiful lawns and shade trees. Living conditions and other advantages are most favorable for all kinds of manufacturing. It has a large trade in its manufactured articles and farm products at home and abroad. It maintains a very progressive Chamber of Commerce. The charter of 1890 provides for a mayor, who holds office four years, and a council. Pop. (1920) 4,758.

NOBUNAGA, nō-boo-nā'gā, Japanese general and statesman: b. Owari, 1533; d. Kioto, 1582. He was son of a soldier and small landholder, and to the little property left him in 1549 by his father rapidly added more, so that in 1559 he had control of the entire province of Owari. Thence, with the assistance of his lieutenant, Hideyoshi, he made bold forays into neighboring provinces. In 1567 he made an alliance with Yoshiaki, younger brother of the lately assassinated shogun, and, having put him upon the throne in 1568, was appointed vice-shogun, in which office he put down all opposition, crushed the political power of Buddhism, and encouraged the Jesuit missions, no doubt merely to counteract the influence of the Buddhists. Yoshiaki, attempting an alliance against Nobunaga, was deposed in 1573, and Nobunaga took the powers but not the titles of the shogunate, thus forwarding the work of political reform. In 1582 one of his lieutenants, angered, according to legend, by a practical joke of Nobunaga, turned against him, hemmed him in in a temple in Kioto, and set fire to the building. Nobunaga committed hari-kari. Consult Denning, 'Life of Hideyoshi'. (1890); Brinkley, 'Japan' (1901).

NOCERA INFERIORE, nō-chā'ra ěn'fā-rē-ō'rā (formerly **NOCERA DE' PAGANI**), Italy, town in the province of Salerno, 23 miles southeast of Naples by rail. It is situated at the foot of Monte Albino, 135 feet above the sea-level. A branch railway of the line from Naples to Avellino connects Nocera with Codola (three miles). The town was the ancient Nuceria Alfaterna, destroyed by Hannibal in 216 B.C. and rebuilt by Augustus. The old

cathedral proves that Nocera became a see at an early date. In the 12th century Nocera took the part of Innocent II against Roger of Sicily and paid heavily for its choice. A colony of Saracens was brought here by Frederick II, and from their presence the town is supposed to have received the name "of the pagans," a name also given to the town of Pagani about a mile away. In 1385 Pope Urban VI was besieged in the castle of Charles of Durazzo. Here he had imprisoned the cardinals who favored the anti-pope Clement VII. In this old castle, now in ruins, Helena, widow of Manfred died after the battle of Benevento (1266). Two miles toward the village of Nocera Superiore is the circular church of Santa Maria Maggiore dating from the 4th century with its curious dome covered with a false roof. This is supported by 40 ancient columns and its walls are covered with frescoes of the 14th century. Nocera was the birthplace of Francesco Solimena, the painter, and of Hugo de' Pagani, founder of the Templars. Nocera is the episcopal see of Campania. It has several large factories for linen and woolen goods. Pop. (1911) 23,368.

NOCTES AMBROSIANÆ, The. It was in October 1817, that the brilliant young Scotchmen, John Wilson and John Gibson Lockhart, took the new *Blackwood's Magazine* out of the hands of two incompetents who for six months had been feebly trying to bring it to birth, and made it at once the most brilliant and daring of English periodicals. Five years later, in 1822, there appeared in its pages the first number of that famous series of papers in dialogue, the 'Noctes Ambrosianæ.' It is not certainly known with whom the plan of the Noctes originated. For the first year or more, both Wilson and Lockhart seem to have contributed to them, perhaps with some assistance from that swash-buckling Irishman, William Maginn, who figures as O'Doherty in the early numbers. But in 1825 Lockhart resigned his position on the *Blackwood* to take charge of the new *Quarterly Review* in London, and after that time most of the papers were certainly written by Wilson himself. He abandoned the attempt to impersonate many different characters, and reduced the number of speakers to three: Christopher North, the Ettrick Shepherd (James Hogg), and a Mr. Tickler, said to represent an uncle of Wilson. But the three persons only represent different sides of Wilson's genius or different moods of his temper. Christopher North is Wilson as critic or philosopher, though not given to very staid reflection in either capacity; the Shepherd represents Wilson's exuberant humor and extravagant sentiment—Wilson letting himself go; Tickler, the most prosaic person of the three, is Wilson the man of affairs. The Noctes are the record of those jovial nights when these three foregathered in "the blue room" or at the well-laden table of the Edinburgh inn of Mr. Ambrose.

No form of composition could have been better suited to give full expression to Wilson's genius. For Wilson was never a careful or consecutive thinker; his prejudices and his emotions were always getting the better of his argument. His statements were seldom precise, his opinions seldom temperate. But from the

jovial speakers at the table of Mr. Ambrose we do not expect methodical discussion in judicial phrase. It is talk we hear there; the talk of red-blooded men of full minds and healthy digestions, eager, witty, exhaustless and never dull. It ranges freely over all subjects, literary, social, political: in one evening you shall get a broad and vivid picture of the life of that day as a high-spirited Tory gentleman sees it. Of course the reader of our time must find much of this rapid after-dinner talk concerned with matters merely local and temporary, with men and measures now forgotten; he will sometimes also be a little impatient at the amount of interest in meats and drinks and the effects thereof. Yet in these papers from month to month there is a great volume of literary criticism, often prejudiced, usually brief and unsystematic, but often wise and never merely idle; there is also a great body of political and social criticism, often narrowly Tory in character, but always positive and vigorous. And the talk is constantly running away from these more serious themes, to some of the homely joys of active life. You shall find an account of a dog-fight or a swimming match standing cheek by jowl with a slashing criticism of the cockney poets or an estimate of the Kantian philosophy. For North was always an out-of-door man who loved horses and dogs; perhaps he is at his very best in some of those rhapsodies of the Shepherd which are at once the most faithful and the most imaginative descriptions of Scottish scenery ever written.

But whoever the speaker and whatever the theme, the voice is always that of John Wilson — big, arrogant, sentimental, soft-hearted giant, who duffed the years aside and declared that the one thing he proposed never to learn was how to grow old. The voice is doubtless rather loud and the temper over-excited. There was little subtlety in Wilson's mental processes, little fineness or delicacy in his sympathies. But, perhaps for this reason, no man could ever put himself more completely into his writing. To be in his company is, at all events, to get a new sense of many of the healthy joys of living. Even if it is claimed that the Noctes do not teach or inspire, they have at least lasting power to exhilarate; and that, in such a dull-colored world as this sometimes seems to be, is no small service. Consult Oliphant, Mrs., 'William Blackwood and His Sons' (Vol. I, ch. 6); Saintsbury, 'Essays in English Literature' (1780-1860, ch. 9); Winchester, C. T., 'A Group of English Essayists.'

CALEB T. WINCHESTER,

Late Professor in Wesleyan University.

NOCTILUCA, a luminous flagellate protozoan (*Noctiluca miliaris*), extremely abundant throughout all seas, and one of the chief causes of the "phosphorescence" of the waves. It is a spherical animal — large for an infusorian (.02 inch in diameter) — and moves by means of a long stout lash or flagellum, beside which there is a second, very much smaller, lying in the "mouth" region. Its substance is remarkably spongy, and the phosphorescence is said by Allman to have its seat just underneath the tough rind which is its most peculiar characteristic. The young are derived from segmentation of the protoplasm of the body, which forms small oval bodies with a whip-like lash, quite unlike the adult, but in general resembling other flagel-

late protozoa. It represents, with a similar form (*Leptodiscus*), the order *Cystoflagellata*. See FLAGELLATA.

NOCTUIDÆ. See MOTHS.

NOCTURNE, (1) in art, a painting exhibiting some of the characteristic effects of night light. Whistler has produced various nocturnes which have given rise to considerable controversy. (2) In music, the term denotes a composition in which the emotions, particularly those of love and dreamy, melting tenderness, are developed. The nocturne was invented by John Field, and has become a favorite style of composition with modern pianoforte composers. Chopin is the most famous of nocturne composers. See CHOPIN.

NOD, LAND OF, The, the "land east of Eden," to which Cain fled after he had killed his brother Abel (Genesis iv, 16). Some authorities consider the word as coming from the Hebrew *nûd*, to flee, and think the Land of Nod means simply the land of flight, or exile, or "the land of wandering." Other authorities go so far as to identify Nod with some country in India, or take it to mean the land of nomadic tribes in Asia, perhaps extending even to China. Sayce (*Expository Times* 1911) thinks it was the "land of Yalu," east of Babylonia. Others again suppose that Cain represents the Kenites, a tribe inhabiting the Negeb, and that the Land of Nod may have been a district there. Cain, or Kayin, might easily have represented the nomads of Central Asia. "That the figure of Cain represents some phase of nomadic life may be regarded as certain," writes a commentator. The name Cain has a collective sense; and every descriptive touch in the closing verses is characteristic of desert life. His expulsion expresses the fundamental fact that his descendants are doomed to wander in the uncultivated regions beyond the pale of civilization. We are, therefore, led to think of Cain as the impersonation of an inferior race of nomads, maintaining a miserable existence by the chase and practising a peculiarly ferocious form of blood-feud. The view thus suggested of the fate of Cain finds a partial illustration in a group of low-caste tribes called Solubba, or Sleyb. These people live partly by hunting, partly by coarse smithwork and other gipsy labor in the Arab encampments. They are forbidden by their patriarch to be cattle-keepers, and have no property but a few asses; they are excluded from fellowship and intermarriage with the regular Bedouin, though on friendly terms with them; and they are the only tribes that are free of the Arabian deserts to travel where they will, ranging practically over the whole peninsula from Syria to Yemen. To go to the Land of Nod is an old English form meaning to go to bed.

NODAL LINES AND POINTS. See NODE; HARMONICS.

NODDY, a sooty brown tern (*Anous stolidus*), widely diffused through the northern and southern hemispheres, and well known to sailors for its fearlessness, regarded as stupidity, allowing itself even to be taken by the hand; but this is true only of birds rarely or never disturbed by men. The noddy is a rare visitant to northern shores, but is very abundant in warmer climates, as in the West Indies and South Seas,

where its eggs are gathered from certain lonely islets in immense quantities and used as food.

NODE, (1) *in astronomy*, the two points in which the orbit of a planet intersects the plane of the ecliptic; the one through which the planet passes from the south to the north side of the ecliptic being called the ascending node, and the other the descending node. As all the bodies of the solar system, whether planets or comets, move in orbits variously inclined to the ecliptic, the orbit of each possesses two nodes, and a straight line drawn joining these two points is called the line of nodes of each body. It is scarcely necessary to add that as the earth moves in the plane of the ecliptic she has no nodes. The places of the nodes are not fixed points on the plane of the ecliptic, but are in a constant state of fluctuation, sometimes advancing (eastward), and at other times receding (moving westward). This motion is produced by the mutual attractions of the planets, which tend to draw each of them out of the plane of its orbit; and it depends upon the relative positions of the planets with respect to another planet whether that planet's nodes shall advance or recede. (2) *In physics*, a point in a vibrating body, or system of vibrating particles, where there is no movement. When a body is vibrating, the vibratory motion is conveyed from one place to another by the action of the molecular forces of the particles on one another. If a plate of glass or metal be held in the hand, and a bow be drawn across the edge, particles of fine sand, previously placed on the plate, will arrange themselves in lines, along which it is evident no vibration has taken place. These lines, called nodal lines, generally form geometrical figures. (3) *In botany*, the joint of a stem, or the part where a leaf or several leaves are inserted.

NODIAK, a Papuan animal. See ECHIDNA.

NODIER, Charles, shärl nō-dē-ä, French author: b. Besançon, France, 29 April 1780; d. Paris, 27 Jan. 1844. At an early age he proceeded to Strassburg, where he studied under Eulogius Schneider, and, returning to his native district, gave much of his attention to natural history. In 1798 he became assistant librarian at Besançon. Soon drawn into connection with Royalist clubs, he wrote with great acrimony against Bonaparte. These philippics subjected him to prosecutions, and even to imprisonment. For several years he lived concealed in the Jura, and then fled to Switzerland, where he supported himself as a corrector of the press until, after many adventures, he returned to France. In 1814 he went to Paris, where Louis XVIII rewarded him with a title of nobility and the cross of the Legion of Honor. In 1824 he was appointed librarian to the arsenal, and while in that post he actively assisted the growth of Romanticism, and in 1833 was admitted a member of the Academy. As a critic he is known by a series of excellent editions of the French classics with notes. As a grammarian and lexicographer he published 'Dictionnaire universel de la langue française' and 'Elements de linguistique.' Among his many other works, many of them fictions of the romantic school, are 'Stella ou les proscriptions' (1802); 'Trilby' (1822); the first direct imitation in France of Scott's romances; 'La Fée aux miettes' (1832);

'Légende de Sœur Béatrix' (1838). Consult Menessier-Nodier, 'Charles Nodier' (1867).

NODULAR DISEASE. See SHEEP.

NOË, Amédée de, ä-mä-dä dē nō-ä. See CHAM.

NOEGGERATH, nêg'-rät, Emil Jacob, German gynecologist: b. Bonn in 1827; d. Wiesbaden in 1895. He was educated in Bonn, receiving his medical degree in 1855, and came to the United States in 1856. Settling in New York, he became professor of obstetrics and gynecology at the Bellevue Hospital Medical College. In 1885 he went back to Germany and settled in Wiesbaden. He originated a new method in ovariectomy and was one of the first to emphasize the importance of latent gonorrhea in women. With Dr. Jacobi he founded in New York the *American Journal of Obstetrics*, of which he was coeditor from 1868 to 1871. With Abraham Jacobi he also wrote 'Contributions to Midwifery' (1859). He was sole author of 'Beiträge zur Struktur und Entwicklung des Carcinoms' (1892).

NOEL, nō'ë, Baptist Wriothsley, English clergyman: b. Leightmont, Scotland, 10 July 1799; d. Stanmore, Middlesex, 20 Jan. 1873. A brother of the 1st earl of Gainsborough, he was graduated from Cambridge University in 1821, entered the Anglican priesthood and became in 1827 incumbent of Saint John's, Bedford Row, London, where he achieved distinction as an evangelical preacher and helped (1846) to found the Evangelical Alliance. In 1848 he quitted the Establishment for the Baptist fold, was minister of John Street Chapel, London, 1849-68, was twice president of the Baptist Union, and was prominent in philanthropic labors in the metropolis. He supported strenuously the cause of the North in the American Civil War. He published 'Essay on Christian Baptism' (1849); 'The Union of Church and State' (1848); 'Freedom and Slavery in the United States of America' (1863); 'Hymns About Jesus' (1869), etc.

NOEL, Nicholas, French physician: b. Rheims, 27 March 1746; d. Rheims, 11 May 1832. He was the son of a poor laborer and was apprenticed to a blacksmith, but his love for science attracted the curé of the parish, who obtained a fellowship for him in the Paris University. He left his studies there to give his assistance to the United States in the struggle for independence. Arriving in 1776 he offered his services to Congress and was appointed surgeon to a regiment in Gen. Nathaniel Green's division. He was also surgeon on the frigate *Boston*; organized the military hospitals in Philadelphia; and was present at the surrender of Yorktown in 1781. Returning to France in 1784, he became house surgeon of the hospital in Rheims. In 1792 he was again in the army. In 1793 he was appointed inspector of military hospitals in Belgium, but he resigned in 1795. He then settled in Rheims, where he founded an academy of medicine and a botanic garden. His writings include 'Journal d'un chirurgien pendant la Guerre pour l'indépendance des colonies Anglaises de l'Amérique du Nord' (Rheims 1787); 'Traité historique et pratique de l'inoculation' (1789), and 'Dissertation sur la nécessité de réunir les connaissances chirurgicales et médicales' (Paris 1804).

NOEL, Roden Berkeley Wriothesley, English poet: b. England, 27 Aug. 1834; d. Mainz, Germany, 26 May 1894. He was a son of the Earl of Gainsborough. He was educated at Cambridge, and though never a popular poet his work appeals to highly educated readers and is much of it rich in melody, though too voluminous to keep entirely to his best standard. His published volumes include 'Behind the Veil and Other Poems' (1863); 'A Little Child's Monument' (1881); 'A Modern Faust and Other Poems' (1888), etc.

NOEL, Thomas, English poet: b. Kirkby-Mallory, England, 11 May 1799; d. Brighton, 16 May 1861. He was graduated from Merton College, Oxford, in 1824, and was the author of 'The Cottage Muse' (1833); 'Rhymes and Roundelays' (1841), which includes the famous poem 'The Pauper's Drive,' often credited to Hood; 'Beatrice and Other Poems' (1868). He also wrote the words of the well-known song 'Rocked in the Cradle of the Deep.'

NOEMI, a romance by Sabine Baring-Gould, published in 1895. It is a tale of Aquitaine, during the English occupation, in the early 15th century.

NOETIANS, nō-ē'shī-anz. See SABELLIUS.

NOETIC CONSCIOUSNESS. See METAPHYSICS.

NOGALES, Ariz., town and county-seat of Santa Cruz County on Mexican border and on the Southern Pacific Railroad, 68 miles south of Tucson. A street is the dividing line from the Mexican town of the same name. The ruin of the Tumacacori Mission near Nogales, built by Father Kino in 1687, is an interesting historical feature. The town is an inland gateway to the west coast of Mexico and is a centre of mining and cattle industries. Mining machinery is manufactured. The headquarters of the United States customs district for the State are located here. The waterworks and sewage plant are municipal property. Pop. (1920) 5,199.

NOGALES, nō-gā'lēs, (1) Mexico, town in the state of Sonora, on the Santa Cruz River, on the boundary between Mexico and Arizona, and on the Sonora Railroad. A United States consul is stationed here. Pop. 3,640. (2) The Mexican town is separated only by a thoroughfare from an American town of the same name, and greater population, the capital of Santa Cruz County, Arizona.

NOGARET, nō-gā'rā', **Guillaume de**, French statesman: b. Toulouse in 1260; d. Paris, April 1313. His father was a citizen of Toulouse, said to have been condemned as a heretic during the Crusade of the Albigenses. The name came from a small ancestral property at Nogaret, near Saint Felix de Caramon. Guillaume de Nogaret studied law and was professor of jurisprudence in the University of Montpellier. In 1293 he entered the service of the French king, Philip IV, and spent the rest of his life in extending the power of that monarch. In 1295 he became a member of the royal council. His name is mainly conspicuous because connected with the quarrel of Philip IV with Pope Boniface VIII. In 1300 he was sent with an embassy to Pope Boniface VIII of

which he left a very highly colored and picturesque account; and in 1303 when Philip IV was about to yield to the power of Boniface, who was extending his authority over the sovereigns of Europe, Nogaret came forward with a bold plan that he should go to Italy, seize Boniface and bring him to a church council in France convened to depose him for heresy, simony and other crimes. The king consented to the plan, and on 7 March a solemn royal assembly was held in the Louvre, where Guillaume de Nogaret read a long series of accusations against Boniface and demanded the calling of a council to try him. Soon afterward Nogaret went to Italy, and by the aid of a Florentine spy he gathered in the Apennines a band of enemies of the Gaetani (Boniface's family). Among these was Sciarra Calanna, who accompanied Nogaret to Anagni, the birthplace of Boniface, who was there. On 7 Sept. 1303, Nogaret and Colonna at the head of a company of 1,600 men surprised the little town and took Boniface prisoner. Within two days, however, the people rose and compelled the invaders to flee. The aged Pope was freed, but he died a month later (11 October). His successor, Benedict XI, was too timid to excommunicate the offenders. Early in 1204 Nogaret went to Languedoc to report to Philip IV, who rewarded him with gifts of money and land, including the town of Marsillargues on the right bank of the Vidourle (in the eastern part of the Department of Hérault), with its castle. Nogaret was sent back with an embassy to Benedict XI to demand absolution for all concerned in the plot against Boniface. Benedict refused to receive Nogaret and excepted him from the general absolution he granted on 13 May 1304. On 7 June the Pope issued against Nogaret and those associated with him in the attack of Anagni the *Flagitiosum scelus*. When Benedict died, 7 July 1304, French influence had a Frenchman, Bertrand de Got, elected as Benedict's successor, under the name of Clement V. In 1312 Clement V acceded to Philip's plan to destroy and despoil the Templars. The whole proceeding bears traces of the unscrupulous Nogaret, who was successful in getting the renegade members of this order together to give evidence against their fellows. In 1307 Nogaret became keeper of the seal, and in consequence, was the king's chief Minister. He was employed in the trial of Guiscard, bishop of Troyes, charged with various crimes including witchcraft, which had begun in 1308 and lasted until 1313. This legal procedure may have been a gentle hint to Clement V. for the latter granted absolution to Guillaume de Nogaret on 2 April 1313. As a penance Nogaret was to go on the next crusade and also to visit certain pilgrimage places in France and Spain. He never did so. He remained keeper of the seals until his death and was busy with the king's affairs concerning Flanders a month before his death. Consult Dupuy, 'Histoire du différend d'entre le pape Boniface VIII et Philippe le Bel, roy de France' (Paris 1655); Renan in 'Histoire littéraire de la France, XXVII'; Holzmann, 'Wilhelm von Nogaret' (Freiburg 1898); Finke, Heinrich, 'Aus den Tagen Bonifaz VIII' (Münster 1902); Molinier, Auguste, 'Les Sources de l'histoire de France III' (Paris 1903), and Thomas, Louis,

'La vie privée de Guillaume de Nogaret,' *Annales du Midi* (Toulouse 1904).

NOGARET, Stanislas Henri Lucien de, French colonist in America; b. Marseilles, 1682; d. Paris, 1759. He studied law; ran away from college; served in the army in Canada until 1716, and then was sent to Louisiana, where he became Bienville's lieutenant in the bloody wars with the Natchez Indians described by Nogart in his 'Précis des établissements fondés dans la vallée du Mississippi par le Chevalier Le Moyne de Bienville' (1738). From 1735 until his death Nogaret resided in France and acted as director of the Louisiana Company.

NOGENT-SUR-MARNE, France, a town in the Department of Seine, six miles east of Paris by rail. It is built on a hill on the right bank of the Marne. The Eastern Railway crosses the Marne here over a viaduct 875 yards long. Nogent stands on the line of the Paris fortifications on the outskirts of the Bois de Vincennes. Its beautiful situation gained for the town the name of Beauté and Charles V built a castle here which Charles VII presented to Agnes Sorel who was called in consequence "Dame de Beauté." This château was demolished in the 18th century. An island in the Marne south of the town is called Ile de Beauté. An old Gothic church with a Romanesque tower is Nogent's chief building. In front of it stands a monument to the painter, Watteau, who died here in 1721. Nogent has extensive stone quarries and manufactures pottery and chemicals. Pop. (1911) 14,051.

NOGI, nōgē, Kiten Marosuke, Japanese soldier; b. Chosu, near Tokio in 1849; d. Tokio, 13 Sept. 1912. He came from one of the families of the Samurai, the old nobility of Japan, and was brought up with ideals of rigid etiquette and Spartan heroism. Trained for a soldier's career, he became a major in 1871 and was made a captain in 1877, participating in the civil war of that year in Japan. During the Chino-Japanese war he commanded a brigade and fought in the battles of Kinchow and Port Arthur, placing his troops with such skill at the latter place that the city quickly fell into the hands of the Japanese. He was immediately promoted to be lieutenant-general with command of the second division and rewarded with a peerage. In 1896 he was made governor-general of Formosa, but his rule proved too strict and he returned to Japan as commander of the 11th Division. This post he resigned in 1900 and retired to quiet life, devoting himself to farming and the study of warbooks, war maps and methods, preparing for the struggle that he predicted would come with Russia. When the Russo-Japanese war broke out in 1904, Nogi was promoted to general, and ordered to attack Port Arthur. He landed his corps on the Liaotung Peninsula on 1 June 1904 and commanded the first and 11th Divisions. Gradually he detached himself from Oku's army corps and fell into a position to march to Port Arthur. The city of Dalny fell (26 May). On 6 June Nogi took command of the Third Army, protected in the rear from the army of Oku. The Japanese had now to drive the Russians from the passes and roads and to prepare a base of supplies. Much heavy fighting occurred, but Nogi marched against

the Russian outposts on 26 June and drove the enemy from strong positions. He was, however, attacked furiously by Stoessel, the Russian commander, whom he ultimately overcame. By the end of July Nogi was in the immediate neighborhood of Port Arthur; and, although he had lost about 8,000 men, he attacked the Russians on 20 July with an equal force. His supplies were inadequate and he had not been correctly informed as to the strength of the fortress. The siege continued for six months, marked by terrific fighting and terrific losses on both sides. The Japanese lost in three weeks 16,000 men. In September the fighting concentrated at 203 Meter Hill, which the Japanese took on 5 December. Nogi's two sons were among those killed in the attempt to capture this point. The Japanese lost some 10,000 men and the Russians about 3,000 at Port Arthur which General Stoessel surrendered to Nogi on 2 January 1905. In the course of the fighting here hand grenades made their appearance. Nogi now led this army toward Mukden where General Kuropatkin had made a stand. In February Nogi swung around the Russian left wing and from 9 March to 16 March a desperate battle raged around the capital of Manchuria. The battle of Mukden was up to that date the greatest battle that the world had seen. At Mukden 700,000 troops were fighting on a line which was at one time 80 miles long. Nogi had the honor of bringing about Kuropatkin's retreat and surrender. He was created baron in 1895 and raised to count in 1906. At the command of the emperor he became honorary president of a school for young peeresses.

The unusual circumstances of his death attracted worldwide interest and comment. Japan's most famous general, with his wife, committed suicide on the occasion of the funeral of the emperor, Mutsuhito. This was done "in accordance with Samurai tradition, in order to inspire his countrymen with reverence for the past and to save them from the corrupting tendencies of modern life." As the gun gave the signal for the funeral procession to start, the Count and Countess Nogi, carefully attired for the ceremony, stabbed themselves with swords according to the etiquette of hara-kiri, the honorable Japanese suicide. The dramatic event impressed the whole world and provoked much comment. "The fact was," writes a commentator, "that General Nogi was a great Samurai bred in the practice of ancient Japanese knighthood and nobly illustrating its virtues. He had served his country with unselfish devotion. From his youth he had borne hardships and great sorrows with the stoicism of his ancestors; the winner of some of the greatest and most fiercely fought battles of modern times, he had ascribed all his victories to the influence of the spirit of his Imperial master; and when that master died, in accordance with the ancient habit of the Samurai, he committed suicide in order that the emperor might not go alone on his journey. General Nogi's death brought out very strikingly the sincerity of his loyalty to the old ideas of Bushido—the Samurai code of honor, courage, loyalty, courtesy. It also presents in a very dramatic way the contrast between non-Christian and Christian ideals."

The Japanese view of the suicide is seen in Count Okuma's words concerning the event: "There was a threefold motive: first, the deed was marked by loyalism of the very highest kind; second, the act was a warning to the modern tendencies toward corruption, or falling away from the old ideals of life among the upper classes of our people; third, it was a rebuke to those in high places in the army and in official life who are becoming more and more absorbed in money-making, in politics and in the furthering of their aspirations at Court."

Count Nogi was famous for his character as a man as well as for his soldierly qualities. He was also a famous poet, highly skilled in the technique of the art. "Poet, dreamer, seer," wrote Richard Barry, "he kept himself detached—a body apart who retained all his faculties for supreme concentration on the vital military problems when they were presented. In executive skill, in organizing talent, he seemed to be deficient. In the military genius that comprises tactics and strategy and the inspiration of effective leadership he was supreme. He died—calm, masterful, serene—with the poise of an informed spirit, to whom this life is but a lesser step in the greater journey." See *Russo-Japanese War*; Mukden; Port Arthur, etc. Consult Washburn, Stanley, 'Nogi: a man against the background of a Great War' (New York 1913); Barry, Richard, 'Nogi—Seer, Statesman and Soldier' in *Harper's Weekly* (28 Sept. 1912); Farant, Léon, 'Le général Nogi poète and also Valjoie; Jean de, 'La mentalité japonaise à propos du hara-kiri' in *Société Franco-Japonaise de Paris* (Paris 1912); Barry, Richard, 'Port Arthur: a Monster Heroism' (New York 1905), portrait of General Baron Nogi studying the defenses of Port Arthur in his garden in the Willow Tree Village, Manchuria, p. 62; also portrait of Nogi *Harper's Weekly* (21 Sept. 1912).

NOGUCHI, nō'goo-chē, Hideyo, Japanese physician: b. Inawashiro, Yama, Fukushima, Japan, 24 Nov. 1876. He was educated in public schools and under private tutors in French, English, German and Chinese literature, and was graduated in medicine at the Tokio Medical College in 1897. He was assistant in the General Hospital in Tokio in 1897-98; assistant in the Government Institute for Infectious Diseases in 1898-1900; quarantine officer in the Yokohama Harbor Station in 1899; and physician in charge of the Central Hospital at Newchwang, China, in 1899-1900. He was also lecturer on pathological anatomy, Tokio Dental College in 1898-99. In 1901 he came to the United States and studied at the University of Pennsylvania, where he became assistant in pathology in 1901-03. In 1903-04 he was in Copenhagen, connected with the Staten Serums Institute. Returning to the United States, he worked in the Carnegie Institute in Washington in 1903-04. In 1904 he joined the staff of the Rockefeller Institute for Medical Research, New York, of which he became a member in 1914. His contributions to medical science are the following: special attention to serpent venoms; a method for obtaining a pure vaccine for smallpox; pure cultivation of syphilitic organisms; microscopy of infantile paralysis; the presence of *treponema pallidum* in the

brain of general paresis and in the spinal cord of locomotor ataxia; and introduction of a skin test for syphilis. He is the author of the so-called Noguchi luetin reaction. He is a Fellow of the New York Academy of Sciences; and a member of the Association of American Pathologists and Bacteriologists; Association of American Physicians; and many others. He was knighted by King Alfonso of Spain in 1913, by King Christian of Denmark in 1913 and by the king of Sweden in 1914. The Emperor of Japan gave him the Order of Merit in 1915. He has published 'Snake Venoms' (New York 1909); 'Sérum Diagnosis of Syphilis and Luetin Reaction' (1910; 3d ed. 1912). Consult Paget, S., 'Noguchi's Researches in Infective Diseases, *Science* (N. S., Nov. 21, 1913); Portrait in *World's Work* (January 1914).

NOGUCHI, Yone, Japanese poet: b. Tsumishima in 1875. He was educated at the Otani School, Nagoya, under the support of the main Buddhist temple of the Otani sect, at the Nagoya High School and at the Tokio University. In 1893 he came to the United States, arriving in San Francisco, where he suffered extreme poverty. He made some friends among American writers and stayed for a time with Joaquin Miller. In 1897 he published 'Seen and Unseen: or Monologues of a Homeless Snail,' and in the next year 'The Voice of the Valley,' a little book inspired by a stay in the Yosemite. In 1902 he went to England and lived with Yoshio Markino, a Japanese artist, in poor lodgings in the Brixton Road, London, producing here a little book 'From the Eastern Sea,' the cover of which was designed by Yoshio Markino. During his stay in England he lectured at Oxford on Japanese poetry. In 1903 he went to New York and returned to Japan. He crossed to China and traveled for about a year and in 1906 he published in Tokio 'The Summer Cloud.' He writes frequently under the *nom de plume* of 'Miss Morning Glory.'

Besides the books mentioned Yone Noguchi has published 'The American Diary of a Japanese Girl' (1902, 1913); 'The Pilgrimage' (1909-12); 'Lafcadio Hearn in Japan' (1911); 'Through the Torii' (1914); 'The Spirit of Japanese Poetry' (1914); 'The Spirit of Japanese Art' (1914). Consult 'The Story of Yone Noguchi told by himself,' illustrated by Yoshio Markino (London 1914); and Ransome, Arthur, 'Portraits and Speculations' p. 189 (London 1913).

NOILS (also Noyls), the short and broken fibres and knots of wool that are combed out of the long staple. Noils are afterward carded and spun into coarse woolen yarn. They are also used for felting. Noils are, therefore, the short refuse wool which remains entangled among the teeth. There are many grades of noils. The word seems to come from the Latin *nodus*, a knot, and through the Old French *noill*, *nuil* or *newel*, a button or stone of a fruit, and the modern French *noyau*, a kernel.

NOIRÉ, nwā-rā, Ludwig, German philosophical writer: b. Alzey, Hesse, Germany, 26 March 1829; d. Mayence, Germany, 26 March 1889. He was educated in Giessen and taught for many years in the gymnasium at

Mayence, giving himself meantime to philosophical study. He wrote 'Die Welt als Entwicklung des Geistes' (1874); 'Einleitung und Begründung einer monistischen Erkenntnisstheorie' (1877); 'Logos' (1885).

NOISELESS POWDER. See EXPLOSIVES.

NOISSEVILLE, nwäs-vêl, France, a village five miles east of Metz, celebrated as the scene of Bazaine's attempt to break through the line of German besiegers, 31 Aug.—1 Sept. 1870. With 120,000 men and 600 guns, he attacked Manteuffel with 41,000 men and 138 guns, drove him back and took the villages of Montoy, Servigny and Courcy, but German reinforcements arriving on the second day, Bazaine was compelled to fall back upon Metz.

NOLA, nō'lā, Italy, city and episcopal see in the province of Caserta, 16 miles east by north of Naples. It is said to have been founded by the Etrurians before Rome was built, and 313 B.C. it became a part of the Roman territory. It successfully resisted an attack of Hannibal in the Second Punic War. Nola claims to have made, in the 5th century, the first bells used in Christian churches and the festival of Saint Paulinus, their inventor, is faithfully observed. Giordano Bruno (q.v.) was born in Nola and Augustus died here in 14 A. D. Nola is celebrated for its antiquities, which include a portion of a church of the 4th century. Pop. 14,900.

NOLDEKE, nêl'dê-kê, Theodor, German orientalist: b. Harburg, Germany, 2 March 1836. He was educated at the gymnasium of Lingen, Hanover, and at the University of Göttingen. In 1859 he won the prize offered by the French Académie des Inscriptions with his history of the Koran, which he wrote in French and translated into German in the following year. He was privat-docent at Göttingen in 1861-64, and then was appointed assistant professor there. In 1868-72 he occupied the chair of theology at Kiel and was then called to the professorship of Oriental languages at Strassburg from which he retired in 1906. A scholar of wide attainments, he has made a speciality of the Semitic languages and of Oriental philology and history, in which departments he is a leading authority. He is a voluminous writer, nearly 600 titles being set against his name. Much of his work is intended for specialists only, yet much of his writing is intended for the general public. He has published 'Das Leben Muhammeds' (1863); 'Die alttestamentliche Litteratur' (1868); 'Grammatik der Neusyrischen Sprache' (1868); 'Untersuchungen zur Kritik des Alten Testaments' (1869); 'Mandäische Grammatik' (1874); 'Aufsätze zur persischen Geschichte' (1887); 'Orientalische Skizzen' (1892), translated into English in that year and revised by him; 'Beiträge zur semitischen Sprachwissenschaft' (1904); 'Burzoes Einleitung zu dem Buche Kalila wa Dimna' (1912); 'Untersuchungen zur Achikar-Roman' (1913).

NOLHAC, nōl-äk, Pierre de, French historian and critic: b. Ambert, 15 Dec. 1859. He studied at the French school in Rome, worked for a year in the Bibliothèque Nationale, in 1886 became professor of history and classical philology in the École des Hautes Etudes, and in 1892 was appointed conservator of the Ver-

sailles Museum. Among his literary and historical studies are 'Lettres de Joachim du Bellay' (1884); 'La Bibliothèque de Fulvio Orsini' (1887); 'Erasmus en Italie' (1888); 'Marie Antoinette' (1890); 'Petrarque et humanisme' (1892); 'Histoire du château de Versailles' (1899-1900); 'Louis XV et Marie Leczinska' (1900); 'La création de Versailles' (1901); 'Louis XV and Mme. de Pompadour' (1902); 'Les jardins de Versailles' (1905); 'Nattier, peintre de la Cour' (1905); 'Poèmes de France et d'Italie' (1905); 'Versailles et Trianon' (1909); 'Le Trianon de Marie Antoinette' (1914), and works on Fragonard, Francis Boucher, Mme. Le Brun and Hubert Robert.

NOLI ME TANGERE ("Touch me not"), the words spoken by the risen Christ to Mary Magdalen (John xxviii, 7). The subject was a favorite in Italian art. It frequently appears in cycles representing the life of Christ as in Giotto's frescoes in the Arena Chapl, Padua, and in Duccio's frescoes in Siena. Fra Angelico, Martin Schöngauer (15th century) and Lorenzo di Credi (Uffizi) also painted this subject beautifully. The most famous of all paintings on this theme is the one by Titian, representing Christ and the Magdalen in the foreground of a beautiful landscape, the Magdalen on her knees raising her hand to touch Christ, who draws back his robe uttering the words "Touch me not." It was painted about 1518, and bought by Rogers, the poet, who bequeathed it to the National Gallery, London, in 1855. The canvas measures about four feet by three. A smaller picture by Titian, a fragment only of the original, representing the figure of Christ in a white tunic and blue mantle is in the Madrid Museum. It was taken to Spain by Mary of Burgundy in 1556. The Escorial has a copy. The Madrid Museum has a 'Noli me Tangere' by Correggio, representing Christ and Mary Magdalen. It was owned by Philip IV, and was originally in the Escorial. This is about four by three feet. Albertinelli's 'Noli me Tangere' is in the Louvre. This is a small work: Christ is leaving the sepulchre and Mary Magdalen is kneeling before him. It was painted between 1490 and 1500 and shows the influence of Fra Bartolommeo. This picture belonged to Louis XIV. Consult Jameson, Mrs., 'History of Our Lord in Art' (Vol. II, pp. 278-285, London 1865).

NOLL, nōl, a name by which Oliver Cromwell (q.v.) was popularly known.

NOLLE PROSEQUI (no prosecution). A technical term in English law, signifying that the proceedings against the defendant shall be discontinued. This originated in England in the reign of Charles II. In the United States the *nolle prosequi* is confined almost exclusively to criminal cases. The codes regarding the methods of procedure differ slightly in the different states. In some states the prosecuting officer may enter a *nolle prosequi* at his discretion; in others the permission of the court must be obtained. The term is sometimes shortened to *nol. pros.* See NONSUIT; PLEADING; PRACTICE.

NOLLEKENS, nōl'ê-kênz, Joseph, English sculptor: b. London, 11 Aug. 1737; d. there, 23 April 1823. He was the son of a painter of Antwerp who had settled in England, and after studying sculpture at Rome became very suc-

cessful in the execution of portrait busts, and was elected to the Royal Academy in 1772. He modeled busts of George III, Pitt, Canning and Castlereagh. His finest ideal statue is 'Venus with the Sandal.' He was exceedingly penurious in his habits and left a fortune of \$1,000,000. Consult 'Nollekens and his Times,' by J. T. Smith (Gosse's edition, 1895).

NOMA. See CANCRUM ORIS.

NOMADS, a general name given roaming or wandering people or tribes without fixed habitations, and generally pastoral. Nomadic tribes are seldom found to quit their wandering life until they are compelled to do so by being surrounded by tribes in settled habitations, or unless they can make themselves masters of the settlements of a civilized nation. But this change commonly takes place by degrees. Some of the greatest revolutions in history have been effected by these wandering tribes. North Africa, the interior of South Africa, and the northern and middle parts of Asia, are still inhabited by nomadic tribes. Different tribes, however, possess different degrees of civilization. Some are little better than bands of robbers.

NOMARCHY, or **NOME**. (1) The largest political division of Greece, which is divided again into demarchies. There are 30 nomarchies in Greece. The nomarchy corresponds to the French prefecture. The nomarch, or governor of a nomarchy, is appointed by the king on the nomination of the Minister of the Interior; but the demarchs, who assist them in the work of administration, are popularly elected. Prior to 1899, the eparchy formed the divisional unit below the nomarchy, but at that date it was abolished. (2) The name given by the Greeks to the provinces into which Egypt was divided, from the earliest historical period to the end of the Roman rule.

NOMBRE DE DIOS, nôm'brâ dâ dê'os, Mexico, city in the state of Durango, about 150 miles from the Gulf of California, and 30 miles southeast of Durango, the nearest railroad station. It was the earliest Spanish settlement in Mexico, and is situated in a region noted for its extensive deposit of silver ore. Pop. 11,000.

NOME, nôm, Alaska, city in the north-western part; on the north shore of Norton Sound (q.v.) at the mouth of Snake River, 14 miles west of Cape Nome. It is the commercial centre of an extensive gold mining district, including a large part if not all of Seward Peninsula district which contributes to the wealth of Nome. The placer gold fields, so dependent upon water for their development, are not continuous; rich deposits may have long intervening stretches where as yet no gold has been found. Nome came into existence as a mining camp in 1898-99 when gold was discovered in the creeks and streams of the vicinity, and the value of the beach deposits was recognized. Angelo Heilprin, president of the Philadelphia Geographical Society, is authority for the statement that out of the Nome sands "in barely more than two months" has been taken over \$1,000,000 by the crude method of "rocking." Nome is the shipping point for Council City, second in size to Nome. The tin found in the

vicinity of Cape Prince of Wales, and at Cape York, 90 miles northwest of Nome, is of industrial interest to Nome. Short narrow gauge railroads connect several of the mining camps with the city. The gold output for 1913 was about \$2,500,000. The harbor is closed by ice the greater part of the year, so that the city is active only from June to October. The city government is well organized, with all the departments essential for proper maintenance and operation. The streets are lighted by electricity; it has a good water system, free mail delivery, and many of the modern conveniences found in cities in older settlements of the United States. There are steamer connections with Seattle and the Yukon. Pop. about 5,000. See ALASKA.

NOME, (1) in music (especially in ancient Greek) any melody which was made up from or depended on natural or inviolable rules. (2) A province or other political division of a country, especially ancient Egypt and modern Greece. See MONARCHY.

NOME, Cap. See CAPE NOME.

NOMINALISM, a name of one of two rival schools of mediæval philosophy. The discussion arose respecting the nature of our general or abstract ideas, or of "universals." It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called realism and was the view which had been maintained by Plato. Those who held the opposite view were called Nominalists, because they maintained that there is nothing general but names; the name "circle" is applied to everything that is round, and is a general name: but no independent fact or property exists corresponding to the name. Specifically the controversy was as to the existence of "universals" or of genera and species, and arose out of a passage in the Latin translation of Porphyry's 'Isagoge.' Roscellinus, canon of Compiègne, in the latter part of the 11th century, was the first advocate of nominalism, and maintained, in opposition to the advocates of realism, that general ideas have no separate entity. He was charged with holding heretical opinions concerning the Trinity, for which he was cited before the Council of Soissons and condemned 1092 A.D. His first great opponent was Anselm, archbishop of Canterbury, and later Abelard, who had been a pupil of Roscellinus, modified his master's views into what is known as conceptualism.

NOMINATION. See CAUCUS.

NOMINATIONS, Political. See CONVENTIONS, POLITICAL.

NOMOCANON, in the Greek Church, a systematic collection of ecclesiastical laws, including certain secular enactments, especially imperial decrees, which have an ecclesiastical bearing. The most important is the Nomocanon of Photius (883) which was republished at Rome 1842 in the 'Spicilegium Romanum,' and the 'Syntagma' of Matthew of Blastares (1335).

NON-ACTIVITY. See NEUTRALITY.

NON-COMBATANTS, a term used in warfare for officers and privates charged with

administrative duties and who do not fight unless in self-defense; also for residents of a belligerent state who take no part in war.

NON-COMMISSIONED OFFICERS, in the army are officers intermediate in rank between the commissioned officers and privates or marines. They hold rank, not by commission from the executive authority, but by appointment of a superior officer. They are selected from the rank and file, and are generally the most meritorious of these. They vary in rank and comprise sergeants-major, sergeants, drum-majors, corporals. Their duties are various, but in general it may be stated that they overlook the men when off parade and while in barracks. They can only be reduced to the ranks by the colonel-commandant or by court-martial. A grade of officers above non-commissioned officers are the warrant officers. See UNITED STATES — ARMY.

NON COMPOS MENTIS, *nōn kōm'pōs mēn'tis* ("not of sound mind"), an expression used of a person who is not of sound understanding. See INSANITY.

NON-EUCLIDEAN GEOMETRY. See GEOMETRY, NON-EUCLIDEAN.

NON-FEASANCE (not doing), a legal term signifying the omission of some act which one is under a legal obligation to perform. The rule of law is that no action lies for non-feasance, i.e., for failure or refusal to perform the obligation, but that an action does lie for mal-feasance (or mis-feasance), i.e., for negligently or improperly performing the obligation. Polson in 'English Law' writes: "Misconduct of officers of justice, being what the law terms malfeasance, that is, wrong doing, or culpable non-feasance." Some writers are of the opinion that non-feasance never amounts to a tort; but this is erroneous. For example, if the owner of a factory fails to comply with a law requiring him to equip his factory with fire-escapes, in case of fire he is liable in damages to the persons injured. His omission in non-feasance and his non-feasance is a tort. The word comes from the Latin *non* and *facere*, to make, through the French *faisant* of the verb *faire*. Consult Jagard, E. A., 'Handbook of the Law of Torts' (Saint Paul 1895).

NON-INTRUSIONISTS, those members of the Scotch Established Church who contend for the principle that no minister should be intruded on a parish contrary to the will of the congregation. The name originated in a resolution, bearing this import, proposed by Dr. Chalmers and seconded by Lord Moncreiff in the General Assembly in 1833. It was to meet these views that the General Assembly, in 1834, passed the Veto Act, which brought the Church into conflict with the law courts and the disruption from which the Free Church of Scotland came into being in 1843.

NON-PARTISAN PRIMARY. See PRIMARY, DIRECT; ELECTIONS.

NON POSSUMUS, "We cannot," an expression used by Pope Clement VII in reply to Henry VIII's demand for the dissolution of his marriage with Catharine of Aragon; used in general expression for the refusal of the Roman Catholic Church to yield to the demands of the temporal power.

NON-RESISTANCE, Doctrine of, is that it is unlawful, on religious grounds, to resist the commands of a ruler or magistrate. This view is held by the Friends and is to be found in the works of Tolstoy. The New Testament writers urge the necessity of obedience to those in authority, although, as usually understood, this teaching refers only to lawful commands. It has, however, been maintained that obedience is to be rendered to all the commands of a ruler without exception.

NONANE, or **ENNEANE**, the ninth member of the series of the saturated fatty hydrocarbons or paraffins. It has the chemical formula C_9H_{20} and is theoretically capable of existing in no less than 35 different isomeric forms, a number of which have been actually identified. Two of these, having a common specific gravity of about 0.742, and boiling at 266° F. and 277° F., respectively, are known to exist in ordinary petroleum.

NONCONFORMIST, the name applied in the early part of the 17th century to those persons who, while adhering to the doctrine of the Church of England, refused to conform to its discipline and practice, chiefly in the matter of certain ceremonies, for example: the wearing of the surplice, kneeling at the reception of the Sacrament, signing of the cross after christening and the use of the ring in marriage. After the passage of the Fourth Act of Uniformity in 1662 and the ejection from their livings of those clergymen who refused to conform to that act, the term Nonconformists was applied to all those who by their opposition ceased to be members of the Established Church and who gradually formed themselves into sects. The history of this break in English Protestantism dates from the reign of Mary Tudor; but it does not become of real importance until the days of Elizabeth, when repugnance excited by the horrors of Mary's reign, hatred of Spain and the example of the reforms taking place in other centres of Europe strengthened the forces hostile to the Established Church. With the accession of Elizabeth, the Calvinist section, soon nicknamed "Puritans," returned from their voluntary exile. "In Geneva and Heidelberg," writes an authority, "they had learned to love the bare services and the elaborate preachments of the prevailing fashion." Europe, or a large part of it, owned in Calvin an intellectual and spiritual master and his authority was more absolute than that of most of the Popes. Swayed by these notions such men came back hoping for a "root-and-branch" revolution and anxious to reform the Church on the Calvinistic Presbyterian model. Thus, when it appeared that the new order would not only continue episcopacy, but would enjoin set prayers, sacerdotal vestments and outward sacramental signs there was a great outcry. The first few years of Elizabeth's reign were filled with the 'Vestiarian Controversy.' Elizabeth, however, who had very little personal religion, preferred an episcopal to a presbyterian system and retained ritual and such prelates as Matthew Parker (1504-75), to strike a balance between conservatism and innovation; to maintain the Prayer Book in spite of the Genevan party, and to adjust delicately, and yet firmly, the difficult questions of the day. Those who held Puritan views Elizabeth

cordially detested, as her forcible expressions plainly show; but, on the other hand, she was willing to conciliate them for the sake of their political support. Elizabeth's Act of Uniformity (the third), passed in 1559, ordered the use of the Second Prayer Book from 24 June 1559. Wishing to please the Puritans, Archbishop Parker, on an understanding with Queen Elizabeth, published certain "advertisements" addressed to the clergy, requiring them, at least, to conform to the wearing of a surplice, kneeling at communion, using the font for baptism, etc.; but the effect was small, for the Puritans became bolder and bolder until they demanded the substitution of an entirely Presbyterian régime, demanded by Thomas Cartwright in his First and Second Admonitions (1572) and followed by his 'Book of Discipline' (1580). In 1588 the 'Mar-Prelate Tracts' appeared and were hawked about the London streets. The violence of their attacks upon the queen and the bishops caused Elizabeth to take drastic measures. Perry and Udel, authors of the tracts, were tried and executed and Cartwright was imprisoned. The Marprelate Tracts, however, opened a rift in the Puritan party itself. They were the climax in the first Puritan assault upon the Established Church in favor of the 'Book of Discipline,' but the act passed in 1593 inflicting punishment to be followed by exile of a second offense on all who refused to attend the Established Church, or who held separate meetings, caused a division in the Puritan party. Some, retaining their beliefs outwardly, pretended to conform, while the extremists, for a time called Brownists (after their leader), fled to Holland; and a quarter of a century later sailed from Leyden and then from Plymouth in the *Mayflower*, 6 Dec. 1620, and settled in New England. With the death of Queen Elizabeth the hopes of the Nonconformists revived. Their system of doctrine and government was dominant in Scotland and they hoped for much from the Scottish James. They met him on his way to London and presented their 'Millenary Petition,' which requested that the ritual to which they objected should be abolished in the State Church. James promised them a conference, which met the next year (1604) at Hampton Court Palace. The king proved wholly on the side of the Established Church and the Nonconformists were disappointed. The same year Archbishop Bancroft, with the king's sanction, enforced the canons of 1604 restoring the rites in such parishes where the Puritans had succeeded in suppressing them. This controversy culminated in the long fight of Archbishop Laud (1573-1645) in his desire to rescue the Church of England from Calvinistic influence and who died a martyr. On the day that he was beheaded by the Nonconformists party the Book of Common Prayer was disestablished and the Directory was substituted for it by the Lords and Commons. "Thus," wrote a member of the Lower House, "the Archbishop and the Prayer Book died together." The supremacy was now transformed from the Crown to Parliament; the Solemn League and Covenant was accepted for the whole nation; and the Westminster Assembly of Divines met in Westminster Abbey as a permanent committee to reform the Church (1643). On the restoration of the king (Charles II) the Convocation

of 1662 revised the Prayer Book and forced its use. Those who refused to conform—and there were nearly 2,000 clergymen who did so—organized themselves outside of the Established Church and called themselves by the name of Nonconformists. Many repressive acts were passed against them, including the Five Mile Act, making liable to imprisonment any Nonconformist minister who came within five miles of the town from which he had been ejected. The next epoch in the history is the Toleration Act of 1689 regarded in its day as a charter of religious liberty. Many legal rights were allowed to the Nonconformists. With their conditions ameliorated, the Nonconformists were lapsing into quietude when the great Methodist, or Wesleyan, movement fired the dissenting sects to new activity. Under John (1703-91) and Charles Wesley (1707-88) and George Whitefield (1714-70) Methodism became a power in England at large and crossed the Atlantic to the United States.

In the 19th century the word Nonconformist was applied in England generally to all Protestant dissenters, i.e., to those who dissent from the Church of England. The great object of these sects, often referred to as a "Nonconformist party," has been to disestablish the Church of England. They form a body of no small political power. Though not succeeding in their aims, they have had several privileges accorded to them. Since 1836 dissenters have been allowed to be married by their own ministers and according to their own rites; the registration of births, marriages and deaths has been transferred from the Church to the State; a charter was given to the free University of London; the great universities of England have admitted Nonconformist students since 1871 and since 1880 the Burials Act allows the Nonconformist ministers access to the churchyards for funerals.

A sentence in a letter to the London *Times*, 28 Nov. 1890, reads: "The minimum demand of the great Nonconformist party is the abdication of Mr. Parnell. Nothing less will satisfy the Nonconformist conscience now." The phrase "Nonconformist conscience" appears as early as 1672, when Mervel wrote: "I suppose the Nonconformists value themselves though upon their Conscience and not their numbers." Statistics of 1918 with regard to the Nonconformists of Great Britain are as follows: Presbyterians: (Church of Scotland), 1,887 ministers; 721,158 communicants; 1,693 churches; income £491,982; (United Free Church of Scotland, consisting of the Free Church and United Presbyterian), 1,596 ministers; 518,747 communicants; 1,516 congregations; income £1,001,752. Free Church of Scotland, 88 ministers; 178 congregations. United Original Secession Church, popularly known as "Auld Lights" (seceders of 1733), 22 ministers; 3,247 communicants; £5,545 income. Presbyterian Church of England, 370 ministers; 355 congregations and 8 preaching stations. Presbyterian Church of Wales, 1,346 ministers; 184,694 communicants; 1,452 churches. Presbyterian Church in Ireland, 640 ministers; 103,760 communicants; 562 churches; £308,517 income. Methodists in Great Britain, 8,504 churches; 2,603 ministers; 494,993 communicants; 19,211 lay preachers. United Methodists, 2,727 churches; 649 ministers; 157,057 members. Primitive Methodists,

4,841 churches; 1,157 ministers; 205,217 members. Wesleyan Reform, 197 churches; 22 ministers; 8,317 communicants. Independent Methodists, 145 churches; 404 ministers; 8,770 communicants. Congregationalists (original Separatist, or Independents) British Isles, 4,989 churches; 3,062 ministers; 489,618 communicants. Baptists (possibly originally derived from the Lollards), British Isles, 3,158 churches; 2,070 ministers; 408,029 communicants. The total amounting to more than 30,326 churches and 3,139,602 church members. In addition to these sects, there are the Salvation Army, the Brotherhood Movement, Christian Endeavor Union, Moravian Church, Churches of Christ, The Countess of Huntingdon's Connexion, Disciples of Christ, Free Church of England, Society of Friends and the British and Foreign Unitarian Association. (See LOLLARDS; WYCLIFF; REFORMATION; HUGUENOTS; PRESBYTERIANISM; BROWNISTS; CONGREGATIONALISM; BAPTISTS; METHODIST CHURCHES; FRIENDS; CALVIN; LAUD; WESLEY; WHITEFIELD; FOX). Consult Neal, 'History of Puritans or Protestant Nonconformists, 1517-1688' (2d ed., London 1822); Price, 'History of Protestant Nonconformity in England from the Reformation under Henry VIII' (2 vols., London 1836); Bogue and Bennett, 'History of Dissenters, 1688-1808' (4 vols., London 1808); Bennett, 'History of Dissenters, 1808-38' (London 1839); Wilson, 'History and Antiquities of the Dissenting Churches' (4 vols., London 1808); Abbey and Overton, 'The English Church in the Eighteenth Century' (London 1878); Hetherington, 'History of the Westminster Assembly of Divines' (Edinburgh 1878); Clark, H. W., 'History of English Nonconformity' (2 vols., London 1911-13); Selbie, W. B., 'Nonconformity' (London 1913); 'The Literature of Dissent' in Cambridge History of English Literature, Vol. X (London and New York 1913).

NONES, nōnz, (1) in the Roman calendar the fifth day of the months January, February, April, June, August, September, November and December, and the seventh day of March, May, July and October. The *nones* were so called as falling on the *ninth* day before the *ides*, both days included. See CALENDAR. (2) The office of the Church recited at the ninth hour of the day (about 3 P.M.), but in practice earlier, from the common meaning of noon.

NONIUS, nō'nī-ūs, **Marcellus**, Latin grammarian: b. probably Thubursicum in Numidia at the opening of the 4th century A.D. His 'De Compendiosa Doctrina,' originally consisting of 20 books, is greatly esteemed on account of its many quotations from earlier writers whose works are lost. The 16th book is no longer extant. Consult editions by Quicherat (1871) and L. Müller (1888); also Nettleship, 'Essays in Latin Literature' (1885); and W. M. Lindsay (1903).

NONJURORS, in British history, those who refused to take the oath of allegiance to the government and Crown of England at the Revolution of 1688, when James II abandoned the throne. The nonjurors maintained the doctrine of passive obedience and non-resistance, and regarded the accession of William and Mary as a usurpation. They numbered

among them upward of 400 clergy and eight bishops of the Church of England and one archbishop, many of them men of learning and of blameless reputation, of whom the saintly Bishop Ken was one. They were of High proclivities, asserted the liberties of the Church in spiritual things and maintained an episcopal succession of their own. Although their sympathies and prayers were with the exiled house of Stuart, they were seldom actively disloyal to the *de facto* sovereigns. When in 1689 the Church Establishment in Scotland ceased to be episcopal, 300 nonjuring clergymen were deprived of their livings, to which Presbyterians were appointed; but they and their successors were more actively disloyal than their English brethren, participated largely in the Jacobite risings in 1715 and 1745 and were in consequence vindictively proscribed. On the death of the young Pretender in 1788, the Scottish Episcopal bishops made submission to the reigning house of Hanover. The last nonjuring English bishop died in 1805. Consult Lathbury, T., 'History of the Nonjurors' (London 1845); Ollard and Crosse, 'Dictionary of English Church History' (ib. 1912); Overton, J. H., 'The Nonjurors' (ib. 1902).

NONNUS, nōn'ūs, Greek poet of the 5th century of our era. He wrote the 'Dionysiaca,' an epic poem in 48 books relating the journeys and expeditions of Dionysius in lively and poetic style, full of taste and learning. He was a Christian and produced a poetic paraphrase of Saint John's Gospel. Consult Ludwich, 'Beiträge zur Kritik des Nonnos' (1873).

NONPAREIL, (1) a small and beautiful finch (*Cyanospiza ciris*) of the South Atlantic and Gulf States; sometimes called the painted bunting. It is nearly related to the indigo-bird (q.v.), and is frequently kept as a cage-bird, especially by the French people of southern Louisiana, who call it *le pape* (the pope). It is about the size of a canary, and, in the male, ultramarine blue over the whole head and neck, excepting a narrow stripe from the chin to the breast, which, with the under parts generally and the rump, is vermilion red; there are touches of green about the shoulders. The female is clear dark green above and yellowish on the lower surfaces. Its song is a series of melodious warblings, and its nest is placed in bushes and low trees, and contains pearly white eggs marked with purplish and reddish brown. (2) In typography, 6-point type, or 12 lines to the inch: in America the size of type between minion and agate, and in England between emerald and ruby.

NONSENSE, **Fort**, in American history, the name of a former fort near Morristown, N. J., projected by Washington to keep his discouraged and famished army from revolting during the winter of 1779-80. The Washington Association of New Jersey erected a memorial stone on the site of the earthworks in 1888.

NONSUIT, *in law*. See NOLLE PROSEQUI.

NONYL, or **ENNYL**, *in chemistry*, a group of organic radicals whose common empirical formula is C_8H_9 , and whose hydrides are the nonanes (q.v.). The nonyls are analogous to ethyl and nethyl in their chemical behavior, and, like these, cannot exist in the free state. The derivatives of the nonyls have

been very little studied as yet, because they are of no commercial importance, and their relations are exceedingly complicated, owing to the large number of possible isomeric forms that each of them can have. Several of their alcohols, amines and chlorides have been prepared, however.

NONYLENE, or **ENNYLENE**, the ninth member of the olefine series of fatty hydrocarbons. It has the chemical formula $C_{10}H_{18}$, and is capable of existing in many isomeric modifications. All of these modifications that are known are liquid. The specific gravity lies between 0.7 and 0.9, and the boiling-point between 230° F. and about 300° F.

NOOTKA (noot'ka) **INDIANS**, a name given to several North American Indian tribes of the Wakashan family, residing chiefly on Vancouver Island, but extending from Cape Cook on the north to beyond Port San Juan and including the Wakah of Cape Flattery, Washington.

NOOTKA SOUND, Canada, an indentation on the west coast of Vancouver's Island. See VANCOUVER ISLAND.

NORBERT, Saint. See PREMONSTRATENSIANS.

NORCHIA, nôr'chê-ä, **The Biga of**, in archæology, a name given to the remains of a biga, or two-horse chariot, discovered in 1901 in the course of some excavations undertaken by a country builder at Norchia, a small town almost 30 miles north of Rome, in what was once a populous part of Etruria. With it were found a number of bronze vessels and some pieces of pottery, of a character familiar among Etruscan remains. These remains were purchased by the Metropolitan Museum of Art in New York, and placed on exhibition.

NORD, nôr, France, a northeastern frontier department bordering on Belgium and the North Sea; area, 2,229 square miles. Capital, Lille. The coast, marked by a long chain of sandy hillocks, furnishes the two harbors of Dunkirk and Gravelines. The interior is a monotonous but fertile alluvial flat, intersected by sluggish streams and canals. A great part is in the basin of the Sambre. The department, while essentially agricultural, upward of four-fifths of the area being under cultivation, is also first of the departments in industry, there being great textile industries, important iron and steel works, porcelain and glass manufactures and productive coal-mines. Part of it was in German occupation during the Great War. Next to the Seine, it is the most populous of French departments. Pop. 1,961,780.

NORDAU, Max Simon, German physician and author: b. Budapest, Hungary, 29 July 1849; d. 22 Jan. 1923. He studied at the University of Budapest, receiving his degree in 1872; he then traveled for six years, visiting the principal countries of Europe, and in 1878 began the practice of medicine in Budapest. In 1880 he went to Paris, and after two years of study resumed the practice of his profession there. He began his literary career at Budapest before entering the university as contributor and dramatic critic for *Der Zwischenact*; he subsequently was an editorial writer and correspondent for several other newspapers. His news-

paper writings were collected and furnished the material for his earlier books, including 'Pariser Studien und Bilder' (1878); 'Seifenblasen' (1879); 'Vom Kreml zur Alhambra' (1880); 'Paris unter der dritten Republik' (1881), which are mostly criticisms of political and social conditions. In 1883 he published 'Die konventionelle Lügen der Kulturmenschheit' (English translation, 'Conventional Lies of Society'), in which he showed what he believed to be the essential falsity of some of the social, ethical and religious standards of modern civilization; and in 1892 published 'Entartung,' translated into English under the title 'Degeneration.' This is his best-known work and provoked much criticism; in it he maintained that the civilization of the present, the new inventions and the growth of great cities have resulted in the degeneration of man, especially of the higher classes; that this degeneration is seen particularly in the lowered, and often depraved, standard of literature, art and music; and that the authors and artists of the day whose work is in accordance with these standards are themselves mental and moral degenerates. He was a disciple of Lombroso. His other works include 'Paradoxe' (1885; in English, 'Paradoxes'); 'Die Krankheit des Jahrhunderts' (1887; in English, 'The Malady of the Century'); 'Seelen Analysen' (1892); 'Die Drohnenschlacht' (1897); the novel, 'Gefühlskomödie' (1891; in English, 'A Comedy of Sentiment'); and the dramas, 'Der Krieg der Millienen' (1882); 'Das Recht zu lieben' (1893); 'Die Kugel' (1894); and 'Dr. Kuhn' (1898); 'The Drones Must Die' (1899); 'Zeitgenössische Franzosen' (1901); 'Morganatic' (1904); 'On Art and Artists' (1907); 'Die Sinn der Geschichte' (1909); 'Zionistische Schriften' (1909); 'Mörchen' (1910); 'Der Lebenssport' (1912). After the outbreak of the Great War he was, being a native of Hungary, accused of German sympathies; but he repudiated the charge, and afterward went to reside in Madrid. Dr. Nordau was a Jew and was one of the prominent leaders of the Zionist movement. An attempt to assassinate him was made in the latter part of 1903.

NORDENBERG, nôr'dên-bärj, **Bengt**, Swedish artist: b. Kompikalla, Sweden, 22 April 1822; d. Düsseldorf, 14 Dec. 1902. In his early years he was a house-painter. In 1843 he went to Stockholm and studied in the Academy while still following his trade. In 1851 he went to Düsseldorf and studied under Theodor Hilderbrandt. In 1857-58 he studied in Paris under Couture, after which he visited Italy. He finally settled in Düsseldorf. Nordenberg was much influenced by Tidemand. His subjects were drawn chiefly from Swedish peasant life. They include 'Communion in a Village Church' (National Gallery, Christiania); 'The Organist' (Leipzig Museum); 'Laying the Tithe in Skåne' and 'Wedding Procession in Varend' (both in the Stockholm Museum); 'A Golden Wedding' and 'A Forest Fire.' Nordenberg was given a medal at Lyons in 1866, at Stockholm in 1845, 1847 and 1848 and London in 1879. He had honorable mention at the Paris Salon of 1864 and at the Vienna Exhibition in 1873.

NORDENFELT, nôr'dên-fêlt, **Torsten Vilhelm**, Swedish inventor: b. 1842. After a thorough technical training, from 1862 to 1866

he was engaged in promoting the sale of Swedish iron in London; and early in the eighties established in Sweden, England and France factories for the production of ammunition, machine guns, torpedoes and submarine torpedo boats. Soon afterward with Hiram S. Maxim (q.v.) he formed the Maxim-Nordenfelt Company. Oscar II of Sweden named him royal chamberlain in 1885. Nordenfelt's best-known invention is a machine gun, intended as a defense against torpedo boats, made with from 2 to 12 barrels, from any one of which the supply of ammunition can be shut off without interfering with the other barrels. See MACHINE GUN.

NORDENSKIÖLD, nôr'dën-shêld, **Adolf Erik**, BARON, Swedish Arctic explorer: b. Helsingfors, 18 Nov. 1832; d. Dalby, Sweden, 12 Aug. 1901. He was educated in Finland at the University of Helsingfors by his father, Nils Gustav Nordenskiöld (1792-1865), a mineralogist, with whom he explored parts of the Urals. He was graduated in 1857, and in 1858 became superintendent of the mineralogical department of the Swedish Royal Museum in Stockholm, having been forced to leave Finland by the Russian authorities, who took umbrage at his political views. In all subsequent Arctic expeditions sent out by the Swedish government he took part, accompanying Torrell to Spitzbergen in 1858 and 1861, and being leader himself in 1864 and in 1868, when he attained 81° 42' the farthest north at that time reached on board ship. Oscar Dickson, a wealthy gentleman of Gothenburg, who had contributed to previous exploration funds, made it possible for Nordenskiöld to explore Greenland in 1870, a preliminary expedition, which, however, made important discoveries of algæ and meteorites and penetrated the island farther than had ever been done before. In 1872, after serving two years in the Swedish lower house of Parliament, where he allied himself with the Liberal party, Nordenskiöld set out on the fifth Swedish expedition, which wintered in Mossel Bay, whence with a few comrades he pushed north in the spring of 1873 on sledges. In 1875 and 1876 he led the expeditions sent out by Dickson across the Kara Sea and up the Yenesei River. These were mere preparations for his great exploit in 1878-80 when he accomplished the Northeast Passage, the dream of explorers for over three centuries. He left Karlskrona 22 June 1878; wintered in the ice near Bering Strait, and reached Yokohama 2 Sept. 1879, and returned to Europe by the Suez Canal. He was created a baron in 1880. In 1883 he again explored Greenland from the west coast, beating his previous record of the farthest inland. The remaining years of his life were spent in the study of early cartography, his publications in this field being 'Periplus, an Essay on the Early History of Charts and Sailing Directions' (1897); an edition of Marco Polo, in French with facsimile (1882); 'Bidrag til Nordens äldsta historia' (1892), in honor of the American Columbian celebration, and accompanied by the earliest maps of North America. Most of his important explorations were also described by his pen. Consult Leslie, 'Arctic Voyages of Nordenskiöld' (1880); and the 'Life' in Swedish, by Andersson (1901).

NORDENSKIÖLD, Gustav, Swedish explorer, son of A. E. Nordenskiöld (q.v.): b. Stockholm, 1868; d. Mörsill, 6 June 1895. He explored Spitzbergen in 1890 and the Colorado cañons in 1891, and described the latter in a work translated by Morgan under the title 'The Cliff Dwellers of the Mesa Verde' (1893).

NORDENSKIÖLD, Nils Erland Herbert, BARON, Swedish ethnologist: b. Stockholm, 19 July 1877. He is the son of A. E. Nordenskiöld (q.v.); after an education at Upsala, in 1906-08 he became connected with the Museum of Natural History, Stockholm. In 1913 he was made director of the ethnographic division of the Göteborg Museum. Between those years he traveled and made collections for the museums in Stockholm. He visited Patagonia in 1899; Argentina and Bolivia in 1901-02; Peru and Bolivia in 1904-05; Bolivia in 1908-09; and in the interior of South America in 1913. In 1912 he received the Loubat prize and the Wahlberg gold medal. In addition to numerous articles in scientific periodicals, he has published 'Från högfjäll och urskogar' (1902); 'Indianlif i el gran chaco' (1910); 'Indianer och hoita' (1911); and 'Sydamerikas indianer' (1912).

NORDENSKIÖLD, Nils Otto, Swedish explorer and geologist, nephew of A. E. Nordenskiöld (q.v.): b. Smaland, 6 Dec. 1869. He was educated at Upsala, where he was graduated with a doctor's degree in 1894. In 1895-97 he accompanied the scientific expedition to Patagonia under Ohlin; in 1898 traveled through the Klondike and Alaska; in 1900 was a member of the Danish expedition under Amdrup to the eastern coast of Greenland; and in October 1901 left Gottenburg on the Antarctic to explore the south polar regions. His ship was sunk in Erebus and Terror Gulf in the early part of 1902, and he and his men encamped on Paulet Island, whence they were rescued by the *Uruguay*, a gunboat sent out by the government of Argentina. In 1909 he explored the southwest of Greenland. He was appointed professor of geography at Gottenburg in 1905. He is the author of 'Antarctica' (1901-04), and 'Geology and Physical Geography of East Greenland' (1909).

NORDERNEY, nôr'dër-nî, Germany, one of the East Friesian Islands, three miles from the coast of Germany and belonging to the province of Hanover. It is about eight miles long and a little over one mile wide, and is accessible from the mainland at low tide. It is treeless, covered with dunes which are from 50 to 75 feet in height. At the southwest extremity is a village which is protected from the sea by a wall, and the lighthouse in the centre of the island may be seen many miles. The island is the most important of the group on account of being a favorite sea-bathing place. Pop. about 4,300.

NORDHAUSEN, nôrd'hôw-zën, Germany, city in the province of Saxony, on the Zorge, 40 miles north-northwest, of Erfurt. It is at the base of the Hartz Mountains and the west end of the fertile "Goldene Aue" that is, "golden plain." It has 70 large distilleries of corn brandy ("Nordhäuser schnaps"), breweries, tanneries, chemical works and tobacco factories and a great export trade in ham and other hog

products. A quaint town-hall, a Gothic cathedral and the church of Saint Blasius, which has two paintings by Lucas Cranach, are all of interest. It became a free imperial city in 1253. Pop. 32,564.

NORDHEIMER, nôrd'hîm-ër, **Isaac**, American Orientalist: b. Memelsdorf, Germany, 1809; d. New York, 30 Nov. 1842. He was graduated from Munich in 1834; in 1835 he came to New York and was instructor in sacred literature in Union Seminary (1838-42), and professor of Hebrew at the New York University (1836-42). His 'Hebrew Grammar,' an elaborate work in two volumes, appeared in its second edition in 1842. His other works include 'A Grammatical Analysis of Scripture or a Chrestomathy' (1838); 'A Philosophy of Ecclesiastes' (Biblical Repository July 1838). He left in manuscripts valuable grammars of Syriac and Arabic.

NORDHOFF, nôrd'hôf, **Charles**, American journalist and author: b. Erwitte, Westphalia, Prussia, 31 Aug. 1830; d. San Francisco, Cal., 15 July 1901. He came to the United States with his parents in 1835, and in 1843 was apprenticed to a printer in Cincinnati. In 1844 he joined the United States navy and served three years, in which time he made a voyage round the world. He continued to go to sea in merchant, whaling and fishing vessels until 1853, and from that time to 1871 (with the exception of four years spent in editorial work in a New York publishing house) was engaged in newspaper work. From 1871 to 1873 he traveled in California and Hawaii, and in 1874 became Washington correspondent for the New York Herald, retiring from journalism in 1890. He has described his experiences as a sailor in his 'Man-of-War Life' (1855); 'The Merchant Vessel' (1855); 'Whaling and Fishing' (1856; new ed., 1903), and 'Nine Years a Sailor' (1857). His sociological and political writings include 'Secession is Rebellion' (1860); 'The Freedmen of the South Carolina Sea Islands' (1863); 'Politics for Young Americans' (1875), which was adopted as a school textbook, and 'The Communistic Societies of the United States' (1874); this last is a description and history of different communistic colonies, and is a valuable contribution to descriptive sociology. His other works include 'Stories of the Island World' (1857); 'California for Health, Pleasure and Residence' (1872); 'Northern California, Oregon and the Sandwich Islands' (1874); 'God and the Future Life' (1881), and 'Peninsular California' (1888).

NORDICA, nôr'dî-ka, **Lillian**, American opera singer: b. (LILLIAN NORTON) Farmington, Me., 1859; d. Batavia, Java, 10 May 1914. She studied in the Boston Conservatory and under O'Neill made her first appearance in 1876 as a concert artist; in 1878 went to Europe with Gilmore's Band, studied at Milan under Sangiovanni and made her operatic début at Brescia in 'Traviata.' Her success was great; she was immediately engaged for the Imperial opera at Saint Petersburg, and after two years there appeared in Paris in 1882. In the same year she retired from the stage to marry Frederick A. Gower, whom she sued for divorce in 1885, but who disappeared at about the time of the suit, probably having been killed in a balloon

accident. She first appeared in London in 1887, and in New York in 1895. In 1894 she played Elsa in 'Lohengrin' at the Wagner Theatre in Baireuth, and in 1896 married the Hungarian tenor Doeme, who took the title rôle in 'Parsifal' at Baireuth in 1894. She obtained a divorce from him in 1904 and in 1909 was married to an American banker, George W. Young. Her repertoire was large and she was especially successful in Wagnerian opera and in 'Les Huguenots' and 'Aida.' In 1907-08 she was a member of Oscar Hammerstein's Manhattan Opera Company. In 1912 she appeared with the Boston Opera Company, and thereafter appeared only on the concert stage. In 1913 she set out on a concert tour of the world. She died as the result of exposure after the wreck of the steamer *Tasman* on the island of Java.

NÖRDLINGEN, nêrd'ling-ën, Germany, town in the northwestern part of Bavaria, on the Eger River, 75 miles northwest of Munich. Its history dates back to the year 900, and some of the buildings still remaining bear evidence of an even earlier date. It became an Imperial city in 1215. Two of the decisive battles of the Thirty Years' War were fought in Nördlingen; one 16 Sept. 1634, where Ferdinand, the king of the Romans, was successful and South Germany was freed from foreign rule, and the other 13 Aug. 1645 between the Imperial forces and the French,—the French were victorious. Nördlingen has considerable manufacturing interests in linen and woolen goods, carpets, leather, agricultural implements, furniture and toys, and there are large nurseries. It has schools of note and a large library. Pop. 8,705.

NORDRAAK, nôr'drâk, **Rikard**, Norwegian composer: b. Christiania, 12 June 1842; d. Berlin, 20 March 1866. He was a piano pupil of Kiel and Kullak in Berlin. At a very early period in his life he turned his attention to the study of Norwegian folksongs and composed music to the national hymn, "Ja, vi elsker dette landet," written by his cousin, Bjørnstjerne Bjørnson (1832-1910). In 1864 he met Grieg and inspired him with the idea of devoting his genius to Norwegian melody and the cultivation of a specifically national art. He wrote incidental music to Bjørnson's dramas of 'Mary Stuart' and 'Sigurd Slembe,' piano pieces and songs.

NORDSTRAND, nôrd'strânt, Germany, an island belonging to the North Friesian group, in the North Sea; area, about 21 square miles. Prior to 1634 the area was about 210 square miles, but that year a flood swept over the island, destroying the greater part of the land and drowning over 6,000 people. Many people on the islands of the vicinity were drowned. Pop. about 3,000.

NORE, nôr, a river in Ireland which has its rise in the mountains in the northeastern part of Tipperary, flows northeast into Queen's County, then southeast through Kilkenny, and after a course of about 70 miles, joins the Barrow River about two miles above New Ross. Kilkenny is the largest city on its banks.

NORFOLK, nôr'fôk, **Charles Howard**, 11th DUKE OF, English politician: b. 5 March 1746; d. London, 1815. Breaking with the traditions of his family, notably his father, a Roman Catholic and author of pamphlets on penal laws

against the Catholics, the son became a Protestant and a Whig; opposed the war with America; sat in Parliament 1780-84; became a lord of the treasury in the Portland Cabinet in 1783, and was dismissed in 1798 from the lord-lieutenancy of the West Riding for toasting the "sovereign English people" in terms displeasing to the Crown. He was noted for his convivial habits and his dislike of soap and water. At his death the title passed to Bernard Edward Howard, the first Roman Catholic peer to sit in the House after the Act of Emancipation in 1829.

NORFOLK, Henry Fitzalan-Howard, 15TH DUKE OF, English politician: b. Carlton Terrace, 27 Dec. 1847; d. London, 11 Feb. 1917. He succeeded to the title in 1860 upon the death of his father, whom he resembled in his zeal for the Roman Catholic Church. He was president of the Catholic Union of Great Britain; acted as special envoy to the Pope in 1887; with the Unionists he opposed Gladstone's Home Rule program; and from 1895 to 1900 was Postmaster-General. He served in the South African War.

NORFOLK, Henry Granville Fitzalan-Howard, 14TH DUKE OF, English politician: b. 7 Nov. 1815; d. Arundel Castle, Sussex, 25 Nov. 1860. He studied at Trinity College, Cambridge, became a zealous Whig and was always an ardent Catholic. He was a member of the House of Commons from 1837 to 1852; then breaking with his party on the Ecclesiastical Titles Bill of 1850 spent several years in Paris, where he was known as a friend of Montalembert, and in 1856, upon his father's death, entered the House of Lords, where he vigorously opposed Palmerston. He wrote various pamphlets on the Catholic question and the 'Lives of Philip Howard, Earl of Arundel, and Anne Dacres, His Wife' (1857).

NORFOLK, Henry Howard, 6TH DUKE OF, English nobleman, friend of Evelyn, the diarist: b. 12 July 1628; d. Arundel, Sussex, 11 Jan. 1684. He was a younger son of the 3d Earl of Arundel, lived abroad until the Restoration, and in 1667 presented the Arundel Library to the Royal Society and the famous Arundel marbles to Oxford University. He was envoy to Morocco in 1669, and succeeded his brother as duke in 1670. Consult Evelyn, 'Diary.'

NORFOLK, Henry Howard, 7TH DUKE OF, English politician, son of the 6th duke: b. 11 Jan. 1655; d. London, 2 April 1701. He studied at Magdalen College, Oxford; became lord-lieutenant of Norfolk, Berkshire and Surrey, and was so strong a Protestant that in spite of his personal attachment to James II he signed the petition for the Convocation Parliament in 1688, brought over the eastern counties to William of Orange and was made privy councillor in 1689.

NORFOLK, John Howard, 1ST DUKE OF (2d creation), English admiral, supporter of the house of York: b. about 1430; d. Bosworth, Leicestershire, 22 Aug. 1485. He was a great-grandson of Sir William Howard, founder of the family and chief justice of common pleas under Edward I and Edward II. He served in France, was elected to the Commons in 1455 by the interest of John Mowbray, last Duke of Norfolk of that name, thus becoming allied to

the house of York. He was knighted upon the accession of Edward IV, fought again in France and against the Lancastrians and in spite of this was made a baron by Henry VI. He became a lieutenant of Richard III, who made him Duke of Norfolk, earl marshal and admiral of England in 1483, and fighting for Richard at Bosworth he was killed. The title of Duke of Norfolk revived for him had been held by the Mowbrays, from whom he was descended on the distaff side.

NORFOLK, Thomas Howard, 2D DUKE OF, English soldier and statesman, son of John Howard, 1st Duke of Norfolk (q.v.): b. 1443; d. Framlingham, Suffolk, 21 May 1524. He was created Earl of Surrey in 1483, the title by which he is best known. Like his father he fought for Edward IV at Barnet (1471) and for Richard III at Bosworth (1485), and was attainted and imprisoned for over three years. He arranged the marriage between Margaret, daughter of Henry VII, and James IV of Scotland (1501). One of the best generals of his day, he put down the Yorkshire rising of 1489, defeated the Scotch at Flodden (1513), being created Duke of Norfolk after that battle, and on the "Evil May Day" of 1517 repressed with terrible severity a riot in London. The entire subservience to the Crown which marked his later years was shown by his concurring in the condemnation of Buckingham for treason, after acting as lord high steward of the court which tried his friend.

NORFOLK, Thomas Howard, 3D DUKE OF, English statesman, son of 2d Duke (q.v.): b. 1473; d. Kenninghall, Norfolk, 25 Aug. 1554. He married Anne, daughter of Edward IV; served in the navy and in 1513 under his father at Flodden. He opposed the policy of Wolsey and angered the king against him; was less successful in his opposition to Thomas Cromwell, and shared the spoil of the monasteries; and in 1546 with his son Henry, Earl of Surrey, was accused of high treason. He won the battle of Solway Moss in 1542. He was condemned and saved from death only by the demise of Henry VIII. He remained in the Tower during Edward VI's reign; but was restored to favor under Mary; and in his 81st year showed equal bravery and rashness in leading the forces against Wyatt (1544). His grandson, THOMAS HOWARD, 4th Duke of Norfolk, son of the Earl of Surrey: b. 1536; d. Tower Hill, 2 June 1572; became duke in 1554; gave largely to the foundation of Magdalene College, Cambridge, was sent to Scotland in 1568 to inquire into affairs there; attempted to marry Mary, Queen of Scots; and as head of the English nobility played a prominent part in the Ridolfi plot in her behalf. He was tried for treason and executed.

NORFOLK, Thomas Mowbray, 1ST DUKE OF (of the first creation), English statesman: b. about 1366; d. Venice, 1399. He was summoned to Parliament in 1383 as Earl of Nottingham; served in Scotland in the following year; joined in the prosecution of the favorites of Richard II by the Merciless Parliament; but was soon reconciled to the king and assisted him greatly in his tyrannical policy toward the nobles. Norfolk arrested Gloucester, Arundel and Warwick, and when bidden to produce

Gloucester for trial he said that the prisoner was dead, and very possibly he was responsible for Gloucester's death. He was made Duke of Norfolk in the same year, 1397; but in 1398 was accused of treason and banished from England.

NORFOLK, England, a county bounded north and east by the North Sea, south and southeast by Suffolk and west by Cambridgeshire and Lincolnshire. Norfolk is the fourth largest county in England. Its area is 2,053 square miles. The eastern and central portions, consist of an undulating plain with pretty river valleys and low chalk downs in the north. The principal rivers of the eastern section are the Yare and its tributaries Wensum, Bure and Waveney. Most of this part of Norfolk is well wooded and fertile and there is little heath land. The western part of Norfolk includes part of the fen country. Here the rivers are the Great Ouse and its tributaries, the Little Ouse, or Brandon which flows across the western boundary line of Suffolk, the Wissey and the Nor. The district known as Bedford Level extends from Welney and Hilgay Fens near the junction of the Great and Little Ouse northward to the Wash. In the middle eastern section lie the famous Norfolk Broads, shallow meres and marshes of an average depth of eight feet, luxuriant with reeds and water plants intersected by the lower courses of several rivers, particularly the Bure and its tributaries. The Broads abound in pike, bream and other fish and a vast number of water fowl, such as heron, bittern, snipe, teal, mallard and kingfisher. Generally speaking the coast line is flat and low with few river mouths. Several villages existing in 1066 have been engulfed by the ever-encroaching sea. From the mouth of the Yare—Yarmouth to Happisburgh—the shore is bordered by sand dunes, then come cliffs from 50 to 200 feet in height and then a low sandy coast extending to Saint Edmund's Point. West of Lynn much land has been reclaimed from the sea in modern times and south of this a Roman embankment runs into Lincolnshire. Submarine forests exist off the coast, particularly in Brancaster Bay and in the vicinity of Cromer and Happisburgh. Fossils of large mammals are occasionally found here by fishermen. The climate is cold owing to the exposed position of the coast to east and northeast winds. Fogs are common in the nearby districts and a characteristic mist called the "cynd" frequently covers the eastern parts.

Norfolk is mainly in the diocese of Norwich with small portions in those of Ely and Lincoln. The county is divided into six Parliamentary divisions. It returned members to Parliament as early as 1290. The city of Norwich now returns two members; the boroughs of King's Lynn, Norwich and Great Yarmouth each return one member in addition to the six divisions. The total number of civil parishes is 700. The municipal boroughs are King's Lynn, Norwich, Thetford and Yarmouth. The urban districts are Cromer, Diss, Downham Market, East Dereham, Hunstanton, North Walsham, Sheringham, Swaffham, Walsoken and Wells-next-the-Sea. Among the other towns are Holt, Fakenham and Wymondham. Assizes are held at Norwich. The Great Eastern Railway pro-

vides the principal railroad communication to Norwich and Yarmouth; Ely to Lynn; Lynn to Swaffham. There are many branch lines, including the Midland and Great Northern from Lynn to Kromer, Norwich, North Walsham and Yarmouth. Boats run down the eastern rivers to the port Yarmouth. The Great and Little Ouse are also navigable and are connected to Lynn by canals. The chief industries of Norfolk go back to historic times. Sheep raising flourished, horses were bred, bees were kept, salt was made, fisheries were important and there were about 600 water mills when the Domesday book was prepared (1086). Flemish immigrants introduced the worsted trade in the 13th century and the name came from the fact that this product first was manufactured at the town of Worstead. The leather business flourished in Norman times. Linen was made in Aylsham in the 14th century. Agriculture is still one of the features of Norfolk. About four-fifths of the total area is under cultivation. Wheat and barley are grown and oats for which Norfolk is famous. A fair amount of small fruit is cultivated. Pasture land is fine and much attention is given to the raising of sheep and cattle. The old Norfolk "polled stock" is a distinct breed. Fisheries are important, particularly those of Yarmouth. The Yarmouth "bloater," nicknamed the "Yarmouth pheasant," makes the tour of the world in tins or as "bloater paste." Silk is manufactured at Yarmouth, Wymondham and North Walsham. Worsted is one of the chief places in England for the manufacture of cloth; Norwich manufactures silk and wool, boots and shoes, weaves shawls and has extensive mustard and starch works. Flour mills and works for making agricultural implements are numerous throughout the county. Pop. 321,733. Consult 'Victoria History of the County of Norfolk' (London and New York 1901-06); Emerson, P. H., 'Pictures of East Anglian Life' (London 1888); Davies, G. C., 'Norfolk Broads and Rivers' (Edinburgh 1884); Dutt, W. A., 'Norfolk and Suffolk Coast' (New York 1910).

NORFOLK, Neb., city in Madison County on the Elkhorn River, 75 miles southwest of Sioux City on the Chicago and Northwestern and the Union Pacific railroads. It is a busy commercial centre and is situated in a rich agricultural district. Norfolk has a Federal courthouse, a public library, a State Hospital for the Insane, a United States weather bureau station, a fine park and municipal waterworks. Farming and cattle-raising are important industries. Large flour and cereal mills, creameries, bottling-works, packing-houses, concrete block, threshing-machine and washing-machine factories, a planing-mill and shops of the Northwestern system are other activities of the city. Pop. (1920) 8,634

NORFOLK, Va., city, port of entry, and United States naval station in Norfolk County, the second largest city of Virginia, on the Elizabeth River, which is an arm of the Chesapeake Bay, the Albemarle and Chesapeake Canal and Dismal Swamp Canal. It is 116 miles by water and 70 miles in a direct line southeast of Richmond, on the Atlantic Coast Line Railroad, the Seaboard Air Line, the Chesapeake and Ohio, the Norfolk and West-

ern, the Norfolk and Southern, the Southern and the New York, Philadelphia and Norfolk railroads. The city covers an area of about nine and one-half square miles and is laid out on rather level ground. The climate is genial, being tempered by the Gulf Stream, which runs nearer the shore off Capes Henry and Hatteras than at any other point along the Atlantic Coast. Among the prominent buildings are Saint Paul's Church, built in 1737, public library, Carnegie library, city hall, custom house, Saint Vincent's Hospital, Protestant hospital, post office, Norfolk Mission College, upward of 30 churches, an academy for young ladies, an institution for colored students, and there is a beautiful public park covering 95 acres. Norfolk has the commission form of government, which displaced the older form of mayor, common council and board of aldermen. The city budget exceeds \$5,642,934 annually; the principal items being interest on the net city debt of \$29,765,000; fire department, schools, street, sewer and drain department and police department. The municipal waterworks were built in 1872 and cost \$1,236,000. There are 70 miles of street mains in the system. The city's annual income is about \$6,000,000. The assessed valuation of all real estate of the city is \$145,109,662. Bank clearings in a recent year were \$399,747,000 and the gross postal receipts were \$730,948.

Norfolk is eight miles distant from Hampton Roads and 17 miles from the Atlantic Ocean. Norfolk and Portsmouth, on the opposite side of the Elizabeth River, constitute the largest naval station in the United States. The Norfolk navy yard is located at Portsmouth. The coaling station here handles over 3,000,000 tons annually. The harbor is commodious, accessible for the largest warships and has a main channel 30 feet deep. The defenses include Fortress Monroe. A United States customs district embraces both Norfolk and Portsmouth. The foreign trade in a recent year was represented by exports, \$17,541,324; imports, \$1,295,347. Norfolk is the terminus of many steamship lines, transatlantic and coastwise, and has a large boat traffic with the interior by canal. It is already an important commercial centre and is growing rapidly in this direction. The commerce of the port includes lumber, coal, grain, cotton, peanuts, oysters, fruit and vegetables. It is the leading peanut market of the world; is the fourth cotton port of the United States, with a business of 600,000 bales annually; an oyster trade of \$2,500,000 and a trucking business of \$6,000,000. Norfolk has several national and State banks, a chamber of commerce, board of trade, cotton exchange, real estate exchange. The Union stock yard here has an annual business of over \$2,500,000. The manufacturing industries represent capital to the amount of over \$11,000,000, with a production valued at about \$14,000,000. The industries include cotton knitting-mills, cotton compress-mills, fertilizer factories, shipyards, tobacco and cigar factories, iron foundries, machine shops, steel works, carriage and wagon shops, creosoting works, housing factories, steel shutter and blind factory, lumber mills, silk mills, barrel, box and crate factories, brickyards, bottling works, grain elevators, electric supply works and numerous

minor concerns. There are gas and electric light plants here, an electric traction system and daily and weekly newspapers. The town of Norfolk was first settled in 1680. It was bombarded and nearly destroyed by the British under Lord Dunmore, 1 Jan. 1776. In 1736 the town was incorporated as a borough and was chartered as a city in 1845. The city suffered severely in 1855 from an epidemic of yellow fever. During the Civil War, in April 1861, General Taliaferro entered the city with a large body of Virginia troops. In May 1862, the Federal army took possession of the city and during the interval from April 1861 to May 1862 the city was the chief Confederate naval station. A new charter was granted in 1906, and was amended two years later. In 1906, Berkeley, a suburb, was annexed. Pop. 115,777. Consult Burton, H. W., 'History of Norfolk' (Philadelphia 1877); Forrest, W. S., 'Historical and Descriptive Sketches of Norfolk and Vicinity' (Philadelphia 1853); Lamb, 'Our Twin Cities of the 19th Century' (Norfolk 1888).

NORFOLK ISLAND, in the Pacific Ocean, 400 miles northwest of North Cape, New Zealand, nearly midway between that colony and New Caledonia, and about 800 miles east of Australia, is six miles long and has an area of 10 square miles, rising in Mount Pitt to a height of over 1,000 feet. The climate is healthful and the soil fertile and well watered; lemons, grapes, figs and pineapples flourish; distinctive features of its flora are the Norfolk Island pine, growing to a height of 200 feet, and the Norfolk Island cabbage, a dwarf pine. Norfolk Island was discovered by Cook in 1774. Between 1788 and 1805, and again between 1826 and 1855, it was a penal settlement for convicts sent from New South Wales. In 1856 many of the inhabitants of Pitcairn Island (q.v.) were transferred hither by the British government. The people are indolent and owing to intermarriage, a decaying race; they fish, farm and supply provisions to passing vessels. Formerly under New South Wales, the island was in 1914 placed under the government of the Australian commonwealth. It is a station of the British All-Red cable. Pop. 985.

NORFOLK ISLAND PINE. See ARAUCARIA.

NORFOLK SPANIEL. See SPANIEL.

NORFOLK AND WESTERN RAILWAY COMPANY, a company incorporated 24 Sept. 1896 under the laws of Virginia, as successor to the Norfolk and Western Railroad. Additional lines were acquired from time to time, including the Cincinnati, Portsmouth and Virginia Railroad, and a half-interest in the Winston-Salem Southbound Railroad (the other half being owned by the Atlantic Coast Line Railroad). The company also controls the Pocahontas Coal and Coke Company. The Pennsylvania Railroad Company and its subsidiary companies own \$11,320,000 preferred and \$41,975,900 common stock of the Norfolk and Western, or about 38 per cent of the total capital stock.

On 31 Dec. 1917 the directly operated lines of the company consisted of 2,086.45 miles, including 1,542.98 miles of main lines owned, 529.49 miles of branches owned, and 13.98 miles

of traffic rights. The main line runs from Norfolk, through the West Virginia soft-coal fields to Cincinnati, Ohio, and Columbus, Ohio, with lines to Richmond, Va., Hagerstown, Md., Winston-Salem, N. C., Durham, N. C., and Bristol, Tenn. Most of its mileage, however, lies in the State of Virginia and West Virginia. For the year ended 31 Dec. 1917 its total operating revenues amounted to \$65,910,242; total operating expenses, \$41,161,503; total operating income \$19,651,816; total other income, \$3,530,239; gross income, \$23,182,055; net income, \$18,946,137; surplus for year, \$8,393,840; leaving the percentage earned on common stock outstanding at end of year at 14.96 per cent. On 31 Dec. 1917 the equipment included 431 passenger cars, 41,908 freight cars of all kinds, 10 barges, 241 side dump cars, 41 derrick tool cars, and 1,180 maintenance, wrecking cars, etc. On 27 Dec. 1917 the complete operation of this railroad property was taken over by the United States government and the road in 1918-19 was operated by the Director-General of Railroads.

NORIA, a hydraulic machine used in Spain, Syria, Egypt and other countries for raising water. It consists of a water-wheel with revolving buckets or earthen pitchers, but its modes of construction and operation are various. As used in Egypt it is known as the *sakieh*. These machines are generally worked by animal power, though in some countries they are driven by the current of a stream.

NORIAN, *nō-rē-āk*, **Jules**, pseudonym of Claude Antoine Jules Cairon: b. Limoges, France, 1827; d. Paris, France, 1 Oct. 1882. His novels won a high reputation and among the most widely known are 'The Countess of Bruges' (1878); 'The Chevalier de Cerny' (1879), etc.

NORM, a standard of reference in accordance with which an entity or state of affairs is approved or disapproved. Our standards of right and wrong, truth and falsity, beauty and ugliness, pleasure and pain, are all norms, and the sciences which concern themselves with applying these standards — namely, ethics, logic, aesthetics and what may be called *hedonics* — are classed as normative sciences. Not every criterion is a norm; an act of approval or disapproval must depend on the application of the criterion. Thus, when one is weighing in an experiment the electrolytic deposit on a piece of metal, he is not applying a norm, but when he weighs a purchase to determine whether it is less in weight than it should be, he is applying a norm, as in this latter case the discovery of a deficiency in weight is the object of disapproval. This approval or disapproval seems on introspection to be the same in nature throughout all the different norms with which it is associated, and to be insusceptible to any obvious analysis. The distinction between the several normative sciences, or sciences which are concerned in evaluation according to norms, resides not in any distinction between the sorts of approval involved in each, but to the object of that approval and to the scope of the consciousness in which it is approved. A normative judgment is ethical when the range of consciousness has been enlarged to the greatest possible extent, and an attempt has been made to consider every relevant antecedent, concomitant and conse-

quent circumstance. It is aesthetic when the range of consciousness is restricted to what lies within the object of evaluation, but embraces every possible detail within the limits of this restriction. It is logical when the content of the mind consists entirely of propositions which, by disregard of their peculiar matter, have been reduced to mere schemata. It is hedonic when the existing state of consciousness is taken as it is found, with no attempt to broaden or deepen its scope. See *ÆSTHETICS*; *ETHICS*; *LOGIC*.

NORMA. Italian opera in two acts, by Bellini, first performance at La Scala, Milan, by Pasta, Grisi and Donzelli, 26 Dec. 1831. London first heard the work at King's Theatre, 20 June 1833; Paris at the Italiens, 8 Dec. 1835; and New York, at Niblo's, 30 Sept. 1843, Corsini and Perozzi singing Norma and Pollione. The New York Academy of Music, Irving Place, was opened with Norma, sung by Grisi and Mario, 2 Oct. 1854. Romani's libretto of Norma was taken from Soumet's tragedy of the same name, produced at the Théâtre Français, 6 April 1831, about a year before Norma was heard at La Scala. The successful opera killed the play. The scene is laid among the Druids in Gaul during the occupation by the Roman legions. The first and most celebrated representative of the Druid priestess was Pasta. Norma became one of Grisi's most famous parts. It was also splendidly sung by Malibran, Titiens and Lilli Lehmann. Rubini and Mario were famous in the part of Pollione. The prayer "Casta Diva," sung by the Druid priestess, after she cuts the sacred mistletoe, is one of Bellini's most popular melodies and exhibits his marvelous skill with ornate embellishment. His air has lately been revived and sung in concerts by Alma Gluck. Consult 'Omaggio à Bellini nel primo centenario della sua nascita' (Catania 1901); Lloyd, William A., 'Vincenzo Bellini' (London 1916); Upton, 'Standard Operas' (Chicago 1890).

NORMAL, *nôr-mal*, Ill., city in McLean County, at the junction of the Chicago and Alton and the Illinois Central railroads, about 60 miles northeast of Springfield. It was settled about 1840. It is in a productive agricultural region in which considerable attention is given to the cultivation of fruit and nursery stock and to the raising of Norman and French draft horses. It has canning factories, novelty works and a large trade in farm products, nursery stock and horses. It is the seat of the Illinois State Normal University and the Illinois Soldiers' Orphans' Home. Pop. (1920) 5,143.

NORMAL COLLEGE (now **HUNTER COLLEGE**) OF THE CITY OF NEW YORK, founded in 1869, for the training of teachers. The first attempt in New York City to provide public means for teachers to procure professional training was in 1856, when a daily normal school was established, which remained in existence only three years. This was followed by the Saturday Normal School, which proved a source of inspiration to the teachers, and made them strong advocates for more thorough professional work. In 1869 the Normal and High School for young women was established by the board of education; in 1870 the name was changed to Normal College. Graduates of grammar grades were then admitted and the course was for three years. The

first president was Thomas Hunter. The entrance requirements and the course of study have been raised, and now the institution has a four-year course of academic work, based on a four-year course in the city high schools. The degree of A.B. is conferred. It has in addition a model kindergarten and a model elementary school, a model high school, an excellent library and well-equipped laboratories. A large number of the teachers in New York City are graduates of this college. The teaching staff at present numbers 130 and the students 1,450; the high school department has 70 teachers and 1,100 pupils, the model elementary school 22 teachers and 750 pupils, and the kindergarten five teachers and 100 pupils. In 1914 the name was changed to Hunter College in honor of the first president, Thomas Hunter. None but residents of New York City are eligible for admission. The board of trustees consists of the president of the college and the members of the New York board of education.

NORMAL SCHOOLS. See **TEACHERS**, PROFESSIONAL TRAINING OF.

NORMAN, nôr'man, **SIR Henry**, English traveler and author: b. Leicester, England, 19 Sept. 1858. He was graduated from Harvard in 1881 and later studied at Leipzig. In 1882 he began a public agitation for the preservation of Niagara Falls, which resulted in the purchase of land on both sides of the falls by the State of New York and the Dominion of Canada for use as a public park. He was for several years on the editorial staff of the *Pall Mall Gazette* and later of the London *Daily Chronicle*, and retired from journalism in 1910. He traveled widely in the United States and Canada and also in Japan, Russia, Siberia, central Asia, Korea, China, Siam, the Malay Peninsula, Egypt and the Balkans. In 1902 he founded the 'World's Work,' an illustrated monthly which he also for some time edited. From 1900 to 1910 he represented (in the Liberal interest) South Wolverhampton in the House of Commons and after the latter date Blackburn. He was chairman of the War Office Committee on Wireless Telegraphy in 1912; and after the outbreak of the Great War was a member of the Inventions Panel of the Ministry of Munitions. He was knighted in 1906 and created a baronet in 1915. He has written 'An Account of the Harvard Greek Play' (1881); 'The Preservation of Niagara Falls' (1882); 'The Real Japan' (1892); 'The Peoples and Politics of the Far East' (1895); 'The Near East' (1899); 'All the Russias' (1902), and 'Delhi' (1902).

NORMAN, Okla., city, county-seat of Cleveland County, on the Atchison, Topeka and Santa Fé Railroad, about 48 miles south of Guthrie and 20 miles south of Oklahoma. It is an agricultural region in which the cultivation of wheat and cotton and cattle-raising are the chief occupations. The principal manufactures are flour, cottonseed oil and ice. It has considerable trade in wheat, flour, cotton, cottonseed oil and livestock. It is the seat of the University of Oklahoma (q.v.) and of the State Insane Asylum. There are several churches, public schools and banks. The government is vested in a mayor and a board of aldermen of eight members. The city owns its water-supply system. Pop. (1920) 5,004.

NORMAN ARCHITECTURE, a variety of the Romanesque style originated by the Normans and introduced into England by William the Conqueror. Within the generation of their conquest of the district known to-day as Normandy they began to erect churches and cathedrals in memory of their victories. Their conquests supplied them with the means for making these large edifices. Not content with the small churches then common in France, they desired monuments worthy of their great conquests. While retaining the general style of the French churches the Normans erected much larger buildings. They borrowed also to a limited extent from the early Gothic. Size and massiveness characterize the early period when the Latin plan (derived from the Basilica) of a central portion with aisles at the sides, and with a semi-circular apse at the east end is followed. The tower was a favorite and in Norman hands became highly developed. Ornamentation consisted of the billet, chevron, zigzag, etc., but remained of a simple design. Semi-circular arches crowned doors and windows. At first single pillars supported the nave arches, but in later examples shafted piers are found. The main central part of the structures at first were without vaults because of the great width, and wooden roofs were substituted, with vaults on the side aisles only. The masonry of the early period is rude, with large joints, and the stones generally unhewn. The style prevailed from about the beginning of the 10th century until the death of William the Conqueror, near the close of the 11th century. Normandy has many fine extant examples, among which perhaps the best known are the churches of Caen erected in the time of the Conqueror. This style of architecture was brought into England by the Normans at the Conquest in 1066. They there extended the scale of the buildings, as they had done in Normandy, preserving, however, many local peculiarities of the Saxon style, which they found in the country. An example of pure Norman is the White Tower chapel of the Tower of London. There are, however, many buildings, both in England and in Scotland, which date from before the end of the 12th century, when the pointed style began to be used. Durham, Lindisfarne, Canterbury, Dunfermline are partially Norman, besides many other churches and castles. The Anglo-Norman is heavier than the French-Norman, the cylindrical nave piers of the above-named buildings being much more massive than those of French works. To relieve this heaviness, the chevron, spiral and other groovings were cut in the piers. The moldings and forms of doors, windows, etc., are the same as those of Normandy. There is one remarkable difference in the plans of the early Norman churches in the two countries: in France, the apse at the east end is always semi-circular; in England, this form was gradually given up; and toward the last the square east end was universally adopted. Consult Browne, E. A., 'Norman Architecture' (New York 1907); Dehio and Bezold, 'Kirchliche Baukunst des Abendlandes' (Stuttgart 1892), and Ruprich-Robert, V. M. C., 'L'Architecture normande' (2 vols., Paris 1884-90).

NORMAN CONQUEST, in English history, the successful attempt made by William

of Normandy in 1066 to secure the English crown from his rival Harold, son of Earl Godwin. It was no real conquest of the land and people by an alien race, but rather resembled in its chief characteristics the accession of William of Orange to the throne in 1688. Any immediate evil effects were more than counterbalanced by the advantages which it conferred on England, such as the grafting on Anglo-Saxon institutions of the better organization and greater mastery of law of the Normans; the bringing of England more into touch with European politics and the consequent beginning of her ever-widening foreign relations; the repression of internecine strife and the greater security of life and property; the great impetus given to architecture and to many of the industrial arts, and finally its great influence on the development of the old English language into modern English. See GREAT BRITAIN — THE CONQUESTS.

NORMAN FRENCH, the language spoken by the Normans at the time of the Conquest. Its development in England was largely, if not altogether, independent of foreign influences, and latterly varied from every form of French, and even from the dialect of Normandy, with which it had at the outset coincided. It ceased to be a spoken language after 1400. It was the legal language of England till the reign of Edward III, and certain law phrases and legal words have been incorporated into English. It exercised a considerable influence on the Anglo-Saxon, and is still spoken among the native population of the Channel Islands (q.v.), the remnant of the Norman possessions belonging to Great Britain. See NORMANDY.

NORMAN LAW. See LAW; NORMANDY.

NORMANBY, nôr'man-bî, **Constantine Henry Phipps**, 1st MARQUIS of, English statesman: b. England, 15 May 1797; d. South Kensington, England, 28 July 1863. He was educated at Trinity College, Cambridge, and in 1818 entered Parliament, sitting for Scarborough in the liberal interest. In 1832 he was appointed captain-general and governor of Jamaica and in 1835 was made lord-lieutenant of Ireland, where he was extremely popular. He was Secretary for War and the Colonies in 1839 and later was transferred to the Home Secretaryship which he occupied until 1841. He was Ambassador to France 1846-52 and to Florence 1854-58. He wrote 'The English in Italy' (1825); 'A Year of Revolution' (1857); 'Vindication of the Duke of Modena' (1861), and several novels, one of which was 'The Contrast' (1832).

NORMAND, nôr'mand, **Henrietta Rae**, English painter: b. London, 30 Dec. 1859, daughter of T. B. Rae; married Ernest Normand, painter, 1884. She was educated in London art schools and was awarded a medal at the Paris and Chicago Universal Expositions. Since 1880, when she first exhibited at the Royal Academy, she has been represented there every season. Some of her most important pictures are 'Ariadne' (1885); 'A Naiad'; 'Eurydice'; 'Death of Procris'; 'Ophelia'; 'Apollo and Daphne'; 'Diana and Calisto'; 'Sir Richard Whittington and his Charities,' a fresco for the Royal Exchange; 'In Listening Mood'; 'Hylas and the Water-Nymphs'; 'Spring's Awakening,' and portraits of the

Marquess of Dufferin and Sir Alfred J. Newton.

NORMAND, nôr'mân, **Jacques Etienne**, French communist: b. Abbeville, France, 1809; d. San Antonio, Tex., 1867. He was a Saint Simonist, and during the Revolution of 1848 in France petitioned the legislature for permission to establish a communistic colony; he was banished from France when Louis Napoleon became President and came to the United States. Buying considerable land near San Antonio, Tex., he established a communistic colony called Réunion, which prospered for a time, but which was finally suppressed by the Texas legislature. While trying to establish another colony he was arrested and imprisoned. He wrote 'Principes de socialisme' (1846); 'Théorie de la Commune Naturelle' (1855); 'Théorie de la République Communiste Universelle' (1860).

NORMANDY, nôr'man-dî, France, an ancient province bordering on the English Channel, now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados and La Manche. It is a fertile region, with well-cultivated fields and fruitful orchards and the people are intelligent and industrious, ranking among the best and most energetic of French provincials. Under the Romans this portion of the country formed part of *Gallia Lugdunensis Secunda*; after the Frankish invasion it was a constituent part of the kingdom of Neustria, and was given by Charles the Bald to the Duke of Paris. From the middle of the 9th century its coasts were harried by the vikings or Northmen (see NORMANS), who early in the 10th century established themselves in such force along the Seine that Charles, king of the Western Kingdom, was glad to arrange a treaty with their leader, Rolf (Rollo, Rou), at Clair-sur-Epte in 912, practically ceding the region, which henceforth was known as Normandy. Its capital was Rouen, and it comprised Upper Normandy, with the towns of Dieppe, Evreux, Harfleur, Havre, Honfleur, Lisieux, Rouen and Yvetot, and Lower Normandy with Caen the chief town, Alençon, Avranches, Bayeux, Cherbourg, Constances, Falaise, Granville and Saint Lô. Rollo's most distinguished successor was William I, Duke of Normandy, who invaded England in 1066, and as William I established a Norman dynasty, thereby uniting Normandy with the latter country. Philip Augustus conquered Normandy in 1204, the French holding it till 1417, when it was recovered by the English, who held it till 1450, when it was finally wrested from them by Charles VII. The Channel Islands (q.v.) are a remnant of the Norman possessions still belonging to the descendants of the Norman kings of England, where down to the present day the law administered in the royal courts is virtually the *Grand Coutumier de Normandie*, or the old customary law of Normandy. One feature survives in the Cry of Haro. This ancient customary law of Normandy seems to have been collected in writing on three separate occasions. The earliest collection was apparently written down by private persons in 1200 and about 1220 and had no official character; the third collection (1585) is a revised edition of the second, the *Grand Coutumier*, completed early in the 14th century. Consult Freeman, 'Norman Conquest'

(1877); Haskins, 'Normandy and William the Conqueror' (1909); Palgrave, 'History of Normandy' (1878); Powicke, 'The Loss of Normandy, 1189-1204' (1913); Prentout, 'Essai sur les origines de la fondation du duché de Normandie' (1911); Spence, 'Dreamland in History' (1890).

NORMANS, or NORTHMEN, a general name given the people of ancient Scandinavia or Norway, Sweden and Denmark. This name was given to them in the Netherlands, in Germany and France: in Great Britain they were called Danes. They were fierce and warlike tribes, who made piratical expeditions to all parts of the European seas, plundering by land and by sea, and often overrunning large tracts of country, in which they practised every enormity. "They had scarcely any inducements," says Mackintosh, the English historian. "to spare countries which they visited only to plunder, and where they did not hope to dwell; they were less than others liable to retaliation, and they had neither kindred nor family nor home. They were, perhaps, the only barbarians who applied the highest title of magistracy to denote the leaders of piratical squadrons, whom they termed *vikingr* or *sea-kings*. Not contented with their native and habitual ferocity, some of them sought to surpass their companions by working themselves into horrible and temporary insanity." *Vikingr* does not, however, mean sea-kings, but is derived from *vik*, a bay or creek. The poverty of their country compelled them to adopt this means of subsistence, and their religion inspired them with a love for daring enterprises, since it taught them that warriors fallen in battle were admitted to Valhalla, the northern paradise.

In 795 some Norwegians established themselves in the Farøe Isles and in Orkney; toward the middle of the 9th century they founded the governments of Novgorod and of Kiev, in Russia; and after the discovery of Iceland certain powerful Norwegian families, taking refuge from the persecutions of Harold, king of Denmark, settled in that island. The Northmen began their piratical excursions in the first part of the 9th century, and soon covered the sea with their boats, and ravaged the coasts of England, Germany, Friesland, Flanders and France. Under the feeble reigns of Charles the Bald and Charles the Fat they ascended the rivers to the very heart of France and plundered Paris itself. It became necessary to purchase their retreat with gold. Their incursions into France were afterward renewed and Charles the Simple was obliged (912) to cede to them a part of Neustria, which was afterward called, from them, *Normandy* (q.v.), and to give his daughter in marriage to Rollo, their chief. Rollo embraced the Christian religion, was baptized under the name of Robert and became the first Duke of Normandy and a vassal of the king of France. His followers received the religion of their leader and abandoned their roving and piratical habits: though they still retained, as also did their descendants for a long time, marks of their Scandinavian origin and that warlike ardor which had rendered them so terrible to those against whom they directed their attacks. Great Britain was, for about two centuries, desolated by the Danes, as the Northmen were there called. Egbert, in the beginning of the 9th century, had no sooner

made some approaches toward a regular government and the establishment of tranquillity, than the "Scandinavian heathens," as the Saxons termed them, made their appearance. Alfred (871-901) finally delivered the country from the invaders, after they had subdued the whole land except the "isle of the nobles," into which the king had retreated with a few nobles. But the relief was only temporary: they returned, under his successors, in greater force, obtained possession of the northern and eastern part of the country, and in the beginning of the 11th century three Scandinavian princes (Canute, Harold and Hardicanute) ruled over all England for the space of about 25 years. The Saxon line was then restored; but in 1066 William, Duke of Normandy, obtained the English throne. This conquest, as it is commonly called, had a most important influence on the Saxon manners, language and constitution, which had hitherto escaped with little change, and is, therefore, one of the most important epochs in the English history. In the year 1000, according to the Saga narratives, Leif, son of Eric the Red, leaving Greenland, which had been discovered and settled by his father, a Norwegian, proceeded southward in a ship, accompanied by 35 men, and discovered the American coast, to which he gave the name of Vinland. In 1007 a rich Greenlander, with a following of 60, emigrated to Vinland, and there planted a colony, which seems to have thriven, but after a time we hear nothing more about it. The Normans also established a new kingdom in Naples in 1016. The foreign expeditions of the Northmen gradually diminished their numbers and strength at home, and rendered them less formidable.

Consult Depping, 'Histoire des expéditions maritimes des Normands' (1826); Du Chaillu, 'The Viking Age' (1890); Fischer, 'Discoveries of the Norsemen in America' (Eng. tr. 1903); Freeman, 'History of the Norman Conquest of England' (1877); Hov-gaard, 'The Voyages of Norsemen to America' (1914); Keary, 'Vikings in Western Christendom' (1891).

NORNS, *nórnz*, in Scandinavian mythology, the three Fates, representing the past, the present and the future, whose decrees were irrevocable. They were represented as three young women, named respectively Urd, Verdandi and Skuld. They sit by the well of Urd, under the world-tree Yggdrasil in Asgard, and there determine the fate of both gods and men. Besides these three there are many inferior norns, both good and bad, answering to the genii of classical mythology; to such are attributable the unequal destinies of men in the world. Women who possessed the power of prediction or magic also bore this name.

NORQUAY, John, Canadian statesman: b. near Fort, Gerry, Manitoba, 8 May 1841; d. Winnipeg, 5 July 1889. He was of mixed Scotch and Indian parentage and was educated at Saint John's Academy, Red River Settlement. During the negotiations after the Red River Rebellion he secured the confidence of both the authorities and the half-breeds in 1869, and on the formation of the government was elected to the first Manitoba Parliament in 1870. In 1871 he was appointed Minister of Public Works and Agriculture, to which he was

again appointed in 1876, having in the meantime resigned and joined the Davis administration (1875). In 1878 he formed a ministry and became Premier and Colonial Treasurer. From 1874 until his death he sat in the legislature. He was Premier of Manitoba from 1878 to 1887, when he resigned. Norquay promoted legislation on municipalities, drainage and county courts; upheld the rights of his native province and initiated the struggle for enlarged boundaries; finally granted in 1912. On several occasions he represented the province to the federal government at Ottawa. He also contended successfully against the monopoly in railway construction conferred upon the Canadian Pacific. Consult Begg, Alexander, 'History of the Northwest' (Toronto 1894). His portrait appears in *Canadian Magazine* (July 1903).

NORRIDGEWOCK INDIANS, an American tribe of the Algonquin family and the leaders in the Abnaki confederacy. They formerly lived along the Kennebec River in Maine and were frequently called Kennebec Indians. They were patrons of the French missionaries, who first ministered to them in 1688, and were regarded as dangerous enemies of the English colonists. The latter sent an expedition against the Norridgewocks in 1724, when the Indians were defeated, the resident priest, Father Rasle, killed, and the tribe dispersed, some going to the Penobscot and Passamaquoddy and others to Saint Francis, in Canada. Those who returned to their old home were dispersed for a second time in 1754 and made their way to Canada.

NORRIS, nôr'is, Edwin, English linguist: b. Taunton, Somerset, England, 24 Oct. 1795; d. Brompton, England, 10 Dec. 1872. His early youth was spent in tutoring, and in 1818-37 he was a clerk with the East India Company. In 1837 he became assistant secretary of the Royal Asiatic Society and in 1859 its secretary. His time was principally devoted to the study of the Semitic languages and the Celtic dialect and he was an authority on cuneiform writing. His greatest work is his 'Assyrian Dictionary' (1868-72).

NORRIS, Frank, American novelist and journalist: b. Chicago, 5 March 1870; d. San Francisco, 25 Oct. 1902. He studied at the University of California and at Harvard, after three years as an art student in Paris; was correspondent of the *San Francisco Chronicle* in South Africa in 1895-96; edited the *San Francisco Wave* 1896-97; wrote articles from Cuba for *McClure's* in 1898, and was the author of several virile realistic novels: 'McTeague' (1899), in illustration of slum life in San Francisco; 'Moran of the Lady Letty,' a romantic story (1900); 'The Octopus,' a story of wheat raising and the transportation trusts (1901), and 'The Pit,' dealing with wheat exchange and gambling. The two last named stories are epical and Zolaesque in manner, and were to have been concluded by 'The Wolf,' a story of European famine.

NORRIS, George Washington, American lawyer and financier: b. San Francisco, Cal., 5 July 1864. He was educated at the University of Pennsylvania, was engaged in the practice of law in Philadelphia from 1886 to 1894 and from 1894 to 1911 was a member of the banking firm

of Edward B. Smith and Company. From 1911 to 1915 he was director of the department of wharves, docks and ferries of Philadelphia; in 1916 served as vice-chairman of the Federal Reserve Bank of Philadelphia. On 6 Aug. 1916 President Wilson appointed Mr. Norris member of the Federal Farm Loan Board, of which he is active executive officer. Mr. Norris is trustee of the Philadelphia Bureau of Municipal Research and of many social societies.

NORRIS, George William, American statesman: b. Sandusky County, Ohio, 11 July 1861. He was born on a farm and spent his early years farming in the summer and attending schools in the winter, receiving most of his early education at Baldwin University, Ohio. He was graduated at the Indiana Normal College in 1881. He studied law and was admitted to the bar of Ohio in 1883, but removed to Nebraska in 1885. Here he was elected as a Republican and re-elected prosecuting attorney of Furnas County for three terms from 1895 to 1903, and from 1895 to 1902 he was judge of the 14th Nebraska district. He was elected to the 58th United States Congress in 1903 and served continuously until 1913, when he became United States senator (Republican) from Nebraska. He was a member of important committees and in March 1910 was not only one of the 35 congressmen who struggled to overthrow Speaker Cannon, but a leader in the fight. He introduced a resolution providing for the election of a committee by the House and for the elimination from it of the speaker; but when the resolution was adopted by means of a coalition with the Democrats, Norris refused to vote for the deposition of Cannon. In 1912 he declined to join the Progressives.

NORRIS, Kathleen, American author: b. San Francisco, 16 July 1880. Her maiden name was Thompson and she was educated by her parents and by private teachers and took a special course at the University of California. In 1909 she was married to Charles Gilman Norris, also a writer. She began to write short stories which appeared in the *Atlantic*, *McClure's*, *Everybody's*, the *Ladies' Home Journal*, etc., and developed into a novelist. Her books are 'Mother' (1911); 'The Rich Mrs. Burgoyne'; 'Poor Dear Margaret Kirby'; 'The Treasure' (1914); 'Saturday's Child' (1914); 'The Story of Julia Page' (1915); 'The Heart of Rachael' (1916); 'Martie, the Unconquered'; and 'Undertow' (1917).

NORRIS, Mary Harriott, American novelist: b. Boonton, N. J., 16 March 1848; d. 14 Sept. 1919. She was graduated from Vassar College in 1870, was principal of a private school in New York 1890-96, and dean of the woman's department of Northwestern University, Evanston, Ill., 1898-99. Among her published books are 'A Damsel of the 18th Century' (1889); 'The Gray House of the Quarries' (1898); 'The Grapes of Wrath' (1901); 'The Story of Christina' (1907); 'The Veil' (1908); 'The Golden Age of Vassar' (1915).

NORRIS, Tobias Crawford, Canadian statesman: b. Brampton, Ontario, in 1861. In his youth he moved to Manitoba and became a farmer and an auctioneer of livestock. Entering municipal politics, he soon advanced and was elected as a Liberal for Lansdowne in the Manitoba legislature, where he served for seven

years. He was returned in 1907 and in 1909 elected leader of the Liberal opposition. In May 1915 he became Premier of Manitoba.

NORRIS, William Edward, English novelist: b. London, England, 18 Nov. 1847. He was the son of a former chief justice of Ceylon, was educated at Eton and admitted to the bar in 1874 but never practised. His first novel, 'Heaps of Money,' appeared in 1877, and was successful. It was succeeded by 'Mademoiselle de Mersac' (1879); 'Matrimony' (1881); 'No New Thing' (1882); 'His Grace' (1892); 'A Deplorable Affair' (1893); 'A Victim of Good Luck'; 'Billy Bellew'; 'A Dancer in Yellow' (1896); 'Clarissa Furiosa' (1897); 'Marietta's Marriage'; 'The Widower' (1897); 'Giles Ingilby' (1899); 'An Octave' (1900); 'Lord Leonard the Luckless' (1903); 'An Embarrassing Orphan' (1904); 'Barham of Beltana' (1905); 'Pauline' (1908); 'Not Guilty' (1910); 'The Rt. Hon. Gentleman' (1913); 'Barbara and Company' (1914), all of which have enjoyed popularity. He has shown not a little skill in character drawing and his dialogue is entertaining and natural.

NORRISTOWN, Pa., borough, county-seat of Montgomery County, on the Schuylkill River, the Schuylkill Canal and on the Philadelphia and Reading and the Pennsylvania and Stony Creek railroads, about 15 miles northwest of Philadelphia. It was settled about 1688 by a colony from Wales, laid out in 1785, and incorporated as a borough in 1812. It was named in honor of Isaac Norris, who owned a large tract of land in what is now Montgomery County. It is in an agricultural and mining section of the State and has extensive manufacturing interests. The chief manufactures are knitting machines, hosiery, men's underwear, glass, iron, wire, screws, tacks, boilers, bolts, silos, rugs, paper boxes, machine-shop products, agricultural implements, iron and wood furniture. It has considerable trade in manufactured articles and farm products. Granite, limestone and marble are mined nearby. Some of the prominent buildings are county courthouse, city buildings, Masonic Temple and the county prison. It has a State Hospital for the Insane, Charity Hospital, Saint Joseph's Protectors (Roman Catholic) for girls, Friend's Home and the Agnes Stinson Home for Aged Ladies. The educational institutions are a high school, public and parish schools, the Montgomery Historical Society and the McCann Library. The tomb of Winfield Scott Hancock (q.v.) is here in Montgomery Cemetery, also a memorial shaft to John F. Hartranft. Valley Forge (q.v.) is only six miles west by north and many other places of historic and scenic interest are in the vicinity. The government is vested in a burgess, who holds office three years, and a council. The electric-lighting plant is owned by the municipality. Pop. 32,319. Consult Heysham, Theodore, 'Norristown, 1812-1912' (Norristown 1913).

NORRKÖPING, nór'hé-píng, Sweden, seaport, on the southeast coast, on the Bravik River, about 80 miles southwest of Stockholm. It was founded in 1384, but it has several times been destroyed by fire. The Motala, a rapid river, flows through the city and furnishes extensive water power which is used for manufac-

turing. It is an important commercial city and has docks, shipbuilding yards, an extensive trade in its manufactures of cotton and woolen goods, carpets, sugar, paper, beer, etc., and in the imports which are reshipped at Norrköping for the interior. Pop. 45,416.

NORRLAND, nór'lánd, Sweden, the largest of the three historical divisions of Sweden, in the northern part; area, 80,785 square miles. It has a cold climate, well-wooded in the south, scanty vegetation in the north. The towns and villages are chiefly in the southern part; but few settlements are in the northern part. Pop. 963,397. See SWEDEN.

NORSE, the language of Scandinavia, especially in its earliest forms. Old Norse is represented by the classical Icelandic and still with wonderful purity by modern Iceland. See ICELANDIC LANGUAGE; ICELANDIC LITERATURE; DANISH LANGUAGE; DANISH LITERATURE; NORWEGIAN LANGUAGE; NORWEGIAN LITERATURE; SWEDISH LANGUAGE; SWEDISH LITERATURE.

NORSE MYTHOLOGY. See SCANDINAVIAN MYTHOLOGY.

NORSEMAN, or **NORTHMEN**. See NORMANS.

NORTH, Christopher, the pseudonym of one of the authors of the 'Noctes Ambrosianæ.' See WILSON, JOHN.

NORTH, Sir Dudley, English financier and economist; 3d son of the 4th Lord North: b. Westminster, 16 May 1641; d. Covent Garden, 31 Dec. 1691. He early entered the employ of a merchant; became a leading merchant in and treasurer of the Turkey Company; resided for many years in Constantinople and returned to England in 1680; was one of the sheriffs of London in 1682 and a commissioner of customs in 1683, and retired from public life shortly after the accession of William and Mary. He was a man of great ability, one of the first Englishmen to urge the doctrine of free-trade and the author of an important pamphlet on the 'Currency.'

NORTH, Elisha, American physician: b. Goshen, Conn., 8 Jan. 1771; d. New London, Conn., 29 Dec. 1843. His father and grandfather were physicians and he early determined to follow their profession. Studying medicine in Harvard under Lemuel Hopkins and in Philadelphia under Benjamin Rush, he practised in Goshen until 1812, when he removed to New London. Here he practised until his death. Dr. North kept abreast of the times and was always foremost in adopting new ideas. He was among the first to practise vaccination in the United States, and sent a newly vaccinated patient to Dr. Edward Miller in New York for the purpose of supplying vaccine from the pustule. Dr. North paid special attention to the diseases of the eye and established the first eye infirmary in the United States at New London in 1817. When the new and obscure disease called spotted fever appeared in New England and raged from 1806 to 1810 Dr. North coped successfully with it. His 'Treatise on a Malignant Epidemic commonly called Spotted Fever' (New York 1811), received general approbation. His other works are 'Outlines of the Science of Life' (1829), and 'Uncle Toby's Pilgrim's Progress

in Phrenology' (New London 1836). Consult Bolton, H. Carrington, 'Life and Writings of Elisha North' (printed privately 1887).

NORTH, Francis, 1st BARON GUILFORD, English lord chancellor, brother of Dudley and Roger North (qq.v.): b. Kirtling, Cambridge-shire, October 1637; d. Wroxton, Oxfordshire, 5 Sept. 1685. He was educated at Cambridge and studied law at the Middle Temple. His rise was rapid: in 1671 he was knighted; in 1673 he was returned to Parliament and became Attorney-General, and from 1675 to 1682 was chief justice of the Court of Common Pleas. In 1682 he became lord keeper and presided at the trial of the Popish plot conspirators and stained his reputation by his partisanship in the trial and execution of Stephen College, the Protestant joiner. He was created Baron Guilford in 1683 and died soon after assisting at the coronation of James II. His uncompromising royalism made him the object of contemporary attack and present misunderstanding, notably in Lord Campbell's 'Lives of the Lord Chancellors.' It is to an early attack of this nature, namely, that in Kennett's 'Complete History' that we owe Roger North's 'Apology' for his brother, which grew into the 'Lives of the Norths.' The conflict of testimony makes his personal character problematical, but it is certain that he was a learned lawyer and a patron of literature, the art and the sciences.

NORTH, Frank Mason, American Methodist Episcopal clergyman: b. New York City, 3 Dec. 1850. He was graduated from the Wesleyan University in 1872 and ordained a Methodist clergyman; became pastor of a church in Florida, N. Y., in 1873-74. He then had the following charges: Amenia, 1874-76; Cold Spring on the Hudson, 1876-78; New York City, 1879-81; White Plains, N. Y., 1882-84; Calvary Church, New York, 1884-87, and Middletown, Conn., 1887-92. He was corresponding secretary of the New York City Church Extension and Missionary Society from 1892 to 1912. In 1912 the General Conference elected him one of the three corresponding secretaries of the board of foreign missions, which he still holds. He was also corresponding secretary of the Methodist National City Evangelization Union (1896-1912) and chairman of the executive committee of the Federal Council of Churches in America. In 1914 he traveled in the Orient to visit the missions. From 1892 to 1912 he was editor of the *Christian City*. Wesleyan gave him the degree of A.M. in 1875 and D.D. in 1894.

NORTH, Frederick, LORD, 2ND EARL OF GUILFORD (better known as Lord North), English statesman, George III's Prime Minister during the American Revolution: b. London, 13 April 1732; d. there, 5 Aug. 1792. His father was Francis, 1st Earl of Guilford. He was educated at Eton and Oxford; studied and traveled abroad for three years; and in April 1754 was elected to the House of Commons for one of his father's pocket-boroughs. From June 1759 to July 1766 he was a junior lord of the treasury; and in 1767 became Chancellor of the Exchequer and leader of the House of Commons upon the death of Townshend, whose measures taxing the American colonies Lord North carried through, and in this particular, as in general

showed himself the 'king's friend' and entirely indifferent to the wishes of the people; indeed he prided himself that he had never voted for popular measures. Early in 1770 he became Prime Minister, but was none the less merely the king's tool; in March 1774 he succeeded in passing the celebrated Boston Port Bill and Massachusetts Bill; and though he seems to have seen soon after the king's policy was a mistaken one and could result only in the loss of the colonies, and although he urged in 1775 that the colonies, if they taxed themselves, should not be taxed by Parliament, he still supported the king's obstinate policy and remained in office, while his government grew steadily weaker because of the defection of men whose scruples, identical with his, carried force with them. On 20 March 1782 he resigned, just in time to forestall a motion for the dismissal of the cabinet. In February of the next year, by a dexterous coalition with his old enemy, Fox, he secured the dismissal of Shelburne, was a member of the coalition cabinet in 1783 and thereafter acted with the opposition against Pitt. The last five years of his life Lord North was blind, but still took some interest in politics, and spoke occasionally in the House of Lords, of which he became a member in 1790 upon his father's death. Personally he was clumsy, awkward, very short-sighted, with an unintelligent puffy face, expressionless eyes and heavy lips, closely resembling George III. As Prime Minister he was the king's agent and completely subservient to the obstinate king; indeed, he refused to be called Prime Minister, denying the place of any such office in the British Constitution. After his coalition with Fox he broke with the Crown, however, and refused George III's urgent offers to make him Premier in 1783. He was neither a great statesman nor a great orator, but had a gift of humor, wit and pleasant temper. Consult Donne, 'Correspondence of George III with Lord North' (1867); Lecky, 'History of England' (1882-87); Lewis, 'Administration of Great Britain' (1864); Lucas, Reginald, 'Lord North' (1913).

NORTH, Maranne, English flower painter and botanist: b. Hastings, England, 1830; d. Gloucestershire, England, 1890. She inherited her passionate love of flowers from her father, Frederick North, member of Parliament from Hastings, who retired from public life in 1865. He then traveled with this daughter, who had studied flower-painting under Valentine Bartholomew, visiting nearly every quarter of the globe and exploring the forests of Java, Borneo, India, Chile, North America and Australia, as well as those of Europe, in a search for new specimens. A fever contracted in Borneo was the ultimate cause of her death. Her water-colors, displaying much beauty, as well as scientific accuracy, were exhibited in London in 1879, and she presented her entire collection to the Botanical Gardens at Kew, adding the gift of a gallery in 1882, in which she arranged them herself with great taste. Students of botany owe much to her travels and skilful brush. Five botanical species have been named in her honor. Her autobiography, 'Recollections of a Happy Life,' was edited by her sister, Mrs. John Addington Symonds (2 vols., London 1893), who also published extracts from her diary, 'Further Recollections of a Happy Life'

(London 1893). Consult Hemsley, W. B., 'The Gallery of Marianne North's Paintings of Plants and their Homes,' Royal Garden's View, descriptive catalogue (London 1883).

NORTH, Roger, English colonist in America: b. about 1585; d. 1652. He was the son of Sir John North, and a grandson of Roger, 2d Baron North, and in 1617 accompanied Sir Walter Raleigh to Guiana, did good service against the Spaniards on the Orinoco and remained faithful to his commander to the last. In 1619 he applied for a patent to trade along the Amazon, and, when this was denied him because of Gondomar's influence with the king, he sailed from Plymouth without leave in May 1620, and was imprisoned upon his return. In 1627 he received letters patent to found Guiana, but spent the last years of his life in England. North planted the English power in South America, and was one of the most notable colonial projectors of his day.

NORTH, Roger, English lawyer and historian, brother of Dudley North and Francis North (qq.v.): b. Tostock, Suffolk, 3 Sept. 1653; d. Rougham, Norfolk, 1 March 1734. He studied at Jesus College, Cambridge; became a barrister at the Middle Temple; rose rapidly in the practice of law, becoming Attorney-General to the queen in 1686. He entered Parliament in 1685, and voted against the court party on the question of the dispensing power. As he was a staunch nonjuror, he left political life upon the accession of William and Mary; and spent the rest of his life in retirement. He was a famous book-collector, but is best known for his 'Lives of the Norths,' an invaluable picture of the life of the period, as is his 'Autobiography.' Both these books are included in Bohn's Library (1890). His strong Tory sentiments are to be seen in the 'Examen,' a critical inquiry into the truth of White Kennett's 'History of England.' North also wrote 'Memoires of Musick' (ed. by Rimbault in 1846).

NORTH, Simon Newton Dexter, American statistician: b. Clinton, N. Y., 29 Nov. 1849; d. Wilton, Conn., 3 Aug. 1924. He was graduated at Hamilton College in 1869; was editor of the *Utica Morning Herald* 1869-86. In that year he went to Albany as editor and part proprietor of the *Express*. He was appointed chief statistician for manufacturers of the twelfth census, and in 1903-09 director of the United States Census, in both of which positions he showed exceptional ability. In 1906 he held the chairmanship of the American Tariff Commission to Germany, and in 1910 he was elected president of the American Statistical Association. For 15 years (1888-1903) he was secretary of the National Association of Wool Manufacturers and editor of its *Quarterly Bulletin*. The degree of LL.D. was conferred upon him by Bowdoin in 1902 and the University of Illinois in 1904. His writings include 'History and Present Condition of the Newspaper and Periodical Press in the United States' (1884); 'A Century of American Wool Manufacture, 1790-1890' (1895); 'Old Greek—An Old-Time Professor in an Old-Fashioned College,' a memoir of his father, Dr. Edward North (1905); 'Simeon North—First Official Pistol Maker of the United States' (Concord 1913).

and many pamphlets and articles on economical, educational and industrial subjects.

NORTH, Sir Thomas, English translator of Plutarch, son of the 1st Baron North: b. about 1535; d. about 1601. He studied at Peterhouse, Cambridge; entered Lincoln's Inn 1557; and was knighted about 1591. He has been called 'the first great master of English prose.' In 1579 he published his version of Plutarch's 'Lives,' actually a version from the French of Amyot. It was dedicated to Queen Elizabeth, was very popular in her day and was the immediate source of most of Shakespeare's classical plays, notably 'Antony and Cleopatra,' 'Coriolanus,' 'Julius Cæsar' and 'Pericles,' some of which have entire speeches taken scarcely with a change from North. North also translated Guevara's 'Libro aureo,' a Spanish adaptation of the 'Meditations of Marcus Aurelius'; and a collection of Oriental fables from the Italian of Doni. Consult Skeat, 'Shakespeare's Plutarch' (1875); and Leo, 'Four Chapters of North's Plutarch' (1878). The complete version is to be found in the 'Temple Classics,' and in a splendid reprint in the 'Tudor Translations' (1895).

NORTH, William, American soldier: b. Fort Frederick, Pemaquid, Me., 1755; d. New York, 3 Jan. 1836. He entered the Revolutionary army in 1775 and served under Arnold in the Quebec expedition. In 1779 he was aide-de-camp to Baron Steuben, whom he greatly assisted and who at his death bequeathed to North a large part of his property. He was present at the surrender of Cornwallis and remained in the army after the war, rising to the rank of brigadier-general in 1798. He sat in the New York State assembly, of which he was twice speaker, and from 1789-99 was a United States senator. He was mustered out of service in 1800. He wrote a biography of Baron Steuben.

NORTH ADAMS, Mass., city in Berkshire County, on the Hoosac River and on the Boston and Maine and the Boston and Albany railroads, about 50 miles northwest of Springfield. It was settled in 1765 and was part of Adams until 1878 when it was incorporated as a town and in 1895 was chartered as a city. It includes the villages of Brayton, Greylock, Beaver and Blackington. It is situated in a beautiful section, amid the Berkshire Hills, at the base of Greylock, the highest peak in the State. In the western part of the city is the site of old Fort Massachusetts; captured in 1746 by French and Indians under command of Vaudreuil. In the eastern part of the city is the starting point of the Mohawk Indian trail, a macadamized road of great scenic beauty following the old trail of the Mohawk Indians used in their journeys between the Hudson River and the Connecticut River; built by the State of Massachusetts at a cost of \$350,000. Hudson Brook and its natural bridge are points of interest, and near is the famous Hoosac Tunnel, electrified by the New York, New Haven and Hartford Railroad in 1912. The chief industrial establishments are machine shops, cotton and woolen mills, boot and shoe factories, print-goods factories, creameries and cigar factories. The trade is chiefly in manufactures, farm and dairy products. It has a city hospital, good municipal buildings and a number of fine church edifices. The edu-

A HERD OF WINNIPEG BUFFALO

cational institutions are a State Normal School, high schools, public and parish schools and the North Adams Library. The charter of 1895 provides for a mayor, who holds office one year, and a council. The school committee, assessors and library trustees are elected by popular vote. The city owns and operates the waterworks. Pop. 22,282. Consult Spear, 'History of North Adams'; 'Berkshire Hills'; Rowe and Fairfield, 'North Adams and Vicinity, Illustrated' (North Adams 1898).

NORTH AMERICA. See AMERICA.

NORTH AMERICAN BUFFALO (*Bison Americanus*), the only species of the ox indigenous to America, though the *Bovidae* include the American antelope, Rocky Mountain sheep and goat, and the musk-sheep, or musk-ox. The bison is called buffalo by the Americans and Canadians, although it is very different from the buffaloes of the Old World. A generation ago it was found in vast numbers in the great prairies between the Mississippi and the Rocky Mountains; it occurs as far north as the vicinity of Great Marten Lake, latitude 63° or 64°, extensive level and marshy tracts there affording it suitable food. The American buffalo is very similar to that of Europe. It is generally smaller in size, and is said to attain at times a weight of 2,000 pounds. Its limbs and tail are short and the tail has fewer vertebrae than that of Europe. The horns are shorter and more blunt. The foreparts are still more shaggy, and retain more of that quality in summer. See BUFFALO; BISON.

NORTH AMERICAN INDIANS. See INDIANS, AMERICAN.

NORTH AMERICAN PHALANX, the most important colony founded by the Fourierists in the United States. It was organized in 1843 and located in Monmouth County, N. J., about 40 miles south of New York. The organization was on the joint-stock principle and all the members were engaged in the co-operative labor of the colony; they were paid a certain amount for labor, for talent (or administration) and for capital invested; the rule was to pay the highest prices for the hardest and most disagreeable labor. The labor was at first mostly agricultural, products being sold outside the colony; but later mills were built and a considerable amount of manufacturing done. A common-school education was provided. The life was simple and pleasant, there was a library and reading-room, but the colony lacked many of the elements of culture that distinguished the life of Brook Farm (q.v.). The management was good and for many years the colony prospered; in 1853 dissensions resulted in a secession of some of the members and the founding of a new phalanx; in 1854 the mills were burned down, a serious loss that badly crippled the colony; and in 1856 the organization was formally dissolved. Consult Noyes, 'History of American Socialisms.'

NORTH ANDOVER, Mass., town in Essex County, on the Boston and Maine Railroad and on the Essex River, about 30 miles north of Boston. It was a part of Andover until 1855 when it was incorporated as a town. It is a manufacturing place, but a large portion is reserved for residential purposes and it is noted for its beauty and healthfulness. The chief manufactures are woollen goods, mill ma-

chinery and wood products. The government is administered by town meeting. The waterworks are owned and operated by the town. Pop. (1920) 6,366.

NORTH ANNA, Operations on the. After the loss of 18,000 men in assaulting General Lee's lines at Spottsylvania Court House, General Grant concluded to turn Lee's position by a movement that would bring him nearer to Richmond and possibly interpose his army between Lee and that place. The movement was begun on the night of 20 May 1864 by Hancock's Second corps, which, preceded by Torbert's cavalry, marched for the Mattaponi and North Anna rivers. Torbert attacked and drove Kemper's brigade from an entrenched position at Milford Station and across the Mattaponi, Hancock following and entrenching beyond the river on the 21st. Other corps followed Hancock and Grant's advance reached the North Anna in the forenoon of the 23d at Island and Jericho fords and Chesterfield bridge the latter a mile above where the Richmond and Fredericksburg Railroad crosses the river. But Lee was in his front. He had detected the movement and put his army in motion for Hanover Court House, and on the morning of the 23d was south of the North Anna, in position covering the roads and railroads leading to Richmond. Here he was joined by General Breckinridge from the Shenandoah Valley, and by Pickett's division from near Richmond. Ewell's corps was on the right, Anderson's in the centre and A. P. Hill's on the left. Breckinridge and Pickett were in reserve. General Warren, with the Union Fifth corps, crossed the river at Jericho Ford, constructed a pontoon bridge and at 4.30 p.m. of the 23d his entire corps was in line of battle about half a mile from the river and on the edge of a wood next to it, the front being covered by the wood. Cutler's division was on the right, Griffin's in the centre and Crawford's on the left, its flank resting on the North Anna. About 6 p.m. Wilcox's division of A. P. Hill's corps fell upon Cutler's division and part of Griffin's, driving back Cutler in some disorder, following him and uncovering Griffin's right; but Griffin drew back his right, Bartlett's brigade hastened to his support and Wilcox was driven back with a severe loss in killed and wounded, and nearly 1,000 prisoners. Warren lost about 350 men. About the same time Hancock had prepared to force a passage at Chesterfield bridge. A part of Kershaw's division held a bridgehead north of the stream; that was charged and carried about 6 p.m. by the brigades of Colonels Pierce and Egan, with the loss of 150 men, the Confederates retreating across the river. The crossing of the river by Warren and Wilcox's unsuccessful effort against him forced General Lee to change and shorten his line during the night of the 23d, until it was nearly in the form of a right-angled triangle, with the right angle opposite Ox Ford and extending down the river three-fourths of a mile, then southeast to near Hanover Junction. The left, under A. P. Hill, ran from Ox Ford southwest across the Virginia Central Railroad to Little River. On the morning of the 24th Hancock crossed the river unopposed and began to entrench within 700 yards of Lee's line, where about 6 p.m. Smyth's brigade was attacked and became sharply engaged. Barlow's division was got ready to

attack, but Lee's entrenchments were found so strong that the attack was abandoned. At the same time Wright's Sixth corps crossed the river at Jericho Ford and joined Warren. Burnside's Ninth corps arrived at Ox Ford but could not cross in the front of the blunt angle of Lee's line holding the south side, upon which Potter's division was sent to the left and, crossing lower down, formed on Hancock's right, while Crittenden's division moved up stream to near Quarle's Mill and crossing joined Crawford's division of Warren's corps. Crittenden, supported by Crawford, moved forward to connect with and open the way for Wilcox's division to cross, but was attacked by Mahone's division and was driven back with severe loss. Everywhere Lee was found well entrenched. Grant found himself in a false position; his two wings on one side of a stream, difficult at times to cross and liable to sudden rise by heavy rains, while his centre was on the other side, with Lee's centre like a blunt wedge, standing ready to receive him and interposing between his wings, neither of which could support the other. The trains were ordered to recross the river on the 25th and on the night of the 26th Grant recrossed and, marching to the left 32 miles, crossed the Pamunkey at and near Hanover Town by the afternoon of the 28th, and was in connection with his new base at White House. Consult 'Official Records' (Vol. XXXVI); Humphreys, 'The Virginia Campaign of 1864-65'; Walker, 'History of the Second Army Corps'; Grant, 'Personal Memoirs' (Vol. II); Pennypacker, 'Life of General Meade'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

NORTH ATTLEBORO, ä't-l-bür-ö, Mass., town in Bristol County, on the New York, New Haven and Hartford Railroad, about 30 miles southwest of Boston. It includes the villages of Oldtown, Adamsdale, Falls Village and Robinsonville. It was settled in 1637 and incorporated in 1887. The chief industries of the town are connected with the manufacturing and sale of jewelry. It has establishments for the manufacture of boxes, buttons, braid, cotton yarn, rope, silverware, machinery and supplies for the jewelry business. Some of the prominent buildings are the G. A. R. Memorial Hall, Elks Home, the Holmes Memorial building, the high school and the Richards Memorial Library (public). The government is administered by town meetings. The town owns and operates the electric-light plant and the waterworks. Pop. 9,562.

NORTH BALTIMORE, Ohio, town in Wood County, 36 miles south of Toledo, on the Baltimore and Ohio and the Cincinnati, Hamilton and Dayton railroads. The town was settled in 1842 and incorporated in 1873. It is situated in an oil-field and has a supply of natural gas. Manufactures of oil-well machinery, bricks, stone-ballast and cigars engage the inhabitants and there are also flour-mills and grain elevators. Pop. 2,503.

NORTH BATTLEFORD, Canada, town in the district of Battleford, Saskatchewan, 230 miles northwest of Regina, on the Canadian Northern Railway. It is situated at the union of the Saskatchewan and Battle rivers. The town has a government building, a collegiate institute, electric light and power-

systems, waterworks and market. The industries include machine and engine works, sash and door factories, stone works, cement blocks and sills. Pop. 5,868.

NORTH BAY, Canada, capital of Nipissing district in the province of Ontario, on the north shore of Lake Nipissing, and on the Grand Trunk, Canadian Pacific, Canadian Northern and Temiskaming and Northern Ontario railroads. There are normal and high schools, lumbering and mining industries in the vicinity, planing and saw mills, machine and car repair shops and box factories. North Bay is the headquarters of the French River tourist traffic. Pop. 7,737.

NORTH BRADDOCK, Pa., borough in Allegheny County, on the Pennsylvania Railroad, about six miles east of Pittsburgh and two miles east of Homestead. It was a part of Braddock until 1897 when it was incorporated as a separate township. It has extensive steel rail interests, but a portion of the borough is a residential reserve. The government is vested in a burgess, who holds office three years, and a council. Pop. 14,928.

NORTH BROOKFIELD, Mass., town in Worcester County, 15 miles west of Worcester, on the Quaboag River and a branch of the Boston and Albany Railroad. It owns a public library and municipal waterworks. The industries include boots, shoes, rubber-goods, overalls and woolen and cotton fabrics. Pop. about 3,075.

NORTH CAPE, a promontory of Magerö Island, off the northern coast of Norway, in lat. 71° 11' N. It rises 968 feet above the sea and is regarded as the northernmost point of Europe, although a point nearby, the Knio-skjoerodde, is really a few minutes further north.

NORTH CAROLINA, kār-ō-lī'nā, one of the original 13 colonies, midway between Maine and Florida; bounded by Virginia on the north, by Tennessee on the west, by South Carolina and Georgia on the south and southwest and the Atlantic Ocean on the east. It extends from lat. 33° 51½' to 36° 34' N., and long. 75° 27' to 84° 20' W. from Greenwich, taking the greatest width each way. Tennessee originally was part of North Carolina, but in 1790 was ceded by it to the United States.

Area.—North Carolina ranks the 19th State in size in the Union, and is the largest on the Atlantic Coast save Georgia and Florida. It contains 52,286 square miles (including the area 3,620 square miles of its sounds and rivers) and is slightly larger than England. Its surface is very nearly a one thousandth part of the land area of the globe. Its greatest length from east to west from "Cherokee to Currituck" is more than 500 miles and its greatest width north and south is 188 miles.

Topography.—The State is divided by nature into three divisions—eastern, which is generally level, with many swamps and sandy, farther back with two great sounds near the ocean, the Albemarle and Pamlico; the central or hilly regions; and the western, which is mountainous. The coast line of more than 300 miles runs at first east of south, thence southwest. Along the whole ocean coast stretches a chain of narrow, barren sand banks, broken occasionally by inlets which are constantly changing, occasionally filling up entirely in the course

of years and new ones being opened by storms. The eastern division extends inland from the ocean about 150 miles. The dividing line between it and the central division trends southwardly and was once the shore line of the ocean, all east of it having been in prehistoric ages the bed of the sea. This line is clearly marked by the falls of the rivers. This eastern division contains the two great sounds already named into which the Chowan, the Roanoke, the Tar, the Neuse and other rivers pour their waters. Farther south, the Cape Fear and its tributaries empty directly into the Atlantic. The central division, beginning at an elevation above sea-level of about 200 feet, extends an average width of 200 miles westwardly, rising gradually to an average elevation of 1,200 feet or more at the foot of the Blue Ridge. The western part of this central region is called the "Piedmont section." The western division contains 6,000 square miles and has an average elevation of 2,500 feet. The highest peaks east of the Rocky Mountains are to be found here. The highest of them, Mount Mitchell, is 6,688 feet. There are no less than 24 peaks which are higher than Mount Washington in New Hampshire. The principal mountain ranges are the Blue Ridge and Great Smoky Range, but there are also the Black Mountains and the Balsam. The general trend is from northeast to southwest.

Rivers.—The rivers of North Carolina are numerous, but they are navigable only to the falls, the old shore line of the ocean in the east, hence the grand total of near 3,500 miles (of which scarcely more than 400 miles is navigable) indicates a vast water power which marks out the future of this State as one of the greatest manufacturing States in the Union. Indeed it may be well doubted if there is another which equals it in water power. At the "narrows of the Yadkin" the river has a fall of 50 feet in a distance of two miles.

Sounds and Lakes.—Besides the two great sounds, Albemarle and Pamlico, there are smaller ones, Currituck, Croatan, Roanoke, Core and Bogue. There are many lakes, the largest being Alligator, Phelps, Mattamuskeet, Pungo and Waccamaw. The largest (Mattamuskeet) has an area of 100 square miles, and Lake Phelps is about half as large.

Capes and Bays.—From the shore-line jut out Cape Hatteras and Cape Lookout, between which is Raleigh Bay. Lower is Cape Fear, between which and Cape Lookout lies Onslow Bay. South of Cape Fear is Long Bay. The ocean front of North Carolina is considered the most dangerous on the Atlantic seaboard.

Islands.—Roanoke Island between Albemarle and Pamlico sounds is the largest in the State and has an area of about 25 square miles. This island was the scene of the first English settlement on this continent, in July 1585. Here also was born the first child of the English race on this continent, Virginia Dare, 18 Aug. 1587. This colony made under the auspices of Sir Walter Raleigh (in whose honor the capital of the State is named) was soon abandoned. Cedar Island is nearly as large. Smith's Island at the mouth of the Cape Fear has nearly 15 square miles.

Climate and Rainfall.—The mean temperature is 59 degrees or about the average tem-

perature of the northern hemisphere. The State is on the same isothermal line as middle California, southern France and northern Italy. The rainfall is 60 inches for the eastern belt, 45 inches for the central and 58 inches for the western.

Geology.—The eastern division is covered with a stratum 50 to 300 feet thick of Tertiary sands and clays. It shows numerous marl deposits and phosphate beds. Through the central part of the State is a three-foot seam of triassic, not carboniferous, coal which is estimated to cover 70 square miles. The western part of the State shows azoic formations only.

Soil.—The soil of the eastern division is generally sandy. Along the rivers are extensive bottom lands of clayey loam, which are very fertile, while the swamp lands have a deep peaty black soil, and when drained are exceedingly fertile. In the central and western divisions the soil is clay, and gravelly or sandy loam.

Agricultural Products.—North Carolina is the only State that fills every blank in the census of farm products, yielding all the crops grown in both the northern and southern sections of the Union. Its greatest crops, however, are corn, cotton and tobacco. Cotton is grown in the eastern division and in the southern half of the central division. The yield in 1912 was 1,106,000 bales, eight times the quantity produced by this State in 1861, being the largest percentage of increase shown by any State since the Civil War, save Texas. In tobacco production North Carolina is second only to Kentucky and the area has been steadily increasing. Nine-tenths of the tobacco known in the markets of the world as "Virginia Brights" is grown in North Carolina. Durham is the largest shipper of manufactured tobacco in the country. Corn is grown in every county. Rice is produced in large quantities in the eastern division and in the production of sweet potatoes the State stands first. In the last few years there has sprung up a great trucking industry, which extends from Currituck to Brunswick. Grape culture has largely increased of late years and before prohibition no small quantity of wine was produced and shipped.

Timber.—The extent and value of the forests are especially noteworthy ranging from the palmetto, magnolia and live oak around Wilmington to the fir, hemlock and white pine in the mountains of the west. The vast quantities of pine and cypress, and of hardwoods, especially oak, hickory, ash, walnut and gum, have not only attracted saw mills, but have created large furniture factories at High Point and at other places. High Point has the largest output of furniture in the Union except Grand Rapids, Mich. Of the various species of trees found in the States east of the Rocky Mountains all the eight varieties of pine, the seven varieties of magnolia, the five varieties of maple and both varieties of walnut are found in North Carolina, while it produces 19 out of the 20 varieties of oak, four out of the five varieties of spruce, three each out of the five varieties of elm and birch respectively and six of the eight varieties of hickory. Immense quantities of turpentine, resin, tar and pitch are also produced from the vast tracts of pine forests.

Fauna.—Deer, red and gray foxes, rac-

coons, squirrels, opossums and rabbits are numerous, while wolves, bear, wildcats, beavers and others are still to be found. Swan, geese, brant and wild duck swarm in the sounds, bays and rivers of the east in the cold months, while in all parts of the State quail, woodcock, snipe, doves and wild pigeons, larks and many other birds are numerous. The attraction to sportsmen has been so great that a close season for game has been enacted by the legislature, and an Audubon Society has been authorized by the legislature for the protection of birds.

Fisheries.—More than 20,000 men are employed in the fisheries on the sounds and at the mouths of the rivers. More than \$2,500,000 capital is invested. The shad and herring fisheries are especially valuable. Some of the seines are from a mile to three miles long and are operated by steam power. There are 26 counties interested in this industry, the principal ones being Currituck, Pasquotank, Chowan, Bertie, Beaufort, Dare, Pamlico, Craven, Carteret, Onslow, New Hanover and Brunswick. Herring are mostly cured in salt and shipped in barrels, but the shad, striped bass, chub, perch and other fish are shipped on ice, the large fisheries having each its own ice factory. The State in 1876 organized its fish commission, establishing fish hatcheries which largely increased the catch of fish. Of recent years the United States government has taken over this work and has a shad and herring hatchery at Edenton and a similar establishment for rock bass and salmon at Weldon, at the falls of Roanoke River. The young fish thus hatched are set free in all the principal rivers and waters of the State and in other States, some being shipped even to the rivers of the Pacific coast. The oyster and shellfish industry in the eastern waters are also of great value. The State has an oyster and shellfish commission which owns a steamboat and has many agents to encourage and protect this industry. The oysters are of fine quality, those of New River being especially prized. Diamond-back terrapins and turtles are found all along the coast and are shipped North and inland, as are also large quantities of clams.

Navigation.—Vessels drawing 24 feet can ascend the Cape Fear River 30 miles to Wilmington, while the river is navigable 120 miles further to Fayetteville, to which point the Federal government is deepening the channel to eight feet. The Roanoke is navigable 130 miles to Weldon, the Tar and the Neuse about 100 miles each and the Chowan for 75 miles. Two canals connect the Albemarle and Pamlico sounds with Chesapeake Bay, and Congress has passed a bill to establish an inland waterway along the whole front of the State by deepening the sounds which lie behind the sand banks that fringe the seaboard. Much of the work has been done.

Manufactures.—The water power of the State owing to the great non-navigable extent of its rivers and streams is very great, in fact more than twice enough to manufacture the entire cotton crop of the South. Already the State has more cotton factories than any other in the South and is a large manufacturer of tobacco. Other factories of all kinds have greatly increased in number. There are over 60,000 persons employed in tobacco manufacturing and over 70,000 in the cotton factories.

Child labor under 14 years of age is forbidden by law in factories of all kinds. The chief manufactories of tobacco are to be found at Durham, Winston, Reidsville and Henderson. There are also cotton factories at those points and at Charlotte, Raleigh, Concord, Salisbury, Fayetteville and at other towns as well as at many points on the streams remote from towns, especially in Alamance, Mecklenburg and Gaston counties, which counties have the largest number of cotton factories of any in the State.

Minerals.—The State has areas of coal, copper, gold, mica, iron, corundum, kaolin and marl. The last is to be found only in the eastern part of the State, the others in the centre and west. Silver, lead, zinc, zircon, graphite and manganese are also found. The deposits of iron are widely distributed over the State, the most abundant kind being the magnetic. The Cranberry iron mine in Mitchell County yields an ore unsurpassed in the world. There are two bituminous coal fields—one in Chat-ham and Moore counties and the other in Stokes and Rockingham. Both are in close proximity to extensive deposits of iron. Gold is found in 29 counties, mostly in the centre and west of the State, and more than 40 mines are being worked. Up to the discovery of gold in California, North Carolina was the largest gold producing State in the Union; the total yield up to date has been about \$30,000,000. Tin has been found in Cleveland County. At one time three-fourths of all the mica in the world was mined in this State and largely in Mitchell County. It is of a superior quality and plates three and four feet across are not unusual. Beautiful marble underlies large sections of Cherokee and Clay counties in the extreme west. Granite, sandstone and porphyry are to be met with in large quantities, and superior stone for grist mills is quarried in Moore County. Near Wilmington are valuable phosphate beds. The State produces more corundum than any other locality in the world and of the best quality. The valuable gems, diamonds, emeralds, rubies, garnets, amethysts, opals, agates and hiddenites are found. A fine exhibition of minerals, gems, marbles and stones of all kinds is to be seen in the Museum of the State Agricultural Department at Raleigh. At Dunn's Mountain near Salisbury is an exhaustless supply of granite almost as white as marble, and at Mount Airy is an equally large quarry of light gray granite. Near Raleigh is the granite quarry from which the material for the State Capitol was taken. Indeed granite quarries of good quality are to be found in most of the counties and sandstone quarries are numerous. Mineral springs are numerous, the most noted being the Panacea Springs in Halifax County and the Seven Springs in Wayne in the east, while in the centre and west are the Hot Springs in Madison, the Sulphur Springs in Jackson, the Glen Alpine and Connelly Springs in Burke, the Vade Mecum Springs in Surry, the Lithia Springs in Lincoln, Cleveland Springs in the county of that name, Jackson Springs in Moore, and there are many others. Among natural objects of interest are Mount Mitchell, the highest peak on this continent east of the Rocky Mountains; Linville and Cullasaja Falls; Hickory Nut Gap and the adjacent Chimney Rock; Table Rock and Paint Rock.

Railroads.—There are now over 5,000 miles

of railroad in operation and several hundred miles more under contract or in contemplation. There are street railways in all the larger towns and a few miles of rural trolley lines with many more proposed. The four principal railway systems are the Southern, the Seaboard Air Line, Norfolk Southern and the Atlantic Coast Line. The railroads are valued for taxation at \$125,000,000, but this is very much less than half their true value, as they were returned in the census of 1890 as worth at that time \$151,000,000.

Government.—The present constitution, adopted in 1868, amended by a convention in 1875 and by several amendments submitted by legislatures since and ratified by the people, provides for an executive department consisting of a governor (not re-eligible), a lieutenant-governor, secretary of state, treasurer, auditor, superintendent of public instruction and attorney-general, all elected by the people for four years. There is also a commissioner of agriculture, a commissioner of labor and a commissioner of insurance elected by the people and a corporation commission of three members elected by the people for a term of six years. The legislative department consists of 50 senators and 120 members of the house of representatives elected by the people every two years. The judicial department consists of a Supreme Court composed of a chief justice and four associates chosen by the people for eight years and 20 Superior Court judges, who are chosen for the like period by the people and who ride in rotation 10 Superior Court districts, the State being divided into two divisions.

Education.—North Carolina was the second State to establish a State university, which it did in 1789 at Chapel Hill. It has now also the State Agricultural and Mechanical College at Raleigh, a Training School for Teachers (women) at Greenville and a State College for Women at Greensboro. These four constitute a complete system of higher education by the State. There is also a State Agricultural College for the colored at Greensboro. There are also many sectarian colleges, of which the Baptists have one at Wake Forest, the Presbyterians at Davidson, the Methodists at Durham and there are others. There are also several colleges for women, and three colleges for the colored people. As early as 1825, the State provided a public school fund and in 1840 established a public school system. This now provides instruction in primary and intermediate grades, free of charge, to all children between the ages of 6 and 20. There are over 900,000 pupils in the public schools. There is an annual appropriation for normal institutes for the instruction of both white and colored teachers. The public school system supported by State appropriations is supplemented by graded schools for free education maintained in all the larger towns by local appropriations. The public funds for education are divided between the whites and blacks per capita. Besides the State Library of 80,000 volumes, and the Law Library of the Supreme Court of 40,000 volumes, both at Raleigh, several towns have public libraries and the university and all the colleges maintain libraries. The State has also established libraries for the public schools in the rural districts.

Penal and Charitable Institutions.—The

State has established a penitentiary at Raleigh, three insane asylums—one at Goldsboro for the colored people, the other two for the whites at Raleigh and Morganton. There is an Institution for Deaf-Mutes for the whites at Morganton and one for the colored deaf, dumb and blind at Raleigh and an Institution for the Blind for the whites also at Raleigh.

Counties.—There are 100 counties, of which Robeson is the largest and New Hanover the smallest. Guilford has the largest population and Clay the smallest. There are railroads in all the counties except seven.

Cities.—The principal towns are Wilmington, the chief seaport, 30 miles above the mouth of the Cape Fear, up to which vessels can come drawing 24 feet; Raleigh, the State capital, named in honor of Sir Walter Raleigh; Charlotte, Greensboro, Salisbury, Statesville and Winston in the central part of the State; Asheville, Waynesville and Morganton in the west, and Fayetteville, Goldsboro, Washington, Elizabeth City, New Bern and Beaufort in the east, the last four being, like Wilmington, seaport towns.

Colonies.—There is a growing stream of immigration from the North, which in some instances has taken the form of colonies, the most successful and prosperous of which is at Southern Pines in Moore County. This State has the smallest per cent of foreign population in the Union, and indeed irrespective of percentage the smallest foreign population of any State.

Population.—By the census of 1910 North Carolina had a population of 2,206,287; of which 1,500,513 were whites; 697,843 were negroes and 2,015 Indians. There were 1,098,471 males and 1,107,816 females. There were something more than two whites to every negro. The bulk of the negro population is in the eastern division and the southern half of the central division. There are very few negroes in the mountain country. The population (1920), according to the returns of the Census Bureau, is 2,559,123, of which about 70 per cent is white and 30 per cent colored.

History.—The coast of North America was first seen by John Cabot in 1497, and 87 years later the first attempt by the English to establish a colony on this continent was made by Sir Walter Raleigh, whose exploring expedition of two ships arrived at Wokoken Inlet on the coast of North Carolina 4 July 1584. This expedition landed at Roanoke Island and carried back two savages, Wanchese and Manteo. The next year Raleigh sent out a fleet of seven ships under Sir Richard Grenville which settled 108 colonists on the island under Gov. Ralph Lane. Falling into straits for want of food these colonists were taken home in June 1586 by Sir Francis Drake, who was returning with his fleet from a raid upon the Spaniards in the West Indies. Soon after they left, Sir John Grenville arrived with relief, but not finding the colony left 15 men and returned home. In 1587 a new colony consisting of 89 men, 17 women and 2 children came out under Gov. John White. His daughter, the wife of Ananias Dare, on 18 Aug. 1587 gave birth at Roanoke Island to Virginia, the first child of English parentage born on this continent. Governor White soon returned to England, but the Spanish Armada of 1588 prevented aid being sent to

the colony till 1590, at which time the colony had disappeared and the fate of the "Lost colony of Roanoke" is one of the unsolved problems of history. The next settlement by the English was made at Jamestown, Va., in 1607. In 1629 a grant of Carolina was made to Sir Robert Heath and an abortive attempt at settlement was made in 1639. Gradually scattering settlers came into the Albemarle and Pamlico region from Virginia, and in 1660 a New England colony bought land from the Indians and settled near the mouth of the Cape Fear. They soon left, but were succeeded in 1663 by a colony from Barbados under Sir John Yeamans, who repurchased the land from the Indians. This settlement was abandoned in 1690. On 24 March 1663 Charles II granted to the Duke of Albemarle (the restorer of the monarchy) and seven others, as Lords Proprietors, all the country between the Atlantic and Pacific oceans and between latitudes 36° and 31°, and William Drummond was appointed governor. In 1665 a second charter to the same Lords Proprietors was granted, extending the limits to lat. 36° 30' on the north. The first legislature was held in 1665. In 1669 the "Fundamental Constitutions of Carolina" drawn up by the famous John Locke were adopted by the Lords Proprietors and were sent out to the colony. They proved too elaborate and cumbersome for the handful of pioneers, residing mostly in the northeast of the province, on Albemarle Sound, and after a nominal existence were repealed in 1693. Twenty proprietary governors followed in rapid succession. For the most part, save Drummond and Archdale, they were very unfit, and often unworthy men. The sturdy colony deposed six of them and sent them back. One (Sothel) they put into prison and forced him to take an oath of abdication. In 1677 under Governor Culpeper there was open rebellion on account of undue taxation on tobacco and interference with trade regulations. Again in 1708 under Thomas Carey there was a rebellion on account of the taxation of Quakers and Dissenters for the support of the Established Church. For more than two years there was no government of any kind in force, the farmers attending to their crops and "doing and saying what they list." In 1691 was adopted a system of having one governor for Carolina with a lieutenant-governor each for Albemarle and Charleston, the two principal settlements. In 1708 Bath was incorporated as the first town. In 1710 Governor Hyde, a cousin of Queen Anne, came out as the first governor of North Carolina. On 20 Sept. 1711 the Tuscarora Indians, by preconcert, fell upon and massacred the settlers on the Roanoke, Neuse and Pamlico. The war lasted two years, but with the aid of troops from South Carolina the power of the Indians was broken with the capture of their fort at Nahucke in the spring of 1713. In 1718, Edward Teach, commonly known as "Blackbeard," the leader of the pirates who had troubled the colony, was killed in a sea fight off Bath, which put an end to piratical depredations. In 1728 the long boundary dispute with Virginia was settled, the line being surveyed to the foot of the mountains. In the same year seven of the Lords Proprietors sold out their interest to the Crown for \$87,500. Earl Granville retained his one-eighth which was set off to him as a

strip of land, 70 miles wide, next to the Virginia boundary, though he surrendered all right to share in the government. At this time there were three counties, Albemarle, Bath and Clarendon, divided into eight precincts. In 1729 the above counties were abolished, the precincts becoming counties, and the colony was definitively divided into North Carolina and South Carolina. The population of North Carolina was then about 40,000. The royal government thus established continued until the Revolution. There were five royal governors, George Burrington, 1729-34; Gabriel Johnston, 1734-52; Arthur Dobbs, 1754-65; William Tryon, 1765-71; Josiah Martin, 1771-75. During this period immigration came in rapidly, mostly from Virginia and Pennsylvania, so that at the outbreak of the Revolution the population had risen to 300,000 and there were settlements to the mountains and beyond. There were Scotch settlements made after Culloden on the Cape Fear. Germans and Moravians came in by way of Pennsylvania, from which also and from Charleston came many Scotch-Irish. In 1740 the province sent a battalion to join the English expedition against Carthage in South America. In 1749 the first printing-press was set up. The first book was printed in 1752 and a crude postal service was established in 1755. In 1758 the colony sent a regiment under Col. James Innes to Winchester, Va., to take part in the war against the French and Indians, and soon after sent other troops under Hugh Waddell against the Cherokees in the west of the province. The colony openly resisted the Stamp Act and on 16 Nov. 1765 forced the stamp master, William Houston, to resign his office and to swear not to receive the stamps. In February 1766 under the leadership of Hugh Waddell and John Ashe the inhabitants of Wilmington, without using any disguise, boarded the *Viper*, sloop of war, and demanded and obtained the release of certain merchant vessels which had been seized on account of failure to observe the Stamp Act. A few days later 700 armed militia surrounded the house of Governor Tryon and took therefrom in his presence the comptroller of the province and enforced him to do what Houston had done. In 1765 an agitation began against the exaction of exorbitant official fees and poll-tax which culminated in open war, known as the Regulators War, in which the insurgents were crushed by Governor Tryon at the battle of the Alamance 16 May 1771. This was really the first bloodshed in the Revolution. In August 1774 a Provincial Congress was held in New Bern in defiance of Governor Martin's prohibition, which elected delegates to the Continental Congress. In Edenton 51 women held the famous "Tea Party," subscribing to a paper to boycott the use of East India tea and to abide by the action of the Provincial Congress. Patriotic meetings were held in many counties. Soon after the receipt of the news of Lexington and Concord, the people of Charlotte assembled, 20 May 1775, and declared the country independent of Great Britain and by special messenger sent a copy of their proceedings to the Continental Congress. This was the first declaration of the kind in America. In honor of this event, "20 May 1775" is borne on the State seal and flag. Governor Martin fled from New Bern 14 June 1775 and took

refuge on a British man of war. On 12 April 1776 the new State instructed its representatives in the Continental Congress to vote for independence, being the first State to do this. A free constitution was adopted in that year. The first victory for the patriot cause was that gained by the North Carolina militia at Moore's Creek 27 Feb. 1776. The State furnished 10 regiments of "Continental" regulars and many thousands of militia for shorter "tours of duty." In 1780-81 the State was invaded by Cornwallis. On 7 Oct. 1780 a most damaging blow was inflicted on him by the destruction of Ferguson and his detachment at King's Mountain, the bulk of his assailants being from North Carolina and Tennessee (then a part of North Carolina). On 15 March 1781 was fought the battle of Guilford Court House. The Americans under Greene retired, but the result was a practical defeat for Cornwallis, who fell back to Wilmington, whence he marched to his fate at Yorktown. North Carolina was represented in the Federal Constitutional Convention at Philadelphia in 1787, but it was the last State but one to ratify the Constitution, which it did not do till assured of the adoption of the first 10 amendments to that instrument. It rejected the Federal Constitution in 1788, but ratified it in November 1789. Thus it did not participate in the first election for President. At the first census, 1790, it was the third State in point of population (391,000), coming after Virginia and Pennsylvania only, and ahead of New York and Massachusetts.

One of the first acts of the State as a member of the Union was the cession of Tennessee, which was accepted by the United States 2 April 1790. The permanent capital was located at Raleigh by statute in 1791. There soon set in a tide of emigration to Tennessee, then to other Southern and Western States, so that North Carolina which in 1790 ranked third in population was only eleventh in 1840. This tide showed no slackening until after 1850. In the War of 1812 the State furnished nine regiments, two of which went to Norfolk, and one to Jackson's aid in the Creek War. Capt. Johnston Blakely of Wilmington commanded the United States sloop *Wasp* and destroyed many English ships. Among its many privateersmen who preyed on the enemy's commerce Capt. Otway Burns was the most famous. In the Mexican War the State sent a regiment and two companies.

North Carolina was the next to the last State to enter the Federal Union in 1789 and she was the next to the last to leave it in 1861. The State voted against Secession in February of that year, but when President Lincoln called for troops to coerce the seceding States and Virginia had seceded, North Carolina on 20 May 1861 followed her example. The die was cast, she did her full duty to the cause she had espoused. With a voting population (white) of 112,000 in 1861 she sent over 127,000 men to the Confederate armies. Some 5,000 or more (whites and blacks) joined the Union forces. The first man killed on the Southern side in battle was a soldier from this State, Henry L. Wyatt, at Bethel, Va., 10 June 1861, and historians claim that the dead left nearest the enemies' lines at the pivotal battles of Gettysburg and Chickamauga were North Carolina's sons,

and they fired the last volley at Appomattox. The captures of Fort Hatteras, Fort Fisher, of Plymouth, the battle of Bentonville 19-21 March 1865, and the surrender of Joseph E Johnston 26 April 1865 were the most notable events of the war which took place on her soil. Wilmington was famous as a port for blockade running and was the last to be closed. Her war governor was Zebulon B. Vance, afterward for many terms United States senator. The State lost 42,000 killed and wounded, or about one-third of the troops she furnished to the Confederacy. In 1868 began the era of Reconstruction, when the blacks were first allowed to vote and the "carpet bag" rule began. The Ku-klux Klan (q.v.) was organized as a protest against this in 1869, and the State was in a turmoil until the whites regained full control of the government. In 1870 Governor Holden was impeached and removed from office. The State has grown rapidly in population and development since the War. In 1894 and 1896 the Populist and Republican parties combined and carried the State. In 1898 the State again became Democratic and the general assembly submitted a constitutional amendment disfranchising the uneducated negroes, which was ratified by the people in 1900. Prohibition was adopted on a referendum vote in 1908. The history of the State may be divided into three periods, i. e., the Proprietary Government (1663-1729), during which time the governors were appointed by Lords Proprietors and were as follows:

GOVERNORS OF NORTH CAROLINA.

Proprietary period (1663-1729)

William Drummond.....	1663-1667
Samuel Stephens.....	1667-1669
Peter Carteret.....	1669-1673
John Jenkins, President of Council.....	1673-1676
Thomas Eastchurch.....	1676-1677
Thomas Miller, President of Council.....	1677-1678
John Harvey, President of Council.....	1678-1679
John Jenkins.....	1679-1681
Henry Wilkinson.....	1681-1683
Seth Sothe (or Southwell).....	1683-1689
Phillip Ludwell.....	1689-1691
Alexander Lillington, Deputy Governor.....	1691-1694
Thomas Harvey, Deputy Governor.....	1694-1699
Henderson Walker, President of Council.....	1699-1704
Robert Daniel, Deputy Governor.....	1704-1705
Thomas Carey, Deputy Governor.....	1705-1705
William Glover, President of Council.....	1706-1707
Thomas Carey } Contestants (Carey's Rebellion)	1707-1710
William Glover.....	1710-1712
Edward Hyde, Deputy Governor.....	1712-1714
Thomas Pollock, President of Council.....	1714-1722
Charles Eden.....	1722
Thomas Pollock, President of Council.....	1722-1724
William Reid, President of Council.....	1724-1725
George Burrington.....	1725
Edward Mosely, President of Council.....	1725-1729
Sir Richard Everard.....	

The Second or Royal Period extended from 1729-1776. The following were the governors appointed by the Crown:

George Burrington.....	1731-1734
Nathaniel Rice, President of Council.....	1734
Gabriel Johnston.....	1734-1752
Nathaniel Rice, President of Council.....	1752-1753
Matthew Rowan, President of Council.....	1753-1754
Arthur Dobbs.....	1754-1765
William Tryon.....	1765-1771
James Hasell, President of Council.....	1771
Josiah Martin.....	1771-1775

In 1776 began the government under the republic. The governors thereunder were

elected by the legislature annually until 1837, and were as follows:

Richard Caswell	1775-1779
Abner Nash	1779-1781
Thomas Burke	1781-1782
Alexander Martin	1782-1784
Richard Caswell	1784-1787
Samuel Johnston	1787-1789
Alexander Martin, Federalist	1789-1792
Richard Dobbs Spaight, Sr., Republican	1792-1795
Samuel Ashe, Republican	1795-1798
William Richardson Davie, Republican	1798-1799
Benjamin Williams, Republican	1799-1802
James Turner, Republican	1802-1805
Nathaniel Alexander, Republican	1805-1807
Benjamin Williams, Republican	1807-1808
David Stone, Republican	1808-1810
Benjamin Smith, Republican	1810-1811
William Hawkins, Republican	1811-1814
William Miller, Republican	1814-1817
John Branch, Republican	1817-1820
Jesse Franklin, Republican	1820-1821
Gabriel Holmes, Republican	1821-1824
Hutchings G. Burton, Republican	1824-1827
James Iredell, Republican	1827-1828
John Owen, Democrat	1828-1830
Montford Stokes, Democrat	1830-1832
David Lowry Swain, Democrat	1832-1835
Richard Dobbs Spaight, Jr., Democrat	1835-1837

In consequence of the Convention of 1835 the governors were made elective, for a term of two years, by the people. During the period since, the following filled the office:

Edward B. Dudley, Whig	1837-1841
John M. Morehead, Whig	1841-1845
William A. Graham, Whig	1845-1849
Charles Manly, Whig	1849-1851
David S. Reid, Democrat	1851-1854
Warren Winslow (ex-officio), Whig	1854
Thomas Bragg, Democrat	1855-1859
John W. Ellis, Democrat	1859-1861
Henry T. Clark, Democrat	1861-1862
Zebulon B. Vance, Democrat	1862-1865
William W. Holden, Republican (appointed by President Johnson)	1865
Jonathan Worth, Conservative	1865-1867

In 1867 Maj. Gen. Daniel E. Sickles was appointed Military Governor of District No. 2 consisting of North Carolina and South Carolina, and was succeeded in that position by Maj. Gen. E. R. S. Canby in 1867, who held under the Constitution of 1868. William W. Holden was elected governor. He was removed by impeachment in August 1870. The following have been the governors since that date:

Todd R. Caldwell, Republican	1870-1874
Curtis H. Brogden, Republican	1874-1877
Zebulon B. Vance, Democrat	1877-1879
Thomas J. Jarvis, Democrat	1879-1885
Alfred M. Scales, Democrat	1885-1889
Daniel G. Fowle, Democrat	1889-1891
Thomas M. Holt, Democrat	1891-1893
Elias Carr, Democrat	1893-1897
Daniel L. Russell, Republican	1897-1901
Charles B. Aycock, Democrat	1901-1905
Robert B. Glenn, Democrat	1905-1909
William W. Kitchin, Democrat	1909-1913
Locke Craig, Democrat	1913-1917
T. Walter Bickett, Democrat	1917-1921
Cameron Morrison, Democrat	1921-

The Court System, adopted in 1776, provided for a Superior Court system of three judges. These were increased in number to four, and in 1800 an Appellate Court was established consisting of the Superior Court judges in conference. This title was changed to Supreme Court in 1805, but there were no separate judges until the Supreme Court was created by legislative enactment in November 1818, to take effect 1 Jan. 1819. This court consisted of three judges up to 1868, when the court was created by the constitution and consisted of five judges until 1 Jan. 1879, when the number was reduced to three. It was again

increased to five judges, to take effect 1 Jan. 1889. The chief justices have been as follows:

John Louis Taylor	1819-1829
Leonard Henderson	1829-1833
Thomas Ruffin	1833-1852
Frederick Nash	1852-1858
Richmond M. Pearson	1858-1878
William N. H. Smith	1878-1889
August S. Merrimon	1889-1892
James E. Shepherd	1892-1894
William T. Faircloth	1895-1901
David M. Furches	1901-1901
Walter Clark	1903-

Under the constitution of December 1776 the general assembly was elected annually. The members of the house of commons were chosen by manhood suffrage and the senate by freeholders owning 50 acres of land or more. The qualification of electors for the State senate was changed in 1856 to manhood suffrage. Free colored men were qualified as voters until disfranchised by the convention of 1835. The constitution of 1868 removed all disqualification of electors because of race, but in 1899 an amendment was adopted which disqualified negroes who were illiterates.

By the constitution of 1868 elections for the general assembly were made biennial, the office of lieutenant-governor to preside over the senate was created, and the term of State executive officers was made four years. The terms of the judges is eight years.

Bibliography.—The histories of the State are: Hugh Williamson (2 vols., up to 1771); Martin (2 vols., up to 1776); F. L. Hawks (2 vols., for the period 1663-1729); John H. Wheeler (1 vol., 1663-1850); John W. Moore (2 vols., to 1876); S. A. Ashe (Vol. I, to 1783, Vol. II to date, in preparation). Among the histories of certain periods are G. W. Graham, 'The Mecklenburg Declaration'; Foote's 'Revolutionary Sketches'; Mrs. C. P. Spencer's 'Last 90 Days of the War'; Clark, Walter, 'History of North Carolina Regiments' (5 vols., 1861-65); Battle, Kemp P., 'History of the University of North Carolina' (2 vols., 1798-1912); and Schenck, David, 'North Carolina' (1780-1781). The State has published 'The Colonial Records of North Carolina, 1629-1776' (10 vols., edited by W. L. Saunders), and 'The State Records of North Carolina, 1776-1790' (16 vols., edited by Walter Clark), with four volumes of Index to the above by Stephen B. Weeks.

WALTER CLARK,

Chief Justice Supreme Court, North Carolina.

NORTH CAROLINA, University of.

The University of North Carolina is situated among the hills of Orange County in the town of Chapel Hill, 500 feet above the sea. The charter of the university was granted in 1789. The cornerstone of its first building, the Old East, was laid on 12 Oct. 1793, now known as University Day. Its endowment by the State was in the form of old claims on sheriffs and other public officers and escheats, including unclaimed land warrants, to be located in West Tennessee, granted to soldiers of the Continental Line. Only a small sum was realized from these sources for many years. The money which enabled the doors to be opened in January 1795, was realized from donations in small amounts by friends of education and a loan of \$10,000 by the State, afterward converted into a gift.

The management was at first entrusted to Rev. David Ker, D.D., afterward Federal judge of Mississippi Territory, as presiding professor. The post fell successively to Profs. Charles W. Harris, Joseph Caldwell and James S. Gillaspie, but in 1804 the trustees elected Caldwell, a graduate of Princeton, to the office of president. Dr. Caldwell in 1812 resigned the presidency, in order to devote himself to his department of mathematics. His successor, Rev. Robert Hett Chapman, born in New York, held the presidency four years, when Dr. Caldwell was re-elected. In 1835 the residue of the Tennessee lands was sold and an endowment of about \$200,000 realized. The new president, ex-Governor David Lowrie Swain, was widely and favorably known. The number of students increased and when, in the decade beginning with 1850, the South became prosperous, the number of students reached as high as 461 in 1858-59.

The alacrity with which the students rushed into the Civil War may be gathered from the fact that out of the 243 freshmen in the three years ending in 1861 only 16 became graduates. Two hundred and seventy alumni are known to have lost their lives in the struggle. Although numbers diminished, the energy of President Swain kept the doors open until the end of the war, and until the trustees, elected under the Reconstruction Acts in 1868, dismissed all the faculty and suspended the exercises for six months.

The endowment of the university was lost during the Civil War. The new president, Solomon Pool, after a year's trial, was forced to close the doors. By a constitutional amendment the general assembly elected a new board of trustees in 1874. These were hindered by legal difficulties, thrown in the way, from taking charge until the next year. The doors were then reopened, alumni and friends repairing the buildings and the general assembly granting a small annuity, coming from the land scrip fund, Rev. Charles Phillips, D.D., being chairman of the faculty. Soon an annuity of \$20,000 from the State was secured, and that, with income from endowments and tuition money, enabled the trustees to increase the faculty largely and add to the library and apparatus.

In 1877 the university was the first institution in the South to inaugurate a summer normal school. It was continued with much success, and has been one of the chief agents in arousing the spirit of education in the State.

Since 1875 the old curriculum of Latin, Greek and mathematics, with a small amount of scientific and other studies, has been abandoned. An equal attention is paid to the sciences, well-equipped laboratories supplied and courses mapped out leading to the degree of A.B. The departments of the university have been increased until they now embrace a collegiate department leading to the degree of A.B., a graduate department giving the degrees A.M. and Ph.D., a law department having a two-years' course leading to B.L., a medical department giving two years at Chapel Hill and two years at Raleigh with the degree of M.D., a pharmacy department with a two-years' course leading to Ph.G., and an engineering department.

Women are admitted to certain courses. In 1922-23 the institution had 1,870 students and 125 members in the faculty. The campus covers about 50 acres and with the buildings and other

property is valued at \$4,000,000. The income is about \$480,000 annually and the library contains 100,000 volumes.

NORTH CAROLINA COLLEGE OF AGRICULTURE AND MECHANIC ARTS, a technical industrial institution founded in 1889 at West Raleigh. It was the result of a movement that had been agitated for some years by a small but earnest and determined set of men who became convinced that the industrial growth of the State was being retarded by the lack of technically trained men to assist and guide this development. The college opened its doors to students in October 1889, and, like all new enterprises, at first encountered some hostility, a great deal of indifference and incredulity being exhibited as to its power to do the work that was wanted. When the college opened it had only one building, very little equipment and only five professors present for duty. Since then, nine other large and comfortable buildings have been added, and the shops, the drawing-rooms, the chemical, the physical, the horticultural, the electrical laboratories, the barn, the dairy and all the class rooms have been equipped with the best modern apparatus to do thorough and practical work. The specific object of the college is to give young men, besides a general education, a technical training that will make them self-sustaining in life and intelligent directors of agricultural and mechanical enterprises. A regular college course, minus the classical languages but plus scientific studies in particular lines, is offered at tuition fees so low as to attract young men from all parts of the State. Four years' courses are offered in agriculture, civil, mechanical, electrical and chemical engineering, textile work, cotton manufacturing, and dyeing; the degrees conferred for the completion of these courses are bachelor of agriculture and bachelor of engineering; there are also graduate courses, two years' courses in agriculture, mechanic arts and cotton manufacturing and twelve weeks' courses in agriculture, carpentry, machine shop work, engine and boiler tending and machine drawing and designing. The experiment station is also connected with the college and receives an annual Federal appropriation. The college controls the national land grant of 1862, and also receives State and Federal appropriations; in 1922-23 the income amounted to over \$400,000. The library contains 20,000 volumes; the students numbered 1,225 and the faculty 102. The buildings and grounds and other property are valued at \$2,500,000.

NORTH CHICAGO, Ill., city in Lake County, on Lake Michigan, 35 miles from Chicago and three miles south of Waukegan, on the Chicago and Northwestern and the Elgin, Joliet and Eastern railroads. A United States naval training station is situated here. The town manufactures gas-machines, wire-fencing and gates, springs, brass and iron-castings, envelopes, cards, portable elevators and milk-machinery. It also owns machine-shops and zinc works. Pop. 3,306.

NORTH DAKOTA, *da-kō'ta*, is one of the North Central States of the American Union. It is bounded on the north by the Canadian provinces of Saskatchewan and Manitoba; on the south by South Dakota; on the east by Minnesota, and on the west by Montana.

Its area is 70,837 square miles, of which 654 miles is water. It extends 360 miles east and west and 210 miles north and south. Its capital is Bismarck.

Topography.—Extending in a curve from the northwest border to the centre of the State is the escarpment of the Coteau du Missouri. That portion of North Dakota which is to be found northeast of this coteau lies in the so-called Prairie Plain region of the American continent. Southwest of this escarpment the State lies in the Great Plain region. The prairie plain is level or gently rolling and is divided into two great tablelands. The eastern and lower of these is the famous Red River Valley which begins in Minnesota and extends through the State of North Dakota as far north as Lake Winnipeg in the province of Manitoba. This valley is remarkably level throughout its entire length, being 965 feet above the sea at Wahpeton, at its southeastern extremity, 836 feet at Fargo, some 60 miles north of that point and 798 feet at Pembina, or at the extreme northeast boundary of the State. West of the northern portion of the Red River Valley and 30 miles west of the river are the so-called Pembina Mountains, a range of low hills which forms a part of its escarpment and serve to partially divide it from the second of the prairie plains. In Walsh County and some 40 miles from the northern boundary of the State, this second plain is some 500 feet higher than the Red River Valley, from thence it gradually ascends to the so-called Coteau de Prairies in Sargent County at the southern boundary of the State, where it attains an elevation of about 2,000 feet. The surface of this area is level or gently rolling, but is not as a whole nearly as level as that of the first plain or Red River Valley. It has but one range of hills, the so-called Turtle Mountains, whose area is some 800 square miles, and a small portion of which is in Manitoba. The highest points of this range, however, are only 2,400 feet above the level of the sea. This region is of great beauty and is dotted with numerous lakes. West of this second prairie plain or plateau is another ridge or escarpment of some 400 feet in height and 20 to 50 miles in width, the northern portion of which forms the watershed between the Hudson Bay and the Gulf of Mexico. West of this ridge is the third plateau which comprises that portion of the State which is in the Great Plains as opposed to the Prairie Plains region. It comprises almost a half of the State and rises gradually toward the west until it reaches an altitude of some 3,300 feet in Bowman County. Thence it extends westward through Montana until it merges in the foot hills of the Rocky Mountains. In the southwest portion of this area are the so-called Bad Lands. Here the burning coal beds have baked the clay of the buttes into striking colors and the erosion of the centuries has given to them fantastic forms of rare beauty. This region, and in fact almost all of the country west of the Missouri River, lies beyond the limit of the glacial ice beds which spread over the rest of the State, and which not merely planed down the hills but filled the crevices and valleys with glacial drift. It is for this reason that the effects of the erosion of the waters is here more marked and that the western portion of the State, though nearly all

arable, is more rolling and uneven than is that of the east. There are no mountains in the State, merely hills and buttes.

The general topography of North Dakota can be best understood by a classification of its rivers and their valleys and watersheds. These are:

(1) The Red River of the North, which forms its eastern boundary and flows into Lake Winnipeg through a valley of rich bottom land 50 to 60 miles wide. The elevation of this valley is about 965 feet in the extreme southwest but gradually descends toward the north. The chief affluents of the Red River are the Shesenne in the south, the Goose in the centre and the Pembina in the north. The Red River is also joined at Grand Forks by the Red Lake River, but this latter river does not otherwise flow within the State.

(2) The Dakota or James River (French, "Riviere de Jacques"), which is to be found in the southern part of the State, and half way between the Red and the Missouri rivers. This is probably the longest unnavigable river in North America, and flows 600 miles from the central plateau through South Dakota and North Dakota until it joins with the Missouri. Its valley constitutes one of the most noted artesian districts on the continent and beneath it is a layer of Dakota sandstone.

(3) The Mouse or Souris River in the north and west of the centre of the State. This river flows south by east down from Canada and sweeping around in a great loop runs north into Canada again and joins the Assiniboine.

(4) The Missouri, which has a navigable course of about 300 miles in the State. Its coteau or plateau which is a stony upland, separates its bed from that of the Dakota or James, and is dotted with small alkaline lakes.

(5) The Little Missouri, which runs north and south in the extreme western triangle of the State and then turns east for another 100 miles to join the Missouri.

(6) The Cannon Ball, the Heart, and the Knife, which flow into the Missouri from the west and which are also to be found in the southwestern triangle. This triangle is a country of broad valleys and scattered buttes.

Geology.—A Cretaceous deposit overlies the greater portion of the State and often to a great depth. This fact makes a study of the older formations exceedingly difficult. Deposits of the Laramie-transition period are found in the western part of the State, while in the Bad Lands (q.v.) tertiary formations are frequently found. The Red River Valley is doubtless underlain by rocks of the Archean Age, the formation being characterized by granite, gneiss and schists. This floor is, however, probably overlaid by Cambrian Sandstone over a considerable part of its area, and in places by a thin layer of Silurian Limestone. The Cretaceous formations which are represented are the Fox Hills, Pierre, Niobrara, Benton and Dakota. The Dakota is mainly a sand deposit which has become more or less hardened, and underlies the upper Cretaceous and Drift throughout the greater part of the State, being comparatively thin in the eastern part, but increasing in thickness toward the central and western parts. The hardened Dakota or Dakota sandstone contains a large proportion of quartz and mica. The Ben-

ton and Niobrara formations are well developed in the central and northern part of the State, but seldom appear along the eastern border. They are principally composed of blue clays and shales, and immediately overlie the Dakota sandstone. The Pierre group is found throughout the centre of North Dakota and its debris forms much of the soil and subsoil and of the glacial deposits which are scattered over the eastern half. The Pembina Mountains, so called, are merely an eroded edge of this formation, and it is also everywhere found in the Turtle Mountain region. The Fox Hills group is to be found almost entirely under the Laramie and later deposits in the western part of the State, and, in portions of the Turtle Mountains and near Dickinson in Stark County, develops into an excellent building stone. The Laramie and its overlying Tertiary extend over a large portion of North Dakota west of the Missouri River. It consists principally of clays and shales, some of which are of great value for brick and pottery uses. In the same formation also are found immense beds of lignite coal. In addition to these deposits is the so-called Drift which is mainly to be found east of the Missouri River. This drift is composed of sand and clay mingled with gravel and boulders, and is merely the rock refuse which was carried along by and created by the glaciers of the past and which was deposited as the ice melted. It, however, has formed a soil which is of great depth and of great fertility.

Minerals.—About 32,000 square miles of the western portion of North Dakota are underlaid with lignite or half-made coal. The total production of this coal is hard to estimate as it is so abundant that the farmers often dig their own supplies from the hillsides. It is safe to say, however, that the annual output is at least 1,250,000 tons, and the government geologists estimate that the total deposits of the State are equal in heat units to the present total consumption of the United States for 99 years.

Lignite is a free burner and an excellent gas coal, and the cheap fuel to be derived therefrom is destined to be of great value not merely for household and heating purposes but in the development of manufacturing centres, which are certain to arise. Together with the coal, indeed, and in the same areas, are to be found valuable and inexhaustible deposits of various kinds of clay which are of the highest grade and capable of almost any brick and pottery use. There have also been found scattered throughout the Bad Lands, large quantities of paint rocks, of various colors, which only need the addition of oil or water for use. Antimony is also found in varying quantities. Natural gas is also found in more or less extended areas throughout the State.

There is in North Dakota comparatively little building stone that may be quarried, but large boulders are scattered everywhere throughout the western area. There is also limestone of excellent quality, as well as large quantities of cement material and glass sand.

Flora and Fauna.—The forested area of North Dakota is very small, and is mainly to be found in the Pembina, Turtle Mountains and the Devils Lake regions, where grow oak and ash, poplar and birch, willow and boxelder, plum and bullcherry and other deciduous trees.

Along the Missouri are large cottonwoods and along the Red River some elm. The characteristic wild animals are timber and prairie wolves, panthers and wild cats, gophers, prairie dogs and deer. Trappers also find otter, mink, beaver, raccoon and badger. Sportsmen shoot much grouse, prairie chicken, wild geese and wild ducks.

Climate and Rainfall.—The mean annual temperature for the State is 39° F. At Bismarck, in the south centre, it is 4° in January and 67° in July, with extremes of -44° and 106°. At Williston, in the extreme northwest, the extremes are -49° and 107°. The dryness of the atmosphere makes these great extremes not only bearable but healthful. The average annual precipitation for the whole State is about 17 inches, and decreases from 20 inches in the Red River Valley to 14 inches in the extreme west. As only 2 per cent of this, however, falls in the winter months, not only are the needs of agriculture fairly subserved but the suffering incident to humid cold is not present, and the winters, though cold, are healthful and stimulating.

Soils and Agriculture.—Few States in the Union have a larger percentage of tillable land than has North Dakota, and though the character of the soil, the climatic conditions and the rainfall vary to a greater or lesser extent over its vast expanse, there are but small areas which are not marvelously fertile. Even the so-called Bad Lands from an economic standpoint are bad only in that they are broken and difficult to travel, and the richness of their valleys and the abundance of the coal, clay, argillaceous limestone and glass sand deposits there to be found more than counterbalance any drawbacks which may come from difficulties of road building. The soil is no doubt the richest in the Red River Valley, which is a wonderful bottom land where a black rich top soil of decayed vegetation overlies alluvium and glacial drift to a great depth and down to a clay subsoil which is itself rich farming ground. The marvelous fertility of this region, its ease of cultivation and its freedom from rocks and stones, for many years prevented a proper appreciation of the western area of the State, but there the mineral resources and climatic conditions are more to be desired and the agricultural possibilities, though at first less apparent, are almost as great. The soil in the western portion of North Dakota, indeed, though thinner than in the Red River Valley, is almost everywhere rich in the elements of plant growth, and, though more sandy, is on that account more friable and quicker. The climate, too, in the trans-Missouri region is perceptibly warmer than in the northeastern portions of the State, and this fact is of great importance, especially to the maturity of corn which is now an established crop.

Perhaps, indeed, in no other State is the Creator's marvelous policy of compensation better illustrated than in North Dakota. The seasons for instance are comparatively short, but the days are proportionately long, and the hours of sunshine in the growing months of April, May, June, July and August are unusually high. During these months the total number of hours of possible sunshine at Springfield, Ill., is 2,174, while the number at Bismarck, North Dakota, is 2,269, and this fact is augmented by

the rapidity with which the atmosphere clears after rainstorms. So, too, though the weather is severe in the winter, the frost often goes from six to eight feet beneath the surface of the ground, thus preserving the moisture which, during the growing months, gradually thaws and rises to the surface and feeds the crops during periods when the rainfall might otherwise be inadequate. Not only is this so, but the cold and extreme depth of frost over the great snowless plains (for on account of the rarity of the atmosphere North Dakota is comparatively free from snow), destroy countless millions of the larvæ and eggs of the predatory worms and insects. Though the average rainfall decreases toward the western portions of the State, the data of many years has shown that all but 2 per cent of this rainfall falls during the growing season, and if properly conserved is adequate to the needs of diversified farming.

Crops.—The greatest crop of North Dakota is wheat, of which she raised in 1915 no less than 155,845,963 bushels, and for which her farmers received the sum of \$135,585,988. This sum, however, represents but a little over one-half of what was received for other agricultural products, the total being \$226,218,053, and being made up as follows: Wheat, 155,845,963 bushels, value \$135,585,988; oats, 102,856,040 bushels, value \$27,711,131; barley, 57,331,328 bushels, value \$25,225,784; rye, 3,675,165 bushels, value \$2,903,380; flax, 5,233,071 bushels, value \$9,314,866; speltz, 2,744,160 bushels, value \$1,042,781; potatoes, 7,775,910 bushels, value \$3,188,123; corn, 11,120,872 bushels, value \$7,450,984; tame hay, 527,002 tons, value \$4,216,016; wild hay, 1,670,000 tons, value \$9,519,000.

The chief crops, with their acreage, yield and value in 1922 were: corn, 680,000 acres, 18,700,000 bushels, \$9,350,000; wheat, 8,740,000 acres, 123,234,000 bushels, \$110,911,000; barley, 1,008,000 acres, 25,704,000 bushels, \$10,025,000; oats, 2,388,000 acres, 78,804,000 bushels, \$20,489,000; rye, 1,581,000 acres, 24,506,000 bushels, \$14,704,000; tame hay, 1,028,000 acres, 1,655,000 tons, \$12,412,000; potatoes, 198,000 acres, 17,820,000 bushels, \$5,524,000. On 1 Jan. 1923 there were in the State 797,000 horses, valued at \$44,632,000; 8,000 mules, valued at \$552,000; 503,000 milk cows, valued at \$22,132,000; 814,000 other cattle, valued at \$17,420,000; 240,000 sheep, valued at \$1,752,000, and 478,000 swine, valued at \$6,453,000.

Manufactures.—The enormous coal deposits and their close proximity to the fine pottery clays, which are to be found in inexhaustible quantities in the western part of the State, are destined in the near future to make a manufacturing centre of that region. At the present time, however, agriculture and cattle raising are the paramount industries and, with the exception of flour, creamery products, fire and pressed bricks, harnesses and candies, the factories of the State may be generally termed neighborhood manufactures. Of flour mills there are upwards of 87, with annual products valued at \$29,282,000. In 1919, 57 butter-making establishments turned out products valued at \$11,122,000. Cars and general shop construction, including repairs by railroads, amounted to \$3,183,000. There are numerous brick plants and potteries, the largest of which are at Hebron and Dickinson, and whose pressed brick is marketed as far west as the Pacific Coast.

In 1919, the capital invested in manufactures was \$24,549,838, and the value of the products was \$57,373,622.

Banks and Banking.—All private banks are compelled by law to take out charters as State banks. In 1922, there were 660 State banks and 183 National banks, carrying total deposits of about \$156,000,000. In addition to these institutions there were numerous building and loan associations, trust companies and other similar institutions.

Transportation.—The Missouri River is navigable throughout its length but needs a clever pilot. The Red River is navigable from Fargo to Winnipeg, but boats run only from Grand Forks. The total railroad mileage is 6,281 miles. There are three principal railroad systems and several small local lines. The principal systems are the Great Northern, the Northern Pacific and the Minneapolis, Saint Paul and Sault Sainte Marie. The two former cross the entire State from east to west, the first mostly north of the parallel of 48°, and the latter a little south of the parallel of 47°. The Minneapolis, Saint Paul and Sault Sainte Marie cuts the State diagonally through its centre and connects with the Canadian Pacific at the northern boundary. The Chicago and Saint Paul and the Chicago and Northwestern railroads also enter the State with short branches in the south. All of these roads have numerous branch lines.

Education.—The public schools have a land endowment valued at \$64,000,000. One-eighteenth of the lands of the State were reserved for their use in the outset by the constitution, making 2,531,200 acres. In addition to this some 500,000 acres were reserved for the support of the technical schools and schools of higher education and for the support of the charitable institutions. There were also set aside 50,000 acres for the use of the State capital. None of these lands may be sold for less than \$10 an acre, and the State is obliged to make good any shortages.

In 1920-21 \$13,306,724, was expended for the support of the public schools. Of these there were 5,650 employing 7,350 teachers, and possessing sites and buildings of a value of \$14,736,247. There are in addition to these schools the following institutions for higher and special education: an agricultural college at Fargo, State University at Grand Forks, with a School of Mines in connection, State Normal Schools at Valley City, Mayville and Minot, a Normal and Industrial School at Ellendale, a School of Forestry at Bottineau and a Scientific School at Wahpeton. There are also numerous agricultural experiment stations scattered through and supported by the State, and a large experiment and tree distributing station at Mandan, which is supported entirely by the Federal government.

There is a college at Fargo, which was founded in 1887 by the Congregationalists, but which is now nonsectarian, a Methodist college at Grand Forks, which is affiliated with the State University, a Presbyterian college at Jamestown and a number of academies and parochial schools. The State also maintains a legislative reference bureau and an educational reference department. During 1915, the latter department ministered to the needs of

some 275 towns and answered the correspondence of 12,000 people. There are also 283 traveling libraries and 1,047 library stations. Three hundred and forty-four newspapers are published within the State.

Religion.—The Catholic population of the State is estimated to be nearly 96,000. The Methodist is about 13,500, the Baptist about 6,300, the Protestant Episcopal about 2,500, the Presbyterian 9,300, the Congregational 9,000, and the Lutheran about 72,100. There are probably 4,000 Jews in the State and about 150 synagogue families.

Charitable and Penal Institutions.—There is a soldiers' home at Lisbon, an asylum for the blind at Grafton, a school for the deaf at Devils Lake, a hospital for the insane at Jamestown, a sanitarium for tuberculosis at Dunseith, a reform school at Mandan, and a penitentiary at Bismarck.

Finances.—The assessed valuation of all property, both real and personal, in the State in 1922 was \$1,300,000,000. The real value of the State, however, is probably in the neighborhood of \$2,000,000,000, the assessments being based on a low percentage. Taxation for State purposes is limited to four mills, exclusive of the interest on the bonded debt. Local indebtedness may not exceed 5 per cent of the assessed valuation of the local property, although incorporated cities may, by special vote, increase this limit. On 1 July 1921 the State had on hand a balance of \$3,054,390.17. Receipts during the fiscal year 1921-22 amounted to \$14,762,853.87. Disbursements for the same period totaled \$15,411,760.94, leaving a balance on hand on 1 July 1922 amounting to \$2,405,483.10. The bonded debt of the State on the latter date was \$7,048,200.

Population and Civil Divisions.—In 1880 the population of North Dakota, which then constituted the northern half of the territory of Dakota, was 36,305, excluding Indians. It is 646,872, including 6,254 Indians, and the school census of 1920 was 233,065. Of the total population 66.7 per cent are either foreign born or of foreign descent. About 25 different nationalities are represented. There are probably 100,000 Norwegians, 60,000 German Russians, and there are also large settlements of Canadians, Icelanders, Swedes, Danes, Austrians, Irish, English, Hungarians, Scotch, Hebrews, French, Welsh, Bohemians, Dutch, Bulgarians, Greeks, Turks, Finns, Estonian and Italians.

There are no large cities in the State, and there is only one with a population which reaches 20,000—Fargo (21,961). There are, however, a number of thriving small ones, of which Grand Forks is the largest, having a population of 14,010. The next largest is Minot, with a population of 10,476. Then follows Bismarck with a population of about 7,000 and Dickinson, Jamestown and Valley City, and Devils Lake, all of which have over 5,000 people. Then a number of towns having a population of less than 5,000, but more than 1,000, and a still larger number of small villages. The Indians number about 6,250, and are found on four reservations, Standing Rock, Fort Berthold, Devils Lake and Turtle Mountain. There is a military post at Fort Lincoln near Bismarck, and another at Devils Lake. The State has 53 counties, which with their county seats are:

County	County seat	County	County seat
Adams.....	Hettinger.....	McHenry....	Towner.....

State Government.—The governor is elected for two years. The State officers are elected in November of the even numbered years. The legislature is composed of a senate, whose members are chosen for four years, and a house of representatives, whose members are chosen for two. It meets biennially and its sessions are limited to sixty days. The Judicial Department consists of a Supreme Court, of five members holding office for six years, twelve district judges, holding office for four years, the county judges and justices of the peace. Some of the county judges are given general jurisdiction to a limited amount. Under the new apportionment three representatives are sent to Congress. The constitution makes it a misdemeanor for anyone to interfere with another's obtaining, or enjoying after having obtained, employment from anyone. It also provides for the prohibition of the liquor traffic. Residence in the State for one year is required before an application for a divorce will be entertained and the grounds therefor merely include adultery, cruelty, desertion, habitual drunkenness, incurable insanity and conviction of a felony. The Initiative and Referendum are both in use and on both constitutional and statutory provisions. A system of primary election for all public officers also prevails. Even before the adoption of the 19th amendment women voted in school elections and for non-constitutional officers.

* Died in office.

History.—The old Territory of Dakota took its name from the Dakotas (allies), another name for the Sioux Confederation. Lewis and Clark wintered at Mandan and were at the mouth of the Yellowstone in 1804. In

1810 Lord Selkirk built a fort at Pembina, supposing the territory to be a part of his purchase from the Hudson's Bay Company. The first steamer ascended the Missouri in 1830. Fremont in his explorations penetrated to Devils Lake in 1839. In 1832 George Catlin was here and painted some of his famous Indian portraits. The first purchases of land from the Sioux were made in 1851. In 1857 the first settlement in the Dakotas was made at Sioux Falls in South Dakota.

That part of North Dakota which lies south of the Pembina River was originally a part of the Louisiana Purchase. That part which lies north was conveyed in 1809 by the Hudson's Bay Company to Lord Selkirk and was brought into the United States by the location of the boundary at the 49th parallel in 1811. In December 1912 that portion of the original purchase which lay north of the 33d parallel and which extended to the international boundary was formed into the Territory of Missouri. In 1834 the Territory of Michigan was created and in it was included all of the country east of the Missouri River and north of the States of Missouri and Illinois. North Dakota and South Dakota were contained therein. In 1837 Michigan was admitted as a State and the remaining territory was termed Wisconsin. In 1838 North and South Dakota were taken from the Territory of Wisconsin and added to the Territory of Iowa, which also included Minnesota. In 1849 the eastern part of the Dakotas was merged into the newly created Territory of Minnesota, while in 1854 that part which lay west of the river was included in the Territory of Nebraska. In 1858 Minnesota was admitted into the Union and for a time that portion of the Dakotas which lay east of the Missouri River was unprovided for. This continued until 2 March 1861 when the Territory of Dakota was created and which included not only the Dakotas but Montana, Wyoming and a part of Idaho. From this area Montana was separated in 1873 and on 3 Nov. 1889 the present States of North and South Dakota were given their present boundaries and admitted into the Union.

With the exception of the years 1892 and 1912 North Dakota has always elected a Republican national ticket. It has, however, always been extremely progressive in its policies and was the first State in the Union to hold a preferential primary for the presidency of the United States. This was in 1912. It adopted a primary system in 1905 and the 1916 elections show a complete victory for an agrarian movement which advocates State-owned packing houses, flour mills, terminal grain elevators, State grain inspection and compulsory State hail insurance, a largely extended rural credit system, a State owned bank and the exemption of farm improvements and farm personal property from taxation. The woman's suffrage movement was very pronounced in the State.

ANDREW A. BRUCE,
Chief Justice of Supreme Court of North Dakota.

NORTH DAKOTA, State University of. The State University and School of Mines of North Dakota is located at Grand Forks. It was established by an act of the Territorial legislature approved 27 Feb. 1883. The fol-

lowing colleges or departments have thus far been organized: The College of Law, granting the degree of LL.B.; The College of Liberal Arts, granting the degrees of B.A. and M.A.; The College of Mechanical and Electrical Engineering, granting the degrees of M.E. and E.E. The College of Mining Engineering, granting the degree of E.M.; The Normal College; the School of Commerce; the School of Mines and the School of Pharmacy. The plant of the University consists of eight substantial buildings heated by steam and lighted by electricity. The University has received as a grant from the Federal government 126,080 acres of land which, under the terms of the grant and of the State constitution, may not be sold for less than \$10 an acre. It is probable that this grant will eventually yield a fund of not less than \$2,000,000. The University is maintained by an annual fixed appropriation of two-fifths of a mill on the dollar of the assessed valuation of the State for purposes of taxation. The total income of the University for the year 1922-23 was approximately \$552,300. The University owns, exclusive of its lands, property valued at \$1,575,000. Its library numbers 30,000 volumes. A public health laboratory, a weather bureau station and a station of the Geological Survey are maintained here. A mining substation is located at Hebron and a biological station at Devils Lake.

NORTH DAKOTA AGRICULTURAL COLLEGE, opened in 1891, at Fargo. The regular four years courses include agriculture, general science and mechanical engineering; the shorter courses are agriculture and steam engineering, two years, and a "farm school" of three months; there are also courses in domestic science, military science, literature and science, pharmacy, veterinary science, surgery. The college is open to women and there are women on the faculty. The campus includes 640 acres; a new sewerage system connecting all buildings and grounds with the main sewer of Fargo was completed in 1901. The income is derived mainly from State and Federal appropriations. The college organizes farmers' institutes in all parts of the State, under the supervision of the faculty. The faculty in 1917 numbered 85 and the students 918, of whom about 450 were women. The college grounds and buildings are valued at \$250,000. The annual income is about \$230,000. There are 25,000 volumes in the library.

NORTH DOWNS. See DOWNS.

NORTH FORELAND, för'länd. See FORELANDS, NORTH AND SOUTH.

NORTH GERMAN CONFEDERATION, the union of German States in 1866 under the leadership of Prussia. See GERMAN.

NORTH ISLAND. See NEW ZEALAND.

NORTH KINGSTOWN, R. I., town in Washington County, 23 miles south of Providence, on the New England Navigation Company Line. It is famous for its buildings such as the Old Narragansett Church built in 1707 and Smith's blockhouse built in 1638. There is also an Indian graveyard. Pop. 3,397.

NORTH LITTLE ROCK, Ark. See ARGENTA.

NORTH PLAINFIELD, N. J., borough in Somerset County, 24 miles west of Jersey City and 28 miles west of New York City, on the Central Railroad of New Jersey. Here are situated Mount Saint Mary's College and Herbert's Hall for Exceptional Children. In the neighboring county are stone-quarries, large orchards, stock-farms and dairies. The town's industries are chiefly fruit canneries, bottling works, a woodworking factory and a factory for telescopes. Tourists visit Washington Rock, Elsinore Castle and Wetumpka Falls. Pop. 6,916.

NORTH PLATTE, Neb., town, county-seat of Lincoln County, at the confluence of the North and South Platte rivers and a division point of the Union Pacific Railroad, about 225 miles direct west of Lincoln, capital of the State, on the Lincoln Highway. It is in a productive agricultural region where irrigation has been introduced. Considerable attention is given to stock-raising and the county fair held at North Platte each year is one of the best in the State. Cattle, sugar beets and alfalfa are exported. The Union Pacific Railroad has machine shops here and the roundhouse is the second largest on the system. The payroll averages \$60,000 a month. It has grain elevators, cold storage plant, stock, brick, lumber and coal yards. The school facilities are among the best in the State; in addition to the high school is a junior high school. The United States Land Office is located in the Federal building; also the United States Weather Bureau headquarters and State experimental station. There is a well-equipped Carnegie Library and an active chamber of commerce. The waterworks are municipal property. Pop. 10,466.

NORTH POLE. See ARCTIC REGION; POLAR RESEARCH.

NORTH PROVIDENCE, R. I., town and county-seat of Providence County, five miles northwest of Providence, of which it is a suburb. It is situated on the New York, New Haven and Hartford Railroad. The town owns a public library. The chief factories make woolen goods. Pop. (1920) 7,697.

NORTH RIVER, the name given to the lower course of the Hudson River. This name was applied in the early days when the Delaware was called the South River. See HUDSON RIVER.

NORTH SEA, or GERMAN OCEAN, a northeastern extension of the Atlantic Ocean lying between Great Britain and the continent of Europe; lat. 51° to 61° N.; long. 2° 30' W. to 7° 30' E.: Great Britain with the Orkney and Shetland islands being on the west; Denmark and part of Norway on the east; Strait of Dover, part of France, Belgium, Holland and Germany on the south; and the Arctic Ocean on the north. Extreme length, from the Strait of Dover to Unst, the most northern of the Shetland Isles, about 700 miles; greatest breadth, between Haddingtonshire, Scotland, and Denmark, about 420 miles; area, over 190,000 square miles. The shores of all the countries that surround the North Sea are deeply indented with bays, fiords, inlets and large estuaries; but its most remarkable arm is the Skager Rack,

between Denmark and Norway, which communicates through the Kattegat with the Baltic Sea. The North Sea is deepest on the Norwegian side, where the soundings give 190 fathoms; but the mean depth of the whole basin may be stated at no more than 31 fathoms. The bed of this sea is traversed by several enormous banks, one of which trends from the Firth of Forth, Scotland, in a northeasterly direction, to a distance of 110 miles; others run from Denmark and Jutland upward of 105 miles to the northwest; while the greatest of all, the Dogger Bank, occupies the centre of the sea, from lat. 54° 10' to 57° 24' N. and long. 1° to 6° 7' E. The great oceanic tidal wave which originates in the Atlantic, after having swept the west coasts of Great Britain and Ireland, enters the northern extremity of the North Sea, giving high water nearly simultaneously to the opposite shores of Scotland and Norway. Pursuing its course along the coasts of the former and of England, it rules the tides as far south as the Thames, making the tour of Great Britain in 18 hours. On entering the North Sea, on the north of Scotland, the tidal wave does not exceed 12 feet; but gradually increases to 14, 16, 18 and in the Humber to 20 feet; a difference of height depending on the figure of the shore, the form of the bottom and the direction of incidence of the wave. Three other currents enter the North Sea—the Polar, the Baltic and the Mediterranean currents. The fisheries are the most productive of the world and are specially valuable on the Dogger Bank, on all the shores that bound it, and in the direction of the Orkney and Shetland Isles. Among important rivers draining into it are the Thames, Humber and Forth, the Elbe, Weser, Ems, Rhine, Meuse and Scheldt. The Kaiser Wilhelm Canal affords an entrance into the Baltic without going round Jutland. The North Sea has been from the earliest times one of the most important highways of the world. Consult Mackinder, 'Britain and the British Seas' (1902).

NORTH SMITHFIELD, R. I., town in Providence County, six miles from Woonsocket, on the New York, New Haven and Hartford Railroad. The chief industry is bleaching. Pop. 2,699.

NORTH STAR, in astronomy, the north polar star, of the constellation Ursa Minor, also called Polaris. See URSA MAJOR.

NORTH STAR, ORDER OF. See ORDERS AND DECORATIONS OF HONOR.

NORTH SYDNEY, Canada, town and port of entry, Cape Breton Island and County, province of Nova Scotia, on the northern side of Sydney Harbor, five miles north-northwest of Sydney, and on the Intercolonial Railroad. Coal is mined in large quantities and there are large shipping interests besides some smaller manufactures. It is the general shipping point for farm products and general merchandise going into Newfoundland. Steamers also connect with Saint Lawrence River ports and Charlottetown, a ferry with Sydney, and the Sydney mines with electric railroad. Besides the public schools, Saint Joseph's Academy (Catholic) is located there. The town was first settled in 1792 by Loyalists. Pop. 5,418.

NORTH TARRYTOWN, N. Y., village in Westchester County, 26 miles north of New York on the east bank of the Hudson River and on the New York Central and Hudson River Railroad. It joins Tarrytown and is near Sleepy Hollow, made famous by Washington Irving's 'Legend of Sleepy Hollow.' The Old Dutch Church, erected in 1699, still holds its congregation. In the Sleepy Hollow Cemetery are the graves of Washington Irving, Paul Leicester Ford, Carl Schurz and many representatives of old Knickerbocker families. North Tarrytown manufactures silk and automobiles. Pop. (1920) 5,927.

NORTH TONAWANDA, tön-a-wön'da, N. Y., city in Niagara County, at the confluence of Niagara River and Tonawanda Creek, on the Erie Canal and on the New York Central, the Erie and the Lehigh Valley railroads, opposite Tonawanda, and five miles above Buffalo. Several other railroads, using leased tracks, and electric lines connect the city with Buffalo, Niagara Falls and other places. North Tonawanda is in an agricultural region, but the city is noted for its manufacturing and commercial interests. It has large lumber yards, and the chief manufactures are steam pumps, merry-go-rounds, pig iron, bolts, nuts, structural steel, concrete blocks, gasoline motors, automatic organs, steam radiators, pumps, motor boats, toy railroads, steam piping and a variety of lumber products. The industries represent an invested capital of \$10,000,000, and an annual product worth \$12,000,000. The public library has about 6,000 volumes. The charter of 1897 provides that the government shall be vested in a mayor, who holds office two years, and a council consisting of two members from each ward, and three at large. The city owns and operates the waterworks. Pop. (1920) 15,482.

NORTH VANCOUVER, Canada, city in British Columbia, on the north shore of Burrard Inlet and opposite the city of Vancouver, to which it is connected by ferry, bridge and railroad. A fine boulevard, 150 feet wide, surrounds the city. The magnificent scenery and the fine drives attract many tourists. Nearby are Grouse Mountain (4,350 feet), the Crown (5,600 feet) and the Lions (6,500 feet). The industrial establishments include shipbuilding, doors, sashes, awnings, furniture and cigar factories and numerous lumber mills. Pop. 9,987.

NORTH VERNON, Ind., city and county-seat of Jennings County, 65 miles southeast of Indianapolis and 21 miles southeast of Columbus, on the Baltimore and Ohio Southwestern, the Pittsburgh, Cincinnati, Chicago and Saint Louis and the Cleveland, Cincinnati, Chicago and Saint Louis railroads. It is situated in a fine agricultural district. North Vernon possesses an electric-light plant and waterworks, flour mills, lumber mills and factories producing glass-chimneys, lawn swings, snakes and wood brackets. Pop. (1920) 3,084.

NORTH YAKIMA, Wash., city and county-seat of Yakima County, 157 miles southeast of Seattle, on the Northern Pacific, the Yakima Valley Traction and the Oregon-Washington Railroad and Navigation systems. It is situated on the Yakima River in a rich agricultural and fruit-growing region. The industries are chiefly livestock, dairy-farms, fruit

canneries, flour, saw and lumber mills and cold-storage houses. The town has a Carnegie Library, a fine hospital, Federal and high-school buildings. The commission form of government has been adopted. Pop. 18,539.

NORTHAMPTON, north-äampton, England, a parliamentary and county borough, capital of the county of the same name, 66 miles northwest of London by rail, on the left bank of the Nen, and on the London and North-western and Midland railroads. The principal buildings are the town hall, the shire or county hall, the county and borough jails, corn exchange, barracks, infirmary, theatre, etc. There are a free library, museum, schools of science and art, grammar school, founded in 1552; mechanics' institute, an atheneum and other literary and artistic societies. The benevolent institutions include the infirmary, a lunatic asylum, the Royal Victoria Dispensary, Saint John's and Thomas-a-Becket hospitals, etc. The principal churches are All Saints', founded in 1160, destroyed in the great fire of 1675 and rebuilt by Wren in 1680; Saint Peter's, restored in 1850; Saint Giles', Saint Sepulchre's, dating from the 12th century, and one of the four round churches in England, and the Roman Catholic Cathedral. The staple manufacture is boots and shoes for home and export trade, which employs thousands of hands. The curing of leather is also carried on on a large scale. The races held on a race course north of the town attract great numbers of visitors. Besides two weekly markets there are 11 annual fairs. Northampton, known in Saxon times, was in possession of the Danes from 921 and appears in Domesday Book as Northaneton. It was the meeting place of several parliaments; and here the treaty of Northampton was signed in 1328, guaranteeing the independence of Scotland. In the vicinity Henry VI was defeated in battle by the Yorkists and taken prisoner (10 July 1460). The city was held for the parliament during the Great Civil War. There are interesting Romano-British remains. Consult Adkins, 'Northampton in English History' (London 1898); Campion, 'Northampton with its Surroundings' (Northampton 1907); and the Victoria County History. Pop. 90,064.

NORTHAMPTON, Mass., city, county-seat of Hampshire County, on the Connecticut River and on the New York, New Haven and Hartford and the Boston and Maine railroads, 18 miles north of Springfield, 109 miles west of Boston and about 140 miles from New York City. The largest part of the city is known as the "Center," and the remainder includes the villages of Bay State, Florence and Leeds. Nearby are Mount Holyoke and Mount Tom, both with electric railroads to the summit. The city is on a height which commands a fine view of the river valley. It was settled 14 May 1654 by English colonists and was named after Northampton in England. Jonathan Edwards (q.v.) lived here for some years. It was incorporated on 18 October of the same year and chartered as a city 1 Jan. 1884. It is in a productive agricultural section, but it has extensive manufacturing and commercial interests. The chief manufacturing establishments are sewing-silk mills, basket and paper box factories, lumber mills, brush factory, hardware

works, hosiery mills, sewing-machine and furniture factories, machine shops, pulp mills, emery wheel works and foundries. There are about 3,000 employees in the manufactories. The trade is principally in the manufactured articles and farm products. It has a number of fine buildings and prominent institutions, among which are the Dickinson Hospital, the State Asylum for the Insane (700 patients), and the opera house. The last mentioned, a gift from a native of the city, is owned and managed by the municipality. There are a number of fine church buildings. The educational institutions are Smith College (q.v.); the Burnham Classical School for Girls; the Clarke Institute for Deaf-Mutes, endowed by John Clarke; public and parish schools; three public libraries, gifts of natives of Northampton, and the "Home Culture Club," founded by George W. Cable (q.v.), and assisted by a gift of \$50,000 from Andrew Carnegie. The educational advantages of this club have been of great benefit to a large number of men and women; unique features are the instructions in household arts and amusements. The three national banks have a combined capital of \$650,000, and the three savings banks have a total deposit of \$4,975,000. The "Smith Charities" has peculiar features that make it a most remarkable and beneficent institution. It was founded by the will of a public benefactor, who desired to aid a special class of worthy persons. On certain conditions young men and women and widows receive annual gifts of money, young women receive gifts when they marry and young men, who learn a trade, receive a certain sum of money when they attain the age of 21. The charter of 1883 provides for a board of aldermen and a council of 21 members elected annually by the people. The board of education and the trustees of the Forbes Library are chosen by popular vote. The city owns and operates the waterworks and also its own Municipal Theatre. It is a most healthful community and has a live and energetic board of trade. Pop. 21,951. Consult Trumbull, 'History of Northampton.'

NORTHBRIDGE, Mass., town in Worcester County, on the Mumford and the Blackstone rivers and on the New York, New Haven and Hartford Railroad, about 10 miles southeast of Worcester. It was settled in 1662 and remained a part of Mendon until 1772 when it was incorporated as a separate town. It has a public library and a hospital. Its chief manufacturing establishments are large cotton and woolen mills, machine shops, cotton-mill machine works, furniture and cigar factories, embossed paper, silk mills, etc. The government is administered by annual town meetings. The Whitin Machine Works own and operate the town's waterworks. Pop. (1920) 10,174.

NORTHBROOK, Earl of. See **BARING**, THOMAS GEORGE.

NORTHBROOK, 1st BARON. See **BARING**, SIR FRANCIS THORNHILL.

NORTHCLIFFE, 1st BARON (ALFRED CHARLES WILLIAM HARMSWORTH), English journalist and newspaper proprietor: b. Chapelizod, county Dublin, Ireland, 15 July 1865; d. London, 14 Aug. 1922. He established in 1888 a successful weekly, *Answers*, which he nominally continued to edit; in 1894 he acquired the London

Evening News; and in 1896 he founded the *Daily Mail*, the first half-penny morning newspaper to achieve a distinctive success in England and in which American methods were freely borrowed. Journals of the same kind were established by him in other populous centres. In 1908 he secured control of the London *Times*, his most ambitious venture, and from that time he exercised, by means of his powerful syndicate of newspapers, a strong influence on the public life of the country. After the outbreak of the European War he showed himself a keen critic of the British War Office and its methods. In especial, the attacks on Lord Kitchener that were made by his journals in May 1915 aroused widespread resentment which had an immediately adverse effect on his circulations, and he was accused of endeavoring to assume a dictatorship. But it is not to be denied that his criticisms were fruitful of results—in the formation of a Coalition Ministry and the creation of a Ministry of Munitions; in the general enforcement of compulsory service in England and Scotland; and in an improved British aviation service; and that the strictures passed at the inception of the Allied campaign in Gallipoli were borne out by events. Lord Northcliffe's interests were wide and varied; he equipped the Arctic Expedition of 1894 under F. G. Jackson; he was an authority on motor-ing and did much to advance the science of aviation in the United Kingdom. He visited the United States on several occasions; in 1900 he was given charge for one day of a New York daily and produced it as a quarto, the form he considers newspapers should adopt. He was created a baronet in 1904 and was raised to the peerage as Baron Northcliffe in 1905. In 1918 he came to the United States on a special mission connected with the European War.

NORTHCOTE, nōth'kōte, James, English artist: b. Plymouth, England, 22 Oct. 1746; d. London, 13 July 1831. He early showed a taste for drawing and was encouraged to go to London, where he arrived (1771) with a letter of introduction to Sir Joshua Reynolds, under whom he worked for five years. He visited Italy in 1777, where he spent his time in copying the old masters, especially Titian. He returned to London in 1780, and six years later exhibited his first historical work, 'The Young Princes Murdered in the Tower.' He was elected an academician in 1787. Between 1783 and 1831 he exhibited no less than 229 historical paintings, taking subjects from English history or Shakespeare; these are chiefly remarkable for highly effective composition. The faces are Greek, the costumes absurd, the chiaroscuro fantastic and exaggerated, and the coloring inharmonious. His greatest skill is shown as an animal painter. His portraits are uneven, but those of men are better than those of women, while some of his children's and angels' faces are beautiful. This will be seen from his 'Portrait of Sir Simon Taylor'; 'A Dog and a Hawk'; 'Prince Arthur and Hubert'; 'Four Infant Angels in the Clouds.' He painted altogether some 2,000 works. He was the author of a somewhat commonplace memoir of Sir Joshua Reynolds (1813) and a 'Life' of Titian (1830). Consult Gwynn, Stephen, 'Memorials of an 18th Century Painter' (1898).

NORTHCOTE, Sir **Stafford Henry**, 1st EARL OF IDDESLEIGH, English statesman: b. London, 27 Oct. 1818; d. there, 12 Jan. 1887. He was educated at Eton and at Balliol College, Oxford, became private secretary to Gladstone in 1843; was called to the bar in 1847, and in 1851 succeeded his grandfather in the baronetcy. He sat in Parliament in 1855 for Dudley, in 1858 was elected member for Stamford, and in 1866 for North Devon, which he represented till 1885. In 1862 he published 'Twenty Years of Financial Policy.' In 1866 he became president of the Board of Trade; and 1867-78 was secretary for India. He was chairman of the Hudson's Bay Company 1869-74, and during the critical period of the company's transfer of Prince Rupert Land to the Canadian government visited Canada in its interests. In 1871 he was a member of the high joint commission which arranged the Treaty of Washington; and in 1874-80 was chancellor of the exchequer in the Cabinet of Disraeli. After the Liberals returned to power in 1880 he became Conservative leader in the Commons and as such assisted in effecting the compromise on the Franchise Bill of 1874. In 1885 he was practically superseded to make way for Lord Randolph Churchill, and in the short Salisbury administration of that year was appointed to the nominal office of first lord of the treasury and raised to the peerage. In the second Salisbury government (1886), he held the office of foreign secretary. Consult his published 'Letters and Essays' (1887); Lang, 'Life, Letters and Diaries of Stafford Northcote' (1890).

NORTHEAST, Pa., borough in Erie County, 14 miles northeast of Erie on the New York Central, Lake Shore and Michigan Southern and New York, Chicago and Saint Louis railroads. A Roman Catholic College (Saint Mary's) is situated here. The town has municipal waterworks. Fruit growing is the chief industry; but there are manufactures of grape-juice, canned goods, wines, wooden novelties, baskets, crates, flour, lumber, foundry products and copper. Pop. (1920) 3,481.

NORTHEAST BOUNDARY. See BOUNDARIES OF THE UNITED STATES.

NORTHEAST BOUNDARY DISPUTE, the disagreement between the United States and Great Britain from 1783 to 1842 respecting the northeast frontier. The Treaty of 1783 defined the northeast boundary of the United States, toward Canada, as extending from the source of the Saint Croix due north to the highlands or watershed between the Atlantic and Saint Lawrence systems, thence along those highlands to the northwesternmost head of the Connecticut River. Disputes arising over this definition, an arbitration treaty was signed in 1827, and in 1831 the King of the Netherlands, as arbitrator, made an award to which the American Senate withheld assent. Fresh negotiations were undertaken; friction took place in the disputed territory culminating in the "Aroostook War" (1839); and finally, by the Webster-Ashburton Treaty of 1842, the present line was agreed upon, not greatly differing from that suggested by the Dutch king, and giving about seven-twelfths of the disputed territory (extending in total to 12,027 square miles) to the United States and about five-twelfths to Great Britain.

It was reckoned, however, that in value the area awarded to the United States was equal to four-fifths of the whole. Consult Mr. James White's contribution in 'Canada and Its Provinces' (Vol. VIII, pp. 779-826; Toronto 1914). See BOUNDARIES OF THE UNITED STATES.

NORTHERN, nōr'tēn, **Adolph**, German painter: b. Münden, Prussia, 6 Nov. 1828; d. Düsseldorf, 28 May 1876. He was a pupil in the Düsseldorf Academy from 1847 to 1851, when he devoted himself to the delineation of soldier life and battle scenes. In 1852 he began a series of pictures illustrating the wars of Napoleon I. These included 'The Battle of Waterloo' (1855); and 'The Retreat of the Grand Army.' To these he added scenes from the war with Denmark, and from the German-Austrian war 1866. His series portraying the last Franco-Prussian war includes 'The Storming of Weinberg'; 'The Transport of French Prisoners'; and 'The Charge of the 16th Uhlan on a Square.'

NORTHER. See COLD WAVE.

NORTHERN BAPTISTS, the name given to describe the members of the Baptist denomination who live in the northern part of the United States to distinguish them from the Southern Baptists dwelling in the Southern States. The Northern Baptist Convention, a semi-official body, organized in 1907, administers their various activities, such as missions, etc.

NORTHERN BEAR, in international politics, a name often applied to Russia.

NORTHERN BOUNDARY. See BOUNDARIES OF THE UNITED STATES.

NORTHERN DRIFT, in geology, an obsolete name for the boulder-clay of the Pleistocene Period. The deposits were popularly supposed to have been brought by the polar currents from the far North.

NORTHERN GIANT, a name applied formerly in Europe to Russia, alluding to its size, growth and population.

NORTHERN LIGHTS. See AURORA BOREALIS.

NORTHERN MYTHOLOGY. See MYTHOLOGY.

NORTHERN SECURITIES CASE, an important case decided by the United States Supreme Court in 1903. The Northern Securities Company was a corporation organized to take over the stock and the control of the Northern Pacific and the Great Northern railway companies. The question brought before the Supreme Court under the Sherman Anti-trust Law of 1890 was whether the transaction constituted a "contract combination—or conspiracy in restraint of interstate or foreign trade or commerce." (Northern Securities Company v. United States, 193 U. S. 197). The combination was declared to be illegal. The constitutionality of the Act was then questioned; but the court decided that Congress had the power to enact it; and the Northern Securities Company was enjoined from exercising any rights of ownership or control in or

over the stock of the two subsidiary companies. Consult Canfield, 'The Northern Securities Decision and the Sherman Anti-Trust Act' (in *Columbia Law Review*, Vol. IV, New York 1904); Meyer, B. H., 'History of the Northern Securities Case' (Madison 1906); and Coudert, F. R., 'Certainty and Justice' (New York 1913).

NORTHERN TERRITORY. See AUSTRALIA.

NORTHFIELD, Mass., in Franklin County, one of the oldest towns in the Connecticut Valley. Its early history is connected with the French and Indian wars, and it is the most northern town in Massachusetts, located on both sides of the Connecticut River, midway between Greenfield, Mass., and Brattleboro, Vt., and on the Central Vermont Railroad. The town is in an agricultural region and contains some of the very best land in the Connecticut Valley. Its broad macadamized main street over two miles in length, with its four rows of beautiful large elm trees, set out in 1815 by Thomas Power, are the admiration of all visitors. It is famous as a centre of religious training. It is the birthplace of Dwight Lyman Moody and was his home and the scene of much of his work. The annual conferences of Christian workers and of students are held here during the summer. The Young Ladies Seminary, founded by D. L. Moody in 1879, is located here and the Mount Hermon School for boys, founded in 1881, in the adjacent town of Gill is connected with the Northfield educational work. The government is administered by town meetings. Its population 1,781, not including the seminary students.

NORTHFIELD, Minn., city in Rice County, on the Cannon River, and on the Chicago Great Western and the Chicago, Minneapolis and Saint Paul and Rock Island railroads; also on the Dan Patch Electric Line. It was settled in 1856 and in 1875 was chartered as a city. It is situated in an exceedingly fertile agricultural section in which dairying is the principal industry. It is the largest Holstein-Friesian cattle community in the country. It is the seat of Carleton College opened in 1866 by the Congregational Church but non-sectarian in teaching, an institution of 70 teachers, about 850 students and \$1,700,000 endowment. It is the home of Saint Olaf College founded in 1875 under the auspices of the United Lutheran Church, and now has over 928 students. The Scoville library and the Goodsell observatory are part of Carleton College. There is a Carnegie library and one of the best high schools in the State. It has the Odd Fellows Home, a community building, nine churches, electric power, gas, municipal waterworks and public baths. Northfield was settled in 1856 and is governed under a city charter of 1875 which provides for a mayor, elected biennially, and a unicameral council. Pop. (excluding students) 4,023.

NORTHFIELD, Vt., town, including a village of the same name, in Washington County, on the Dog River, and on the Central Vermont Railroad, about nine miles south by west of Montpelier. It is in a valley surrounded by low hills and mountains. Bald and Paine mountains are near. It contains the Carnegie and Brown libraries, a monument to Governor Paine and a soldiers' monument. In the vicinity

are black slate and granite quarries. The chief industries are connected with the quarrying of granite and slate, and with farm and dairy products. It has flour and lumber mills and hosiery and woolen factories. It is the seat of the Norwich University, established in 1819 and opened in 1834. The village owns and operates the electric-light plant. Pop. 1,916.

NORTHFIELD CONFERENCES AND SUMMER SCHOOLS, a series of meetings for Christian workers established at East Northfield, Mass., in 1882, by the evangelist, Dwight L. Moody (1837-99), a native of that town. The first meeting was a student conference in 1886. This conference has assembled once a year ever since that date. The object is to interest students from various colleges in activities of religious endeavor, particularly missions. The General Conference of Christian Workers has met here annually ever since 1888. Other annual gatherings include the Sunday School Workers Conference, the Young Women's Conference, the Home Mission School and the Foreign Missionary School. Associated with the work is the Mount Hermon School which gives courses in Bible study during the summer.

NORTHINGTON, nôr'thing-tôn, **Robert Henley**, 1st EARL OF, English statesman; b. about 1708; d. Grange, England, 14 Jan. 1772. He was educated at Oxford; in 1733 was called to the bar and in 1747-57 sat in Parliament for Bath. In 1756 he was appointed Attorney-General and in the next year became Lord Keeper of the Great Seal (the last to hold that office) and took his seat as speaker of the House of Lords, over which he presided for three years. In 1761 he was made Lord Chancellor and owing to ill-health resigned in 1767. First attached to the Leicester House party, he became one of the "King's friends."

NORTHMEN. See NORMANS.

NORTHROP, nôr'thrŭp, **Birdsey Grant**, American educator and clergyman; b. Kent, Conn., 18 July 1817; d. Clinton, Conn., 28 April 1898. He was graduated at Yale in 1841; and from its divinity school in 1845; and was subsequently a pastor of a Congregational church at Saxonsville, Mass., for 10 years. He was agent of the Massachusetts State Board of Education and secretary of the Board of Education of Connecticut 1857-67 and in the latter office was partly instrumental in the introduction of free and compulsory education. He introduced the observance of Arbor Day in schools and was considered as the "father of Village Improvement Societies." In 1872 he was invited by the Japanese government to establish a system of public education in Japan. Although he declined the honor, he rendered such valuable service to that country that he was received as the guest of the Japanese nation.

NORTHROP, **Cyrus**, American educator; b. Ridgefield, Conn., 30 Sept. 1834. He was graduated at Yale in 1857, from its law school in 1859 and was admitted to the bar in 1860. He was clerk of the Connecticut house of representatives in 1862 and of its senate in 1863. He became editor of the New Haven *Palladium* in 1863 and in 1863-84 was professor of rhetoric and English literature at Yale. From 1869-81 he was collector of the port of New Haven;

president University of Minnesota 1884-1911, thereafter president emeritus. Died 3 April 1922.

NORTHROP, Harry Pinckney, American Roman Catholic bishop: b. Charleston, S. C., 5 May 1842; d. 7 June 1916. He was graduated at Mount Saint Mary's College, Emmitsburg, Md., in 1860, studied four years in the theological seminary there and at the American College in Rome, and was ordained to the priesthood in 1865. He held several pastorates in his native city and elsewhere, and was consecrated in 1882 as vicar apostolic of North Carolina. In 1883 he was transferred by papal brief to the see of Charleston.

NORTHUMBERLAND, nôr-thûm'bér-land, **John Dudley**, DUKE OF, English statesman: b. England, 1502; d. London, 22 Aug. 1553. During the war with France 1544-45 he commanded the English squadron, accompanied Hertford in his invasion of Scotland and later was one of the executors of the will of Henry VIII. In 1547 he took a decisive part in the battle of Pinkie and suppressed Ket's rebellion in 1549. He schemed against Somerset, the Protector, and in 1550 was the dominant influence in the council and the chief instrument in his condemnation and execution. The next year he was created Duke of Northumberland, lord high steward and earl marshal. Then ambition overleaped itself. His fourth son, Lord Guilford Dudley, married Lady Jane Grey in May 1553 and the duke persuaded Edward VI to name her as his successor, thus setting aside the Princesses Mary and Elizabeth. Through Northumberland's influence she was placed on the throne 10 July, but the scheme miscarried and he was executed for high treason. He was the ablest general of his time, adopted the Reformation that he might pillage the religious houses and recanted on the scaffold.

NORTHUMBERLAND, Robert de Mowbray, EARL OF, English warrior: d. about 1125. He was a son of Roger de Montbri, a follower of William the Conqueror, and was made Earl of Northumberland some time not far from 1080. He was constantly engaged in feudal quarrels in the course of which he burned Bath and ravaged Wiltshire; and when Malcom, king of Scots, invaded England for a second time in 1093 he was met and slain by Mowbray at Alnwick. He raised an insurrection in 1095 and endeavored to wrest from the Conqueror's sons the crown and give it to their cousin, Count Stephen of Aumâle. At first successful, he was finally forced to retreat to his great castle of Bamborough, where, after a stout resistance, he was finally taken, and though reports conflict, it is reasonably certain that the remaining 30 or more years of his life were spent in prison. He founded the priory at Tyne-mouth.

NORTHUMBERLAND, Earls of. See PERCY.

NORTHUMBERLAND, 7TH DUKE OF, Henry George Percy: b. 1846; d. 14 May 1918. He was educated at Oxford University, served in the army (volunteers) and sat in the House of Commons for 17 years before he succeeded to the dukedom in 1899. Of great wealth and numerous titles, he filled a number of public offices—as a magistrate, a Fellow of the Royal Society and president of the Royal Institution;

a trustee of the British Museum and treasurer of Queen Victoria's household. As lord high steward he carried Saint Edward's crown at the coronation of King George in 1911. His sons won high distinctions in the army during the Egyptian, South African and European wars.

NORTHUMBERLAND, England, a maritime county bordering on Scotland and on the North Sea; fifth in size of English counties; area, 2,018 square miles. The county-seat is Newcastle-upon-Tyne, and other large towns are Wallsend and Tynemouth. The surface is diversified with hill, moorland and valley, gradually rising from the coast to the Cheviot range, and its principal river is the Tyne. Beans, wheat and barley are the principal crops; shorthorns and Cheviot sheep are largely raised. Coal and iron mining and their supplemental industries place Northumberland high among the most productive counties of England. It is celebrated for its archaeological remains, Hadrian's Wall crossing the county in the direction of Solway. Consult histories by Bates (1895); Hodgson (1820-40: a recognized authority); and that published in 10 volumes by Reid of Newcastle (1893-1914); Gibson, 'Renowned Castles, Churches and Antiquities' (1848-54); and Bruce, 'The Roman Wall' (1874).

NORTHUMBERLAND, Pa., town in Northumberland County, 54 miles north of Harrisburg, on the Susquehanna River and on the Pennsylvania, the Philadelphia and Reading and the Delaware, Lackawanna and Western railroads. The town is beautifully situated in picturesque mountain scenery and is a popular summer resort. Two large bridges span the river at this point. In the vicinity are mineral springs and large deposits of iron ore and limestone. The town manufactures nails, hats and caps, coffins and silk, and has flour mills, planing mills, iron works, forge works and extensive freight yards with machine shops and other buildings constructed by the Pennsylvania Railroad Company. Pop. 3,517.

NORTHUMBRIA, England, an ancient Anglo-Saxon kingdom, one of the Heptarchy, which extended from the Humber to the Forth and included Lancaster and Cumberland, and was bounded on the west by the kingdoms of Strathclyde and Cumbria. The kingdom was founded by Ida, an Anglican chief, who invaded the country in 547. On the death of Ida in 560 part of it was incorporated in the kingdom of Deira, which occupied also what is now Yorkshire. Bernicia and Deira were united under Ethelfrith in 593. It was Christianized under Edwin (617-33) and his successor, Saint Oswald (d. 642). In 792 it was ravaged by the Danes. While it became subordinate to Wessex in 827, under King Egbert, it was not until after the Norman Conquest that the kingdom really became an integral part of England.

NORTHWEST BOUNDARY. See BOUNDARIES OF THE UNITED STATES.

NORTHWEST BOUNDARY DISPUTE, the disagreement between the United States and Great Britain from 1814 to 1846, respecting the northwest frontier. The territory bounded north by lat. 54° 40', east by the Rocky Mountains, south by lat. 42°, and west by the Pacific Ocean, had been claimed

at various times and to various extents by Russia, Spain, Great Britain and the United States. The Russian claim, which rested mainly upon occupation by fur traders, was settled by a treaty 11 Jan. 1825. Under this treaty the United States were to make no settlements north of lat. $54^{\circ} 40'$, and Russia none south of that latitude. Great Britain and Russia agreed upon the same terms. The Spanish claims were confined south of lat. 42° by the treaty which ceded Florida in 1819. Great Britain had little or no claim by discovery. The United States claim rested upon the voyage of Gray up the Columbia River in 1792 and the explorations of Lewis and Clark through the Rocky Mountains and through the Oregon country in 1805-06, under the orders of Jefferson. By the treaty of 20 Oct. 1818 the whole territory west of the Rocky Mountains was to be opened to both countries for 10 years and, in 1827, the joint occupation for an indefinite period was agreed upon. Later this produced dissatisfaction and, after considerable negotiation, Great Britain was induced in 1846 to accept lat. 49° as the boundary from the Rocky Mountains to the channel between Vancouver Island and the mainland. See **BOUNDARIES OF THE UNITED STATES; ALASKAN BOUNDARY COMMISSION.**

NORTHWEST COMPANY, The. An organization, chiefly of Scottish-Canadian traders, formed in 1783 as a rival in the fur trade of the Hudson's Bay Company, which since 1670 had enjoyed by charter a monopoly of trade in Prince Rupert's Land. This company absorbed one of its rivals, the X-Y Company, in 1795; performed a great work in the exploration of the Pacific slope; decided in 1805 to extend its posts to the mouth of the Columbia, and built several forts south of lat. 49° but was forestalled at the mouth of the Columbia by the founding of Astoria in 1811 by the Pacific Fur Company, established by John Jacob Astor, which company it absorbed in 1813. It strongly opposed the Selkirk settlement on the Red River—an opposition which culminated in the Seven Oaks affray in 1816; and in 1821 it was incorporated by the Hudson's Bay Company.

NORTHWEST FRONTIER PROVINCE, India. A political and administrative province of British India, constituted in 1901, out of part of the province of the Punjab. It is bounded on the north by the Hindu Kush, on the south by Baluchistan, on the east by Kashmir and the Punjab and on the west by Afghanistan. It has an area of 38,665 square miles; but only 13,193 square miles are British territory, the remainder being inhabited by tribes under the political control of the agent to the governor-general of India. These mountain regions came under the suzerainty of the British government during the latest Afghan War; and it was the attempt, on the part of the conservative administration of Great Britain, to separate these tribes from the quasi-authority of the Amir of Kabul, and to bring them under the power of Great Britain, which led to the Afghan War of 1878.

Pathans from the greater part of the population and are the dominant class. About 92 per cent of the people are Mohammedans of the Sunni sect; 65 per cent are engaged in agriculture and 14 per cent in industry.

The capital of the province is the ancient city of Peshawar (q.v.), the residence of the chief commissioner. There are deputy commissioners at Peshawar, Abbotabad, Kohat and Dera Ismail Khan. Outside the native city of Peshawar there is a large military cantonment and there are outlying stations of English and native troops. There is railway communication from India to Peshawar, crossing the river Indus at Attok, and running to the entrance of the Khyber Pass. There is also a railroad to Kohat, and to Dera Ismail Khan.

The Peshawar Valley is watered by the Kabul River, which empties itself into the Indus at Attok; and the Derajat Valley is drained by the Kuram and the Gambila rivers. On the left bank of the Kabul River is the district of Yusufzai, inhabited by an Afghan people speaking the Afghan language. Nearly all the invading armies of northern India have passed through the Peshawar Valley. In this valley there are interesting and important Buddhist remains. The most notable of these are at Takh-i-Bhai, a short distance from Murdan, and the Gurdhatra in the centre of the city of Peshawar. The valley is said to have been frequently visited by Gautama, the founder of Buddhism. It is notoriously unhealthy and is designated by the British soldier "the valley of death." The temperature ranges from a minimum of 17° in February to a maximum of 137° in July. The rainfall varies from 17 to 25 inches. There are two rainy seasons, the monsoon and winter; two harvest seasons, spring and autumn, wheat being the chief product of the spring and millet of the autumn harvest. The principal agricultural products of the province are wheat, millet, jawar, cotton, rice and indigo. The Peshawar Valley is especially celebrated for its rice. The poppy plant is extensively grown in the Darajat. The cultivation of the land mainly depends upon artificial irrigation. Rock salt is the principal mineral product. Pop. of British territory 2,196,933.

NORTHWEST PASSAGE. See **ARCTIC REGIONS; POLAR RESEARCH.**

NORTHWEST PROVINCES, India, until 1901 the designation of a political division now the UNITED PROVINCES OF AGRA AND OUDH (q.v.).

NORTHWEST TERRITORIES, Canada, the general name first given to the great areas of British North America lying northwest of the watershed of the Saint Lawrence River. The boundaries have been gradually circumscribed by the creation of the provinces of Manitoba, Saskatchewan and Alberta and the Yukon territory and by successive extensions of the provincial boundaries. The most recent boundary extension act, that of 1912, enlarged the provinces of Manitoba, Ontario and Quebec by areas formerly included in the territories. Manitoba received an accession of 178,100 square miles, Ontario 146,000 square miles, and by the addition of Ungava and that part of Labrador which is included in the Dominion of Canada, Quebec acquired 354,961 square miles of additional territory. The Northwest Territories now comprise the old provisional districts of Mackenzie, Franklin and Keewatin, lying north of the provinces of Alberta, Saskatchewan and Manitoba, extending to the Arctic Ocean and including the islands

therein as far north as land has been discovered. The area is estimated at 1,242,224 square miles, of which 34,298 square miles are water; and the population of this vast area, which is decreasing, is about 10,500, of which 5,100 are Indians, 2,600 Eskimos and the remainder chiefly half-breeds. The territories form mainly an undulating plain or tableland, and all the shores overlook tidal waters. The principal lakes are the Great Bear and Great Slave lakes, respectively, 11,800 and 11,700 square miles in area. The Mackenzie River has a total length of 2,525 miles, and with its tributaries drains an area of 682,000 square miles; the second river, the Dubawnt, is 875 miles in length. The climate varies greatly according to location from temperate to arctic. In the western part the vegetation is similar to that of the Prairie provinces; but north and northeast the vegetation becomes stunted, and about half the total area of the territories is composed of great treeless plains known as the Barren Lands. In the Mackenzie Valley garden vegetables are successfully raised, and the soil is well adapted for oats and barley. Animal life varies as it passes from the Canadian through the Hudsonian to the Arctic Zone, and includes moose, beavers, bears, caribou, white wolf and seals. Fish, which are very abundant, form the staple food of the inhabitants, and include whitefish, the most valuable fish food of the north. Gold was first attempted to be worked by Sir Martin Frobisher in 1576, and it is known that veins exist; copper is abundant, and coal occurs in large quantity in the southwestern part of the territories. The seat of government is Ottawa, and it is under the jurisdiction of the commissioner of the Royal Northwest Mounted Police. Consult Tyrrell, J. B., 'The Northwest Territories' (in 'Canada and Its Provinces,' Vol. XXII, 1914).

NORTHWEST TERRITORY, United States, the name given by the Continental Congress of America, in 1787, to a region east of the Mississippi, north of the Ohio, south and west of the Great Lakes and west of Pennsylvania. The greater part of this territory belonged to France prior to 1763, when, by treaty, Great Britain became possessor of all the domain east of the Mississippi, in North America, which had been claimed by France. The territory west of the Alleghany Mountains and north of the Ohio River was, in 1774, annexed to the province of Quebec. By the treaty of peace with Great Britain, at the close of the Revolutionary War, in 1783, this region was ceded to the United States. Its area was about 265,878 square miles and it bordered on all the great interior waterways of North America which had been explored; the Saint Lawrence River, because a part of the Great Lakes, not excluded. The exact status of this territory was a subject of dispute for several years, on account of the conflicting claims of ownership of New York, Virginia, Connecticut and Massachusetts. The States mentioned cited in support of their claims various early grants from the Crown and conquests of Indian tribes. The original Colonial charter usually gave definite north, east and south boundaries but that of the west was often the sea, the South Sea, the ocean, etc., which was interpreted as Pacific Ocean. The other States of the Union refused to recog-

nize the claims based on charters and acts as cited, but held that the lands in question should belong to the whole Union and should be administered for the common good. Congress in session, in 1780, gave a pledge to the Union that if the States claiming this western territory should cede it to the Confederation it should be used for the good of all the States, and should, in due time and under proper conditions, be admitted as States of the Union, with equal rights and privileges with the original States. New York was the first to cede her claims, in 1781; three years later Virginia ceded her claims, except a section north of the Ohio River (now the southern part of the State of Ohio) called for some time the "Virginia Military District." In 1785 Massachusetts gave up her claims, and in 1786 Connecticut ceded all except a strip extending from the Pennsylvania boundary westward 120 miles, comprising about 6,000 square miles and called the "Western Reserve" (q.v.). Connecticut retained jurisdiction over this territory until 1800. A tract of 500,000 acres, in the western part of the "Western Reserve," was donated by Connecticut as "Fire Lands" to be divided as directed among such of its citizens as had been damaged by incursions of the British troops during the Revolutionary War. On 13 July 1787 the "Northwest Territory" was established by the Continental Congress. The ordinance was prepared by the chairman of the committee, Nathan Dane of Massachusetts. This ordinance provided for the enactment of certain rules deemed necessary for the public good, the chief provisions of which were (1) that not less than three nor more than five States should be formed out of the "Northwest Territory"; (2) that slavery should be prohibited forever within its borders; (3) that religious freedom should be wholly and entirely established and maintained; (4) that schools and means of education should be forever encouraged; (5) that the writ of habeas corpus and trial by jury should be guaranteed to all its inhabitants. A form of government was provided for and the territory was divided. It was further provided that when any one of the divisions had a population of 60,000 it might be admitted into the Union as a State. Certain conditions of admission were exacted in accordance with the Ordinance of 1787. The Continental Congress which established the "Northwest Territory" and so wisely provided for its admission into the Union had its last roll-call 10 Oct. 1788.

The new Congress confirmed the ordinance relating to this Territory. At first the government was administered by means of a governor, secretary and three judges appointed by Congress, who governed the whole as one district. The governor and judges sitting together had power to make and execute such laws as they deemed needful for the district, subject to the approval of Congress, until such time as the Territory would have a legislature of its own. Provision was made for a legislature when there were in the Territory 5,000 free male inhabitants of full age to be voters. This legislature was to consist of a legislative council of five members, chosen by Congress, and a house of representatives chosen by male inhabitants who were freeholders. The first governor of the Northwest Territory, Arthur St. Clair, was

appointed October 1787. He arrived at Marietta, the capital, July 1788. His first official act was the founding of Washington County. He appointed magistrates, established courts, arranged for defense against the Indians and in every way sought to promote the advancement of the country. The first legislature of the Territory met 24 Sept. 1799. The house of representatives had 22 members, representatives of the nine counties of the whole Territory. In May 1800, upon petition, Congress divided the Northwest Territory into two territorial governments, the boundary between which was a line extending from the mouth of the Kentucky River north to Canada. The portion east of this line was called "Territory Northwest of the River Ohio," and its capital was Chillicothe. The portion west of this line was called "Indiana Territory," and the capital was Vincennes. William Henry Harrison was first governor of the "Indiana Territory." Virginia completed her articles of cession 1 March 1784. On that same day Jefferson, as chairman of a committee, proposed a plan which was adopted by Congress 23 April 1784. The territory was to be divided into States, each State two degrees wide and the lines to be intersected by two meridians, one passing through the falls of the Ohio and the other through the mouth of Kanawha River. The States were to be named Chersonesus, Assenisipia, Sylvania, Pelisipia, Illinoia, Polyptoamia, Washington, Mesopotamia and Michigania. Slavery or involuntary servitude were to be allowed only as a punishment for crime. The plan never went into effect and was superseded by the Ordinance of 1787, whereby the Northwest Territory was established as mentioned. In 1785, the year Massachusetts yielded her claims, Congress provided for a survey of the lands in dispute. Ohio, the first State formed out of the Northwest Territory, was admitted in 1803 and was the 17th State of the Union. Michigan Territory was created January 1805 and William Hull was first governor. It was admitted as a State in 1837. Illinois Territory was organized in 1809; Kaskaskia was the capital. It was admitted as a State on 3 Dec. 1818. Indiana was admitted as a State in 1816. A part of Michigan Territory was in 1836 organized as the Territory of Wisconsin. It became a State in 1837. A part of the Territory of Wisconsin is now the eastern part of Minnesota.

Consult Hinsdale, B. A., 'The Old Northwest' (2d ed., New York 1889); McCarthy, D. G., 'Territorial Governors of the Old Northwest' (Iowa City 1910); Merriam, J. M., on the 'Legislative History of the Northwest Ordinance' (in 'Proceedings' of American Antiquarian Society, April 1888); Moore, C., 'The Northwest under Three Flags' (New York 1900).

NORTHWESTERN COLLEGE, a co-educational institution in Naperville, Ill., founded by the Evangelical Association in 1861. Its faculty comprises 42 professors and instructors and there are nearly 600 students. The library contained about 15,000 volumes; the grounds, buildings and other property in 1922 were valued at \$626,789.73 and its income for the year was given as \$167,782.45. The number of graduates is more than 700.

NORTHWESTERN UNIVERSITY, Ill., chartered under the auspices of the Methodist Episcopal Church, in 1851, and first opened in 1855. The first department organized was the collegiate department; the present organization includes (1) the College of Liberal Arts; (2) the Medical School; (3) the Law School; (4) the School of Pharmacy; (5) the Dental School; and (6) the School of Music; the college and the School of Music are at Evanston, Ill., and the professional schools in the city of Chicago. The university also maintains three secondary schools, namely, the academy at Evanston, Grand Prairie Seminary at Onarga, Ill., and Elgin Academy at Elgin, Ill. The Garrett Biblical Institute, a theological school under separate management, is located on the college campus, and is in close co-operation with the university; the Norwegian-Danish Theological School and the Swedish Theological Seminary are affiliated with the institute. The work of the College of Liberal Arts is mainly elective, the courses being arranged for major work in one department and minor work in another; the degrees of A.B. and B.S. are conferred; the corresponding master's degrees and the degree of doctor of philosophy are conferred for graduate work. The government is by a board of 36 trustees elected by the board, to which are added eight chosen by Church conferences. Women are admitted, and dormitories on the campus are provided for their use. The campus contains about 75 acres of ground, on the shores of Lake Michigan; the buildings include the old college, the first building erected, University Hall, the Fayerweather Hall of Science, the gymnasium, the observatory and the library. The professional schools occupy their own buildings in Chicago, the law school, school of pharmacy, and dental school being in Northwestern University Building at the corner of Lake and Dearborn streets, and the medical school having two buildings on Dearborn street, between 24th and 25th streets. There is a large athletic field, and the athletic affairs of the university are under the management of a committee of 15, 5 from the faculty, 5 from the alumni and 5 from the students. The Students' Debating Society is affiliated with the Central Debating League, including the students' societies of the universities of Michigan, Chicago and Minnesota; and with the Northern Oratorical League, including societies from the universities of Michigan, Wisconsin, Iowa, Chicago, Minnesota and Oberlin College. The college library contains over 140,000 volumes, besides 35,000 pamphlets, and the professional schools have also special libraries. In 1922 the productive funds amounted to \$5,200,000, and all property was valued at \$13,060,000. Its income was \$2,000,000; number of students in attendance, 8,500; number of professors and instructors, about 575.

NORTHWICH, England, town in Chester, at the confluence of the Weaver and Dane, 16 miles northeast of Chester and 172 miles northwest of London, on the London and Northwestern Railway. It is noted for its salt mines and brine springs which have been worked from prehistoric times. Northwich is still the centre of the principal production of salt in Great Britain. Both rock salt and white salt obtained by evaporation from brine are exported. The white salt produced here is sent chiefly to

America. The annual product amounts to about 1,500,000 tons. The Marston Mine, 300 feet deep, is very picturesque with its vault supported by enormous salt pillars. Owing to the pumping of brine for the manufacture of salt and alkali, the town has caved in at many places. Some of the houses have sunk or stand at fantastic angles. In 1892 a portion of High street which had sunk had to be raised six feet. Boats are built here to convey salt to Liverpool down the river Weaver which is connected by a hydraulic lift a mile from the town with the Trent and Mersey Canal at a higher level. The chemical works at Northwich are among the largest in the world. Other industries include manufactures of bricks, iron, brass, leather, fur, tanneries and iron foundries. The principal buildings are the church of Saint Helen, Witton, with a finely curved roof of the 17th century and a market-house. A museum and a library were presented to the town by Sir John Brunner in 1887. In the same year Robert Verdin gave Verdin Park to Northwich. Pop. 18,151.

NORTON, nôr'tôn, **Andrews**, American Unitarian theologian: b. Hingham, Mass., 31 Dec. 1786; d. Newport, R. I., 18 Sept. 1852. He was graduated at Harvard in 1804, and after studying theology was a tutor in Bowdoin College in 1809. He returned to Harvard in 1811 as mathematical tutor there; and became in 1813 librarian of the university and lecturer on Biblical criticism and interpretation. In 1819-30 he was Dexter professor of sacred literature. He was among the most eminent exponents of Unitarianism, equally strong in his protests against Calvinism and the naturalistic theology represented by Theodore Parker. He published 'Reasons for not Believing the Doctrines of Trinitarians' (1833; new ed., with memoir by W. Newell, 1856; 11th ed., 1876); 'The Genuineness of the Gospels' (1837-44); 'The Latest Form of Infidelity' (1839). In 1833 with Charles Folsom he inaugurated the *Select Journal of Foreign Periodical Literature* (4 vols., 1833-34). For his verse consult Griswold, 'Poets and Poetry of America' (Philadelphia 1842).

NORTON, **Caroline Elizabeth Sarah Sheridan**, English poet and novelist: b. London, 1808; d. there, 15 March 1877. A granddaughter of Richard Brinsley Sheridan and a sister of Lady Dufferin, she showed her talent at 13 with 'The Dandies' Rout.' She was married to George Chapple Norton in 1827; procured for him a police magistracy by her influence with the Home Office; broke with her husband in 1836, when he accused Lord Melbourne (q.v.) of criminal intercourse with her; and was vindicated entirely of this charge in a famous suit, the basis of Dickens' *Bardell v. Pickwick*, in the 'Pickwick Papers.' Her differences with her husband were not then ended, for he claimed not only the custody of her children but the income from her writings. She wrote 'English Laws for Women in the Nineteenth Century,' a pamphlet which contributed to the change of English laws as to the status of women. Two weeks before her death Mrs. Norton was married to Sir William Stirling-Maxwell. A supposed episode in which she, Melbourne and Barnes of the *Times*

figured was made the basis of Meredith's 'Diana of the Crossways'; but the novelist in his latest editions warns his readers that the story "is to be read as fiction." Her principal works are 'The Sorrows of Rosalie' (1829), a Byronic poem; 'The Dream' (1840); 'The Lady of La Garaye' (1862), her best poem, which has much the tone of Campbell; 'A Voice from the Factories' (1836), and 'The Child of the Islands' (1845), both attacking social conditions; and the novels, partly autobiographical, 'Stuart of Dunleath' (1851), 'Lost and Saved' (1863), and 'Old Sir Douglas' (1867). Consult the 'Life,' by Jane G. Perkins (1909).

NORTON, **Charles Eliot**, American scholar: b. Cambridge, Mass., 16 Nov. 1827; d. there, 21 Oct. 1908. He was a son of Andrews Norton (q.v.) and after he was graduated from Harvard in 1840 was in the employ of a Boston establishment in the India trade. Except a voyage to India in 1849 and various trips to Europe his life was passed in the house where he was born. During the Civil War period he edited the papers of the Loyal Publication Society and with his friend, J. R. Lowell, edited the *North American Review* 1864-68. From 1875 to 1898 he was professor of the history of art at Harvard, becoming professor emeritus in the year last named. As a Harvard professor he exercised a salutary influence over successive generations of colleagues before whom he has placed the highest ideas. The young men were helped by him to quicker perception of what culture really is as well as to discriminative discernment between true and false culture—between thoughtful, intelligent citizenship, and the noisy, puppyish assertion that so often passes itself off as patriotism. Few Americans have been sterner critics than he of whatever in American life falls below an ideal standard, and as a consequence few men, not professedly politicians, have been the target for so much adverse comment as was Professor Norton. Stigmatized often as unpatriotic he rose to a much higher level of patriotism than his critics. He enjoyed the friendship of many of the foremost personages of his time and was the literary executor of such men as Lowell, Carlyle, Emerson, Curtis and Ruskin. He was the foremost of American Dante scholars and was the founder of the American Dante Society, as well as of the Archæological Institute of America, of which he was the president for many years. His published books include 'Considerations on Some Recent Social Theories' (1853); 'The New Life of Dante' (1859, a partial translation with essays, followed by a complete translation); 'Notes of Travel and Study in Italy' (1860); 'Historical Study of Church Building in the Middle Ages' (1880); 'The Divine Comedy of Dante' (1891-92), a much-prized prose translation; 'Poetry of Gray as a Naturalist' (1903); 'Longfellow' (1907); 'A History of Ancient Art,' lectures of Norton's edited by Brown and Wiggin (1891). He also edited 'The Early Letters of Thomas Carlyle' (1886); 'Letters of James Russell Lowell' (1894); 'Letters of Ruskin to C. E. Norton' (1904). Consult Emerson and Harris, 'C. E. Norton' (Boston 1912) and Norton, Sara, and De Wolfe Howe, M. A., 'Letters of Charles Eliot Norton, with Biographical Comment' (2 vols., Boston 1913).

NORTON, Frank Henry, American journalist: b. Hingham, Mass., 20 March 1836; d. Brooklyn, 19 Feb. 1921. He was connected with the Astor Library in New York (1855-65) as assistant librarian and assistant superintendent. Entering journalism in 1872, he was editor and owner of the New York *Era* 1879-81, and from 1883-91 was on the staff of the New York *Herald*. Besides such dramatic burlesques, etc., as 'Alhambra,' 'Cupid and Psyche,' he wrote 'Life of Alexander H. Stephens' (1883); 'The Malachite Cross' (1894); 'Historical Register of the Centennial Exposition' (1876), and 'Historical Register of the Paris Exposition' (1878); 'Daniel Boone' (1883). He was one of the founders and for several years served as president of the American Numismatic and Archaeological Society, etc.

NORTON, John, American colonial clergyman: b. Shortford, Hertfordshire, England, 6 May 1606; d. Boston, Mass., 5 April 1663. He was educated at Cambridge University, entered the ministry and in 1635 left England and came to Boston. He was pastor at Ipswich in 1636-52; then he succeeded John Cotton as colleague of John Wilson in the pastorate of the First Church of Boston. In this charge his influence steadily increased and his opinions came to be sought by officials of both church and state. He was still in this position when the colonies decided to send their petition to Charles II in 1662, and was selected to accompany General Bradstreet; though the petition was nominally granted and Norton had without doubt performed his delicate task with fidelity, the colonies were dissatisfied with the results and henceforward his popularity waned. This change in public feeling was without doubt the cause of his death in the following year. He wrote 'Responsio ad Totam Questionum Syllogen'; 'The Orthodox Evangelist' (1654); 'The Heart of New England Rent by the Blasphemies of the Present Generation' (1660), etc.

NORTON, Lillian. See NORDICA, LILLIAN.

NORTON, Richard, American archaeologist and educator: b. Dresden, Germany, 9 Feb. 1872. He is the son of Charles Eliot Norton and was graduated from Harvard in 1892, after which he studied in Germany and at the American School of Classical Studies in Athens, Greece. From 1899 to 1907 he was director of the American School of Classical Studies in Rome. In 1903 he visited central Asia in pursuit of archaeological study, and in 1910-11 he was director of the excavations made at Cyrene under the auspices of the Archaeological Institute of America and the Boston Museum of Fine Arts. In 1914 he organized and became commander of the American Volunteer Ambulance Corps and served with the French army. He is the author of 'Bernini and Other Studies in the History of Art' (New York 1914).

NORTON, Sidney Augustus, American chemist: b. Bloomfield, Ohio, 11 Jan. 1835; d. 30 Aug. 1918. He was graduated from Union College, Schenectady, N. Y., in 1856 and from Miami Medical College in Cincinnati 1867, in which latter institution he was professor of chemistry 1867-72. In 1873 he became professor of chemistry and from 1899 was professor emeritus at the Ohio State University. He published 'Elements of Natural Philosophy'

(1870); 'Essays and Notes' (1874); 'Elements of Physics' (1875); 'Elements of Inorganic Chemistry' (1878); 'Organic Chemistry' (1884), etc.

NORTON, Thomas, English dramatist and lawyer: b. Bedfordshire, England, 1532; d. England, 1584. He became private secretary to Somerset, was afterward counsel for the Stationers' Company and the Merchant Tailors' Company. He was elected to Parliament in 1558 where his eloquence soon gave him a commanding position in debate. He was a persecutor of the Catholics. His views on the episcopacy brought him into trouble and he was imprisoned in the Tower for treason. He collaborated with Sackville in writing 'The Tragedie of Gorboduc' (1560-61) which was the first English blank-verse tragedy.

NORTON, Thomas Herbert, American chemist and consular officer: b. Rushford, N. Y., 30 June 1851. He was graduated from Hamilton College, Clinton, N. Y., in 1873 and afterward studied at Heidelberg. From 1878 to 1883 he was manager of important chemical works in Paris, France, and was professor of chemistry in the University of Cincinnati 1883-1900. In May 1900 he was appointed to establish the United States consulate at Kharput, Turkey, was made consul at Smyrna in 1905 and at Chemnitz, Saxony, in the following year, remaining until 1914. He compiled for the Department of Commerce important reports on the chemical industries of Europe. Since 1915 he has been detailed as special agent to investigate the chemical industries, especially dyestuffs, for the Department of Commerce. He has published 'Dyestuffs for American Textile and Other Industries' (1915); 'Dyestuff Situation in the United States' (1915); 'Potash from Kelp' (1915).

NORTON, Mass., town in Bristol County, 30 miles south of Boston and eight miles northwest of Taunton, on the New York, New Haven and Hartford Railroad. The Wheaton Female Seminary is situated here, and a public library is maintained. The town manufactures paper and wooden boxes and jewelry and has bleaching-works and a wool-combing plant. Pop. 2,544.

NORTON SOUND, an arm of Bering Sea indenting the west shore of Alaska. It is about 200 miles long and 175 miles wide from Cape Nome to Cape Dyer. The Yukon is the largest river flowing into the sound; a number of short streams enter from the north. The coast is irregular; the largest indentations are Golofnin and Norton bays and Golofnin Sound. A number of islands are along the coast; the largest are in the eastern part of the sound. Nome (q.v.) is the most important city on the coast. Captain Cook discovered Norton Sound in 1778.

NORUMBEGA, nō-rūm-bē'gā, a name given by the early explorers to various parts of the eastern coast of North America, also to a river and to a mythical Indian city. In 1539 the name was applied to the whole coast from Cape Breton to Florida, but this seems to have been on the authority of an anonymous narrative called 'Dieppe Captain.' The map of Verrazano's voyage, published in 1529, locates Aranbega on the coast of New England; Mercator's map, published in 1541, locates Anorum-

bega near the Hudson River; Gastaldi's map, 1556, locates Norumbega near Cape Breton. Other accounts mention Norumbega as a large river, brackish near the mouth; and still others picture it as a city with high towers and substantial houses. The rivers mentioned are supposed to have been Penobscot, Connecticut or Hudson. Champlain, in 1605, applied the name to Maine, and also to the Penobscot River. Humphrey Gilbert (q.v.) in 1583 began an exploration of the beautiful country of Norumbega, and so convinced was he of its existence that he took with him a poet to sing its praises. A map of 1582 makes Penobscot River a strait connecting the Saint Lawrence with the ocean at the mouth of the Penobscot. The country between was called Norumbega. The origin of the word has been attributed to many languages; as an Indian word meaning "still waters"; a Spanish word meaning "fields"; a Norse word, *Norvegr*, meaning Norway, etc. In 1889 Professor Horsford caused the erection of a memorial tower at the confluence of the Charles River and Stony Brook, near Watertown, Mass., in memory of Norumbega, a Norse city which once existed here. Considerable research has been given to the matter, and some historians claim to have reasonable proof of the origin and location of what by many is considered a mythical city or a name applied by different explorers to different rivers and locations on the coast between Cape Breton and Florida. Consult Fiske, John, 'Dutch and Quaker Colonies in America' (Boston 1899); Horsford, E. B., 'Defenses of Norumbega' (ib. 1891); and 'Discovery of Ancient City of Norumbega'; Beauvois, 'La Norambègue' (Brussels 1880); Winsor, Justin, 'Narrative and Critical History of America' (Boston 1884); De Roo, P., 'History of America before Columbus' (2 vols., New York 1900).

NORVAL, nôr'val, Young, son of Lady Randolph and her first husband, Sir Malcolm Douglas, in Homes' tragedy, 'Douglas' (1757). He is reared in obscurity and his identity is revealed to Lady Randolph only after he has saved the life of his stepfather. Glenalvon, the latter's heir, jealous of Norval, incites Lord Randolph's jealousy against him and a duel ensues in which Glenalvon is killed and Norval dies immediately after, whereupon Lady Randolph flings herself from a precipice. The part was much favored by both Kemble and Macready.

NORWALK, Conn., city, Fairfield County, on Long Island Sound, and on the New York, New Haven and Hartford Railroad, about 40 miles northeast of New York; area, 25 square miles. Norwalk was consolidated by a majority vote of the people in 1913, under one city, which includes South Norwalk, East Norwalk, West Norwalk, Rowayton, Broad River, Silvermine and Winnipauk. It has nine banks, four national banks, two trust companies, each with a savings department, and three savings banks; the annual weekly payroll to industrial workers alone is \$105,000 (1915). The chief industrial establishments are hat factories, corset, paper, shoe, silk, shirt, underwear, automobile, rubber factories, ladies' waists, air compressors, builders' hardware, etc. Oyster culture is extensively carried on, the Norwalk oyster being famous the world over. It is a fine residential

city, excellent schools. Norwalk was settled in 1649 and received a town charter in 1651. During the Revolutionary War, on 11 Nov. 1779, it was burned by British and Hessians. Pop. 27,743. Consult Selleck, C. M., 'Norwalk' (Norwalk 1896).

NORWALK, Ohio, city, county-seat of Huron County, on the Wheeling and Lake Erie (main line, and also Huron branch), New York Central Railway and Cleveland and South Western Electric railroads and the Lake Shore Electric, about 56 miles west by south of Cleveland and 14 miles south of Lake Erie. Huron County is one of the 10 counties which composed the "Western Reserve" or the "Connecticut Reserve." Historically the "Fireland" as the lands, having been purchased from the Indians and evidenced by deed were divided into parcels and given to Connecticut people whose property had been destroyed by the British. The townships in Huron County named after the Connecticut towns destroyed are Fairfield, Norwalk, Ridgefield, Norwich, Lyme, Greenwich, New London, New Haven. (See WESTERN RESERVE). The city is connected with a number of villages and cities by electric railroad. It was settled in 1816 by Platt Benedict, Elisha Whittlesey and others; incorporated in 1828 and chartered in 1840. It is in a productive agricultural region, and has extensive manufacturing interests. The steel and iron works have 200 employees; piano factory, 150 employees; printing works, 100; pyrography works, 150; canneries, 50. There are a number of smaller industrial establishments each having from 5 to 50 employees. Norwalk has a large trade in its own manufactures and in farm and dairy products, fruit and livestock. It has a fine courthouse, several wellbuilt business blocks and a number of handsome residences. Has 16 miles of paved streets and a sewerage system of about 25 miles. The educational institutions are one central and four ward public schools, two parish schools (R.C.), and a Carnegie library. There are 10 churches. The four banks have a combined capital of \$250,000, with deposits amounting to more than \$3,000,000. The government is vested in a mayor, who holds office two years, and a council of seven members chosen by popular vote. Norwalk has a very complete municipally-owned waterworks system and a newly installed municipal electrical lighting and power-plant. The Firelands Historical Society has one of the most valuable museums in the State. About three-fourths of the population are native born and the others are Germans and Irish. Pop. 7,858.

NORWAY (Norwegian NORGE; Swedish NORRIDGE or NORRIKE, signifying North Kingdom), the western kingdom of the Scandinavian Peninsula in the north of Europe. Norway is bounded on the northeast by Russian Lapland, east by Sweden, and on all other sides by the sea, the Arctic Ocean being on the north, the Atlantic and the North Sea on the northwest and west and the Skager-Rack on the south. From the Naze on the south, to a point adjoining the North Cape, the length southwest to northeast is about 1,080 miles; greatest breadth, measured nearly in the parallel of 60°, about 275 miles; area, 124,130 square miles. For administrative purposes Norway is divided into

six provinces corresponding with the stifts, or dioceses, and subdivided into 20 bailiwicks (*amter*). The stifts are Christiania, Hamar, Christiansand, Bergen, Trondhjem and Tromsø. Christiania is the capital.

Topography.—The coast consists for the most part of bold precipitous cliffs, and is remarkable for the vast number of islands by which it is lined, and the bays or fjords which narrow, deep and winding, cut into it in all directions, providing an almost uninterrupted series of excellent natural harbors of refuge. Many of these fjords are deeper than the sea outside which averages 200 fathoms; Sogne Fjord, for instance, is 2,820 feet deeper; Hardanger Fjord 930 feet; and Vest and Nord fjords 840 feet. Some of these fjords penetrate great distances inland and send off numerous branching arms. The Sogne Fjord cuts its way to the foot of the Jotun Fjeld, 106 miles from the ocean, and Hardanger Fjord encircling the Folgefond is 68 miles long; the Justedal lies between the Nord and Sogne fjords. These three are the most characteristic of the fjords and offer some of the most sublime and accessible scenery in Norway. The surface generally is mountainous, particularly in the west and north, the mountain masses, however, assuming the form of great plateaus or tablelands called fjelds, fields or fells, as the Hardanger Fjeld, Dovre Fjeld, etc. The main range, the Kjölen or Kell Mountains from 3,000 to 6,000 feet high, runs parallel to the coast from the plateau of Finmark in the north to 63° in the south and then divides, as the backbone of the peninsula forming the boundary with Sweden. The highest summits belong to the Sogne Fjeld, a congeries of elevated masses, glaciers and snow fields in the centre of the south division of the kingdom, where rise Galdhøppingen 8,400 feet, the Glitretind 8,384 feet and Skagastölstind 7,879 feet. The line of perpetual snow ranges from 5,000 feet in the south to 3,000 feet in the north. In general the valleys are short and abrupt; and the streams, dashing down impetuously through rocky gorges, form numerous cascades. The leveler portions of plateau regions consist of dreary moors, covered in winter with snow and in summer with coarse grass and heather, studded with numerous tarns and forest belts of conifers, birches, willows, etc. The grass affords pasturage to the sheep and cattle of the dalesmen. The *sætre* or huts of the herd-girls and the wood-cutters are the only habitations in the mountain solitudes.

Hydrography.—The short distance from the western slope to the western coast gives rise to a great number of minor streams, which proceed directly to the shore or the fjords. On the eastern slope the streams do not properly assume the character of rivers till they have run a considerable part of their course in Sweden. The few important rivers of Norway have a southerly direction in accordance with the general slope already referred to, and discharge themselves into the Skager-Rack; of these the longest are the Glommen 350 miles, Drammen 163 miles, with its tributary the Hallingdal 113 miles, Nummedal Laagen 143 miles, and Otteren 140 miles. Some of these streams in their lower courses expand into long narrow lakes of considerable size: Lake Mjøsen is 60 miles long, and its bottom is 1,080 feet below

the level of the sea; others are Randsfjord (43 miles long), Tyrifjord (19 miles), and Fæmünd (35 miles long and 2,300 feet above sea-level). The most important rivers in the north are the Tana, which forms part of the boundary between Russia and Norway, and falls into the Arctic Ocean; and the Namsen, which falls into the Atlantic.

Geology and Mineral Resources.—The prevailing rocks of Norway are gneiss and mica-slate, of which all the loftier mountains are composed. Granite is of comparatively rare occurrence. On some of the plateaus blocks of conglomerate occupy a large part of the surface. Porphyry, argillaceous schist and limestone occur, but in very limited quantities, and rocks of volcanic formation are rare. Almost all parts of the country bear traces of the grinding action to which the structural rocks were subjected during the Glacial period. The minerals are numerous and abundant; the most important are iron, copper, silver and cobalt; others are nickel, feldspar and marble. For a century down to about 1870 the copper and iron mines of Röros and the silver mines of Kongsberg yielded considerable outputs; but have since declined. The principal mine is at Vignæs on Karmö, at the entrance to Bukken Fjord, which yields \$300,000 worth of pyrites in the year. The total mineral output of Norway, iron pyrites, silver, copper, apatite, nickel, was valued at \$10,736,180 in 1915, showing an increase over preceding years. The silver mined was valued at \$270,000; copper at \$2,039,440; iron pyrites at \$4,672,200. Over 8,700 work people are employed in this occupation.

Climate.—Known as "The Land of the Midnight Sun," one-third of Norway lies within the frozen zone and the greater part between the same degrees of latitude as Greenland. It would in all probability be still covered with a similar ice-cap to Greenland, as it was in the end of the Tertiary period, were its shores, west and north, not washed by the Gulf Stream. It is mainly owing to this warm oceanic artery that Norway is habitable; its influence, together with the direction of the parallel mountain rampart, the distribution of the atmospheric pressure and the presence of deep-sea banks off the coast, determines the predominant climatological features of the country. The isotherms do not run from west to east, but parallel to the coast. The harbors on the west are never blocked with ice; while in places more inland, though much farther south, as at Christiania, this regularly happens. Hammerfest, for instance, on the north coast, in lat. 70° 40' N., has a winter mean of 22-6° F., 3° higher than Christiania, which has virtually an inland site, in lat. 59° 55' N. In winter the west coast districts are the warmest, and the cold increases in intensity according to the distance inland; whereas in summer the reverse is the case, though altitude is then a more potent influencing factor than in winter. The places that have the lowest winter mean (11.8°) are all inland, as Elverum and Röros (Röraas), near the Swedish frontier, Kautokeino (in southern Finmark), and Nyborg (at the head of Varanger Fjord); at all these places the mercury has been known to freeze (—40° F.). The places which have the highest summer temperature are Christiania, the southwest extremity of the country, the heads of the western fjords and

the interior of Finmark. The prevalent southwest winds bring considerable rainfall, 40 to 70 inches in the year, to the west coast of southern Norway. In the interior only 12 to 16 inches fall during the year.

Flora and Fauna.—In general the mountain slopes up to a certain height are clothed with magnificent pine forests, and at lower elevations the oak and the beech are by no means uncommon. In the loftier altitudes, below the snow line, willows, lichens and numerous wild berries—cranberries, raspberries, bilberries and cloudbberries—are found in summer. Among wild animals are the bear, wolf, lynx, fox, wild reindeer and lemming; buzzards, kestrels and owls prey on the smaller animals and birds; snipe, loom and teal abound in the lakes; lapwings and plovers breed in the tarns; in winter the ptarmigan is plentiful, and the eagle, sparrowhawk, woodcock, raven and crow are common throughout the kingdom.

Forestry.—The forests cover about 26,300 square miles, of which 73 per cent are pine trees; 4,000 square miles are under state control. The area of late years has greatly diminished, but trees are being systematically planted in several parts, especially in the southern and eastern parts of the country. The trees are cut down principally in winter and floated down the streams in early spring to the saw mills at their mouths. The saw mills, wood pulp and cellulose factories, give employment to about 12,000 people. The export of manufactured lumber in 1915 amounted to over \$14,328,990, and of wood pulp over \$16,457,064.

Fisheries.—The fisheries are of great value, and contribute mainly to the support of the inhabitants along the seaboard, from the Naze to the entrance of the White Sea. The fisheries are divided into three chief divisions—Lofoden, Romsdal and Finmark. They include cod, herring, mackerel, salmon, shark, walrus, seal and lobster fisheries, the cod and herring fisheries being by far the most important. Over 100,000 persons are employed in the fisheries, and the annual total value of the products of the fisheries in 1916 exceeded \$46,800,000, more than two-thirds of which was cod. The rivers and lakes abound with salmon and salmon-trout, and make Norway one of the best angling countries in the world.

Land Tenure, Agriculture, etc.—The farms are generally the property of those who cultivate them, small proprietors being common in Norway. They often include a large stretch of mountain-pasture, perhaps 40 or 50 miles from the homestead, to which the cattle are sent for several months in summer. Among the crops cultivated for food the principal is barley, which ripens at 70° of latitude; rye is successfully cultivated up to 69°; oats to 68°; but wheat not beyond 64°, and that only in the most favorable seasons. Another most valuable crop is potatoes, grown with success even in Finmark. Some hemp and flax are also produced, and in the southern part of the country some tobacco is grown. Fruit, too, particularly the apple, pear and cherry, is raised generally in all the lower localities of the south and the centre. The grain raised falls far short of the consumption. One of the most extensive and profitable branches of rural economy is the rearing of cattle, for which many parts of the country are well adapted. The breeds, however,

are inferior, but the milk of the cows is good and enters largely into the food of the inhabitants; and butter is produced in such quantities that there is a considerable export trade of that commodity. Sheep are less numerous than goats, and yield a coarse though abundant and warm wool; swine are not viewed with much favor. The horses are vigorous and sure-footed, but of diminutive size; the ponies are among the best of their kind, and are often exported. Another domestic animal of great value is the reindeer, which forms the principal stock of the northern provinces.

Commerce.—The export trade is chiefly confined to raw produce. The principal items are timber, with wood-pulp and cellulose; fish, smoked and dry, with ice, fish-oil, etc.; also copper ore, iron pyrites, lucifer matches, paper, etc. The chief imports are grain, bacon and other provisions, coals, textiles, wool, cotton, hemp, salt, sugar, coffee, tobacco, wine, brandy, etc. This trade is chiefly concentrated in the towns of Bergen, Christiania and Trondhjem, though Drammen, Stavanger, Christiansand and Arendal likewise have a considerable share in the commerce of the country. During the latter half of the 19th century the foreign commerce of Norway more than quadrupled; in 1916 the exports amounted to over \$256,966,580 and the imports to over \$351,952,874.

Manufactures.—These have increased since the protective system adopted by the non-renewal of the customs treaty with Sweden in 1897. The purely industrial establishments are grouped mainly around Christiania. They number 6,958 and employ 152,725 work people. Besides those already mentioned, the more important are textile manufactures, machine shops, chemical factories, iron and metal works, brick-works, flour mills, tobacco factories, breweries and in a minor degree tanneries, distilleries and factories for matches, glass, oil (fish and vegetable) and paper.

Shipping and Navigation.—Norway's mercantile navy amounted in 1918 to 3,424 vessels (of which 2,761 were steamships), with an aggregate tonnage of 1,508,758. The Norwegians are among the busiest sea-carriers of the world. Shipbuilding and supplemental industries are carried on chiefly at Christiania in about 150 establishments employing over 3,000 men. The Norwegian ports were entered in 1916 by 9,430 vessels of 4,700,000 tons and cleared by 9,387 vessels of 4,734,208 tons.

Railways, Communications, etc.—In 1918 there were 2,007 miles of railroad, of which 1,719 miles were controlled by the state and the rest operated by private companies; there were also 14,688 miles of telegraph and telephone lines, most of which also belong to the state, with 66,253 miles of wire. The national and communal roads had an aggregate length of over 15,000 miles; the principal means of communication, however, are steamboats.

Weights, Measures and Money.—The metric system (q.v.) of weights and measures was introduced in 1879 and became obligatory 1 July 1882. The unit of value is the krone, equal to 100 öre, comparative value 27 cents; the 20 kroner gold piece weighing 8.96 grams contains 8.0645 grams of fine gold, and the silver krone weighing 7.5 grams contains 6 grams of fine silver.

Banking.—There are two state banks, the Bank of Norway—"Norges Bank" and the "Kongeriget Norges Hypothekbank" or Mortgage Bank of the Kingdom of Norway. The Bank of Norway, although a joint-stock bank, is largely owned by the state, is governed by state laws and administered by directors elected by the Parliament, excepting the president, who is appointed by the king. It is the only bank authorized to issue bank notes, and besides state business is a general deposit, discount, circulation and loan institution. Its assets in 1916 amounted to nearly \$75,465,749; its balance to about \$13,379,049. The Kongeriget Norges Hypothekbank, established by the state in 1852 to issue loans on mortgage, had in 1916 capital of over \$7,280,000. The loans on mortgage amounted to more than \$63,199,490, and the bonds issued aggregated as much again. Private banking was represented by 138 joint-stock banks with a paid-up capital of \$45,133,636, and there were 537 chartered savings banks, controlled by the Minister of Finance, with over \$247,609,331 on deposit and 1,305,013 depositors.

Government, etc.—Norway is a constitutional and hereditary monarchy, the royal succession being in the direct male line in the order of primogeniture. If there is no male heir to the throne, the king may propose a successor to the Storting (or Legislative Assembly), the assembly reserving the right to nominate another if it does not approve the king's choice. On 7 June 1905, Norway declared its union with Sweden dissolved, and an agreement to this effect was signed 26 Oct. 1905. Prince Charles of Denmark was elected king 18 November, and accepted the crown as King Haakon VII 20 Nov. 1905. His wife, whom he married 22 July 1896, was Princess Maud, the third daughter of the late Edward VII of England. Their son, Prince Olav, Crown Prince, was born 2 July 1903.

The Constitution, or Grundlov, bearing originally date of 17 May 1814, and many times amended, vests the legislative power in the Storting which represented the sovereign power of the people. The king has the veto power, which may be twice exercised on a measure; but if the same bill passes three Stornings which have been assembled by separate and subsequent elections, it becomes law without the royal approval. The king commands the army and navy, and makes all appointments, but, except in a few cases, is not allowed to nominate any but Norwegians to public offices under the Crown. He exercises his authority through a Council of State, composed of one Minister of State and at least seven Councillors, who may be present in the Storting and take part in public discussions without voting. Local government is exercised by a chief executive functionary called the Amtmaend in each of the 20 districts into which the country is divided.

The ordinary revenues of the Crown, as shown by the budget for the year ending 30 June 1918, were \$64,844,000; extraordinary revenues, \$49,881,520; total revenue, \$114,725,520. The prospective expenditure, as listed in the budget of that time, including state railways, army, navy, post, telegraph, etc., church, arts and education, interest and redemption of public debts, etc., ordinary expenditures, \$64,844,-

000; extraordinary expenditures, largely defense and scarcity measures, \$69,881,520. For 1918-19 the budget provided for ordinary expenditure, \$83,850,000; extraordinary, \$15,537,374.

The most important fortresses of Norway are Oscarsborg and the new fortresses by Agdenes, Bergen, Tönsberg and Christiansand. The army of Norway is a national militia, somewhat resembling that of Switzerland. The navy consists of 4 war ships, 12 gunboats, 5 destroyers, 41 torpedo boats, some submarines and mine layers.

Ethnology.—The Norwegians are almost entirely of Scandinavian origin. They are about the middle height, light-haired and blue-eyed, sober and thrifty, honest and industrious, and where not devoted to a rural life have a strong passion for the sea, and make excellent sailors. The Finns or Lapons dwelling in Nordland, and more specially in Finmark, bear little resemblance to the Norwegians proper. The Qvaens, though dwelling in the same localities with the Finns, are very easily distinguished from them both by physical features and habits.

Population.—In 1910 the population was 2,391,782; males, 1,555,673; females, 1,236,109. Illegitimacy is somewhat high, averaging 8.5 per cent of the births. The Laps numbered 18,590, and Finns 7,172. The population is more rural than urban, only about one-sixth living in the towns. Emigration has decreased compared to former years, the number in 1916 being 5,212, of whom 4,865 came to the United States. From 1900 to 1910 the population of Norway increased by 151,750.

Education.—Primary education is compulsory, and is conducted on a national system, according to which gratuitous elementary instruction is placed within the reach of all. The schools, designated by the name of *almue skoler*, or people's schools, are stationed in all towns and parishes. In the country the instruction is only elementary; in the schools themselves an important distinction is made, some being what is called *fast skoler*, or stationary schools, and others *omgangs skoler*, or ambulatory schools. The latter, as their name implies, shift about at certain periods of the year, from place to place in the more thinly-peopled districts; and thus have the effect of bringing education to those who, but for this arrangement, would be doomed to live without it. Towns possess, in addition to these people's schools, what are called middle schools, middle and royal schools, burgher schools, Latin or learned schools, in all of which superior instruction is given; there are also four cathedral schools, one each in the towns of Christiania, Bergen, Trondhjem and Christiansand. At the head of all the educational establishments is the Royal Frederick University of Christiania, with five faculties, 63 professors and an average annual attendance of 1,550 students.

Religion.—The great body of the people are Protestants of the Lutheran confession. Though no express law prohibited other religious bodies from meeting for public worship, the popular feeling was for long so decidedly opposed to it that a law, permitting them so to meet, and form regular congregations under their own pastors, was passed for the first time in 1845. Recently there were 62,553 dissenters, including 10,986 Methodists, 7,659 Baptists,

2,046 Roman Catholics. The country is divided into six bishoprics (stifts), corresponding in name and extent with the administrative provinces, and into 902 parishes. With exception of the cathedral of Trondhjem, founded 1180 or 1183 A.D., and a few other churches which are stone edifices, the churches in Norway are generally built of wood. Many of them are very ancient structures, dating as far back as the 11th and 12th centuries.

Judiciary.—Norway is divided into 107 districts for the administration of civil justice. Of these districts each with an inferior court, 26 are urban, and the rest rural courts, each with one chief, and two other judges, and a *Höiesteret*, or Supreme Court for the whole kingdom, consisting of a president and a minimum of six other judges. In each town and district there is a *Forligelseskommission*, or court of mediation, consisting of two men chosen by the electors, before which civil cases are generally first brought.

History.—In the earliest times Norway was divided among petty kings or chiefs (jarls), and its people were notorious for their piratical habits (see NORMANS). Harold Fair Hair, who ruled from 863 to 933, succeeded in bringing the whole country under his sway, and was succeeded by his son Erick. He was ultimately driven from the throne, which was seized in 938 by his brother, Hako I, who had embraced Christianity in England. Magnus the Good, the son of Saint Olaf and Alfhiild, an English lady of noble birth, was called to the throne in 1036; and having in 1042 succeeded also to the throne of Denmark, united both under one monarchy. (See DENMARK). After his death the crowns of Norway and Denmark again passed to different individuals. In 1319 the crown of Norway and Sweden became for a short time united in the person of Magnus V. Erick of Pomerania succeeded, by separate titles, to Norway, Sweden and Denmark; and in 1397 was crowned king of the three kingdoms. Sweden then for a time became a separate kingdom; but the union between Denmark and Norway was drawn closer and closer, and very much to the disadvantage of the latter. The subsequent history of Norway becomes for a long period a part of that of Denmark. After the defeat of Napoleon by the allies in 1813 it was arranged by the Treaty of Vienna in 1814 that Denmark must cede Norway to Sweden, and the result was the union of the two countries under the Swedish Crown. The union has been accompanied with a certain amount of friction, partly owing to the entirely democratic character of the Constitution of Norway, in which country titles of nobility were abolished early in the 19th century. The right claimed by the king to veto absolutely bills passed by elected representatives met with an overwhelming protest by the people, the struggle lasting till 1884. In 1905 a grave constitutional struggle arose between the two countries, from the demand for greater independence for Norway in her foreign policy. The situation developed an acute crisis over the refusal of King Oscar to grant separate consular service to Norway. On 7 June the Storting passed a resolution for dissolving the union of the two countries, and after a period of strained relations and warlike preparations a treaty was drawn up at Karlstad, the Swedish Riksdag officially adopting it on

16 October, thus recognizing Norway's independence. On 20 Nov. 1905 Prince Charles of Denmark accepted the throne, taking the title of Haakon VII. In 1907 a treaty guaranteeing the integrity of Norwegian territory was signed by Great Britain, France, Russia and Germany, which was approved by Norway in 1908. In 1907 woman suffrage was adopted. During the European War 1914-18, strong feeling arose in Norway against Germany's ruthless submarine warfare entailing severe losses of Norwegian shipping and lives. On 29 Nov. 1917 a conference of the Scandinavian powers at Christiania was interpreted as the result of Norway's efforts to co-operate with Denmark and Sweden in the event of a declaration of war against Germany. See WAR, EUROPEAN; NEUTRALS AND THE WORLD WAR.

Editorial Staff of The Americana.

NORWAY, Me., town in Oxford County, 49 miles north of Portland and 17 miles northwest of Auburn, on the Grand Trunk Railroad. It was settled in 1786. Being in an agricultural and lumbering region, dairy-farming, livestock and fruit-growing and lumber products form the chief interests. There are also manufactures of shoes and hosiery. Pop. (1920) 2,208.

NORWAY, Mich., city in Dickinson County, on the Menominee River, 50 miles northwest of Menominee, and on the Chicago Northwestern and the Wisconsin and Michigan railroads. The city is a centre for iron-mining. The chief mines, with their valuable ore deposits, are the Argon and the Vulcan Iron Mountain, nine miles distant. The manufactories include repair shops and pulp mills. The falls in the river are utilized for power. The city has waterworks and an electric-light plant. Pop. (1920) 4,533.

NORWEGIAN LANGUAGE. The original Old Norse tongue which seems to have been spoken quite uniformly all over the North underwent, during the Viking Age (700-1100 A.D.), a process of gradual differentiation resulting in three distinct dialects: Old Norwegian, Old Swedish and Old Danish, to which after the settlement of Iceland has to be added Old Icelandic as a fourth. Old Norwegian and Old Icelandic stand very close to each other and are called West Norse in distinction from the other two East Norse dialects. West Norse shows tendencies toward assimilation of consonants (kk, pp, tt, where East Norse has nk, mp, nt), furthermore Umlaut where it does not appear in East Norse, the Medio-Passive ending -sk as compared with -s. As to the differences between Icelandic and Norwegian

the reader of Old Norse texts will notice that Old Norwegian prefers -i, -u in endings where Icelandic has -e, -o (though in later texts replaced by -i, -u). Initial h before l, n, r, is lost in Old Norwegian but retained in Icelandic (ringr vs. hringr—"ring"). The eastern dialects of Old Norwegian showed quite early Swedish characteristics, whereas the southwest was colored by Danish. These influences become more pronounced after Norway lost her independence, and from 1500 on Norwegian ceased to exist as a literary language, but survived in the country districts and in popular traditions. Our knowledge of the oldest type of Norwegian is based to some extent on loanwords which were taken over by the Lapps and Finns and are even to our day preserved in their original forms. Thus Finnish *kuningas* shows the primitive Norse form of Old Norwegian *konungr* (king). Next in importance are Runic inscriptions on stones, walls, coins and ornaments. The oldest Norwegian inscriptions are those of Einang and Steinstad (5th century). The oldest manuscripts date from the end of the 12th century and contain law codes, homilies, legends, etc. After the definite union with Denmark the official and literary language of Norway became Danish and remained so until the beginning of the 19th century. The older dialects were, however, spoken everywhere in the country districts and tended to modify the language of the educated classes, the so-called Dano Norwegian, in more than one respect. The pronunciation differed considerably from Copenhagen Danish, especially with regard to consonants and musical accent, and the vocabulary took over many words and phrases from the dialects, a process which continued throughout the 19th century and is part of the whole movement toward nationalization of Norway. Dano Norwegian in this form is the language of the great classics of modern Norwegian literature, like Ibsen, Björnson and Kielland. Others, like Lie, draw more from Nordland dialects.

Landsmaal Movement.—The natural development of Dano Norwegian seemed far too slow and inadequate to the more rabid patriots and nationalists. They had been investigating the peasant dialects especially of the Western districts and wondered whether it might not be possible to construct with the help of this linguistic material a distinctly Norwegian vernacular, entirely indigenous to the soil and relatively free from Danish elements. This unique idea soon found followers and resulted in a linguistic synthesis, as it were, which is now known as "Landsmaal" in distinction from the Dano Norwegian type of "Riksmåal." The movement was first started by the philologist, Ivar Aasen, about 1850 and supported by the journalist Vinje and the poet C. Janson. It entered upon a new phase about 1870, when several scholars like Fjörtoft and Höyem demanded that Landsmaal should be based on Eastern and Northern dialects as well as on Western and that it should not be archaic, but modern and practical in its whole character. This modified "Landsmaal" was adopted by Arne Garborg and a few other writers, and has since then, in spite of violent opposition, gained steadily ground in private life and public institutions. Its chief opponents are the adherents of Dano Norwegian who under the

leadership of Knud Knudsen insist that the language of a country ought to be the product of natural growth and not of enforced legislation. Whether "Landsmaal or New Norse" will ultimately become the national language of the whole of Norway seems as yet very doubtful. Out of 600 or more newspapers and periodicals only some 20 employed "Landsmaal" in 1917 and of a population of two million and a half hardly 300,000 live in districts where it has been introduced into public schools. Parliamentary proceedings are published both in "Landsmaal" and "Riksmåal," but the Chambers of Commerce declared in 1911 that they considered "Landsmaal" worthless for practical business purposes.

Accent.—Wordstress shows the same general characteristics as in other Germanic languages, but the musical accent or inflection follows peculiar laws and has no analogy except in Swedish. The sentence inflection or "tonefald" is rather monotonous in the east, but very animated and elastic in the west, notably in Bergen. The main accent in a sentence is rather lowpitched. As to word inflection or "tonelag" it shares with Swedish the peculiarity of being either simple or compound and of serving to differentiate between words which otherwise seem identical. Simple inflection corresponds to rising tone in English but shows more marked intervals varying from a musical second to a fourth. Compound inflection begins on the natural level, glides down a third in the first syllable and rises a fourth in the second. The details of stress and accent present perhaps the chief difficulty in learning the language.

Professor of German, University of Michigan.

NORWEGIAN LITERATURE. The literary life of Norway during the Middle Ages is closely bound up with that of Iceland, since many skalds or poets who were born in Iceland, including Sighvatr Thordarson, Hall-

fredr Ottarson and others, spent part of their lives at Norwegian courts. If we eliminate from the entire mass of Old Norse literature everything that is of Icelandic origin, few writers remain who deserve a place in the annals of Norwegian literature. It must be admitted, however, that large portions of the famous collection of heroic ballads and lays which goes under the name of the Older Edda, probably originated in Norway, as the tale of 'Smith Volund,' parts of the 'Havamal' and some of the 'Sigurd Songs.' The first historical name is that of Bragi (about 800) who in the 'Ragnarsdrapa' describes the mythical characters engraved on the shield which was given to him by King Ragnar of Denmark. Bragi was the first of the official skalds who held the position of a poet laureate at the courts of the Norwegian kings. Other court poets were Thornbjörn Hornklofi and Thjodolf of Hvin, both unusually gifted, but unfortunately their best works 'Glymdrapa' and 'Haustlög' have only come to us in fragments. One of the most famous skalds was Eyvindr Finnsson whose splendid 'Hakonarmal' was included by Herder in his collection of world poetry, 'Stimmen der Völker.' After the death of King Harald Sigurdarson (1066), who was himself gifted as a poet, the art of the skalds degenerated more and more into empty formalism. The rich prose saga literature of the North is almost entirely of Icelandic origin. There seems to have been, however, considerable activity in Norway during the first half of the 13th century in the field of translations and adaptations of chivalrous epics and romances. This kind of imitative literature flourished particularly under King Sverre and King Hakon the Old (d. 1263). Such adaptations are the 'Thidreksor Vilkinasaga' (very valuable as a source for the Theodoric-and Nibelungen legend), furthermore the 'Karlsmagnussaga,' the romances of 'Flores ok Blankiflur,' of 'Tristram ok Isold,' the legend of 'Barlaam ok Josofat' and many other treatments of material imported from the South. Of special importance for our knowledge of customs and manners of mediæval Norway is the 'Speculum regale' or 'King's mirror' in which a father gives his son instructions in matters of conduct and good taste,—a curious forerunner of the Cortigiano and Lord Chesterfield's letters. The extensive ballad literature which flourished especially in Denmark and Sweden during the 14th and 15th centuries found less response in Norway and least of all in Iceland, whereas a later type of folksong built on the stanza of four short lines, the so-called *stev*, remained popular in Norway into our days, collected by S. Bugge, 'Gamle norske folkeviser' (Christiania 1858).

The constant dissensions and feuds of pretenders and other disasters like the ravages of the Black Death may account for the decline of national ambition and racial vitality in the later Middle Ages. In 1397 the three Scandinavian realms were bound together by the Union of Calmar, and while Sweden very soon regained her independence, Norway was gradually reduced to the status of a Danish province. Language and literature became Danish and whatever there was left of literary ambition gravitated in the direction of Copenhagen. Many prominent writers who figure now in the

annals of Danish literature were born in Norway, above all Ludvig Holberg, the great dramatist and philosopher. Among those who remained loyal to the Norwegian soil was Peder Dass (d. 1708), the most popular figure of his age, author of various descriptive poems like the famous 'Nordlands Trompet' and the 'Norske Daleviser,' anticipating the style of Thomson and Brockes. The influence of Pope and Thomson is still more noticeable in the works of Chr. Tullin (d. 1763), author of didactic poems and praised by Lessing on account of his wedding poem, 'Maidagen.' He is usually classed as a Danish poet. E. Storm (d. 1794) was the first to strike a national note in his ballads and fables which were written in a Norwegian peasant dialect. The most important event in the direction of a national rebirth was the founding of the Norwegian Society in Copenhagen in 1772 for the purpose of encouraging and stimulating national Norwegian literature and life. Johan Wessel, although now classed as a Danish writer, was one of the leaders of this movement. Other prominent members were the brothers Claus and Peder Frimann, very popular on account of their poetic descriptions of the life of the sailor, 'den syngende sømand.' J. N. Brun (d. 1816) was the author of the classic tragedy 'Zarine,' remembered now chiefly because it gave rise to Wessel's famous parody, 'Love without stockings.' Brun wrote many patriotic and religious songs, and as a preacher stimulated greatly the awakening of national consciousness. Claus Fasting was active as critic and epigrammatist. J. Zetlitz cultivated the Anacreontic style and Enevold Falsen held the stage for quite a while with his comedy 'Dragedukken' (1797).

Modern Norway, both as a political and intellectual power, dates from the year 1814, the year of the separation from Denmark. All the latent energy and vitality which had been stored up for centuries seemed to awaken suddenly and to demand an outlet. The building up of a genuine Norwegian type of civilization was the aim and ideal of the progressive minds of the country. First among them stands Henrik Wergeland (1800-45), a strange mixture of enthusiasm and awkwardness, of idealism and lack of good sense. His most ambitious work, 'Creation, Man and Messiah,' is on the whole less attractive than some of his short poems like 'The English Pilot,' 'The Jew' and 'Jan van Huysum's Blomstestykke.' Wergeland's radical nationalism caused a literary feud somewhat similar to that of the Phosphorists and Gothicists in Sweden, but it was even more intense. Wergeland's chief adversary was Joh. Welhaven (1807-73), a poet of broad culture and æsthetic refinement, who believed rather in a gradual evolution of national ideals and who wished to maintain closer relations with Denmark and the larger European currents of thought. In a series of sonnets, 'Norges Daemring' (1834), he attacked the narrow provincialism and unbridled pathos of the Wergeland party most vigorously. Welhaven's influence upon the whole intellectual development of his country reached far into the century, whereas Wergeland was hailed by the political radicals and young enthusiasts as their inspiring genius. The antagonism between these two parties is reflected to some extent, in the relation between the cosmopolitan, intellectual Ibsen

and the more impulsive nationalistic Björnson. Welhaven's æsthetic culture shaped the poetic style of Andreas Munch (1811-94), whose subjects are, however, rather in the romantic vein, as his charming epic, 'Kongedatterns Brude-fart.' Two scholars whose activity corresponds in many respects to that of the brothers Grimm in Germany were P. Asbjørnsen and Jörgen Moe, editors of a valuable collection of fairy tales, 'Norske Folkeeventyr' (1842). Few literatures can boast of such an inexhaustible supply of mythological characters, elemental spirits and grotesque inventions in which a vivid imagination and a keen sense of humor are delightfully mingled. Another literary genre which has been very productive in Norwegian literature is that of the peasant tale and descriptions of country life. The following writers have contributed to this field: Nicolai Oestgaard, translator of some of Auerbach's village tales, but in his own sketches far more realistic; Bernhard Herre, 'Recollections of a hunter'; Harold Meltzer, 'Little pictures from the life of the people'; Magdalena Thoresen, 'Pictures from the Westcoast; the Land of the Midnight's Sun'; Jacob B. Bull, 'Pictures of Norwegian Life'; Kristian Elster, one of the most gifted writers in this field, dealt also with social problems in his novel, 'Dangerous People.' As a pathfinder in the whole question of woman's social position should not be overlooked Camilla Collett (1813-95), whose novels, 'The Bailiff's Daughters' and 'From the Camp of the Dumb,' stimulated Ibsen's treatment of this subject.

We have reached the most brilliant epoch in the literary life of modern Norway, whose four leading writers, Ibsen, Björnson, Lie and Kielland, will receive special treatment at the proper places. All four are realists, but they differ considerably in their specific aims and methods. Kielland, chiefly known through his novels 'Skipper Worse,' 'Abraham Lövdahl' and his 'Tales from Two Countries,' takes a critical or sceptical attitude toward human society; Lie appears in his best works, 'The Pilot and his Wife,' 'The Visionary,' 'Barque Future,' as a big-hearted sympathetic observer of human nature and as a poet of great imaginative power; Björnson developed from a naïve realist and storyteller into a champion of social emancipation, and, with his wide range of interest, may be regarded as the very epitome of the whole cultural development of modern Norway; Ibsen, finally, is recognized to-day as the greatest dramatist since Shakespeare, as a constructive interpreter of the relation between society and the individual and as a guide in determining our moral rights and responsibilities.

Contemporary Norwegian literature seems to incline rather toward the realistic and naturalistic interpretation of life and shows on the whole quite a sombre complexion. One of the most powerful writers is Knut Hamsun (b. 1860), who, owing to many discouraging experiences, views life without and within as a bitter struggle, from the first pangs of 'Hunger' to the resignation of 'Muted Springs.' The chief works of his earlier period, 'Hunger,' 'Mysteries,' 'Pan and Victoria,' reflect the tumultuous career of an intellectual vagabond who like his hero, Nilson Nagel, without apparent purpose or aim, speculates on the

deeper relations between life and nature, freedom and fate, and who mercilessly tears the mask from everything that does not stand the test of truth and reality. Among his plays 'Munken Vendt' stands out on account of its fine spiritual enthusiasm and its masterly form. His later novels are superior in plot and finish, but lack the primitive strength and spontaneity of his first books. Hamsun was thoroughly familiar with American conditions and introduces in many of his stories American settings. His book, 'Intellectual Life in Modern America,' contains some severe criticism. Arne Garborg (b. 1851) is another truth seeker, but less concrete and brilliant than Hamsun, more absorbed in religious and social problems. He is determined to free his people from the hardness and gloom of Pietism without sacrificing the real substance of Christianity. His book, 'Peace,' takes up the Brand problem but from a more human and practical point of view. 'The Lost Father,' one of his most searching confessions, offers in place of the lost Fatherhood of the old God the new gospel of the Brotherhood of Man. 'Wearied Souls' contains in form of introspective analysis reflections on the utter hopelessness of our whole existence and is one of the most harrowing accounts of this kind of mental bankruptcy. 'Bondestudenten' (Peasant students) tells the story of a certain type of student who after periods of doubt and struggle settles down to a life of material comfort. 'Mannfolk' gives a realistic picture of the Bohemian life of Christiania. Garborg is one of the few writers who employ 'Landsmaal.' Amalie Skram (d. 1905) is the third of the great naturalists. Her novel, 'Afkorn' (Offspring), deals with the depressing subject of transmitted curse in the modern form of inherited weakness. 'Foraadt' (Betrayed) is a story of marriage and separation, keen and forceful, but painfully disillusioning. The leading character, a strangely unresponsive and even frigid woman, occurs repeatedly in Amalie Skram's stories. 'Two friends' is a sea tale and presents in the chief character a more human variation of the Peer Gynt type. Amalie Skram was first married to a sea captain with whom she made many voyages, and later to the Danish author Erik Skram. In some respects Gabriel Finne (d. 1899) is perhaps the most consistent naturalist, author of the novel 'To Damer' (Two Ladies), in which the duel of the sexes is treated somewhat in the physiological manner of Strindberg. In his best play, 'Uglen' (Owl), he attacks the same problem more critically from the point of view of guilt and retaliation. Sigbjørn Obstfelder (d. 1900), a mystic and brooding mind, betrays Russian influence. 'The Cross,' a story of woman's suffering through passion and guilt, suggests Dostojevski's 'Krotkaja.' It is a relief to turn from the gloomy pessimism or questioning attitude of so many of these writers to a sunny temperament like that of Hans Aanrud, author of numerous stories and sketches from peasant life, and an artist in describing the subtler moods of nature.

Among contemporary novelists also occur the names of Jens Tveldt, author of 'Venheppa' and 'Brite Per,' a Westlander, who has faith in the vitality and regenerative power of his race; Theodor Madsen, a naturalist, who in 'God's Finger' describes an unhappy mar-

riage, in another novel, 'Under the Tree of Knowledge,' a modern Faust type and searching intellectualist; Thomas Krag, psychologist and connoisseur of women, 'Kobberslangen,' 'Ada Wilde,' 'Gunvor Kjeld'; Hans Jaeger, who attained notoriety through several confiscated books, especially his sketches from the Bohemian life of Christiania; Hans Kinck, equally at home in West Norway and Italy, author of numerous impressionistic tales and sketches; Johan Bojer, another naturalist, best known through his novel, 'The Power of Faith,' a story of truth and illusion; Mons Lie, son of Jonas Lie, who in his novels, 'Adam Ravn' and 'Man overboard,' broods over life's unseen forces and ultimate values; Bernt Lie, nephew of Jonas, seems to have fallen heir to his uncle's warm-hearted, sunny disposition, 'Hildir,' 'Sister Judith.' Finally, two women writers: Alvide Prydz, interested in problematic characters, 'Dream,' 'The Promised Land,' and Anna Munch, who brings the message of harmony and happiness in her novels, 'Ruler of the World' and 'Joyfulness.' Only a few lyric poets of more than average ability are to be noted. Garborg's 'Haugtussa' and 'I Helheim' are attempts to revive the old ballad spirit and heroic grandeur of the Eddic poems. The most gifted among the younger poets is Nils Collett Vogt, an enthusiastic worshipper of life, and in his style somewhat influenced by Swinburne, 'From Spring to Autumn'; 'Music and Springtime.' The æsthetic tradition of Welhaven seems to reappear in Th. Caspari's lyrics, whereas Per Sivle's impressionism reminds of Wergeland's style. The versatile genius of Vilhelm Krag won its first laurels with a volume of poems (1891) which found at once recognition on account of their exquisite form and strong individuality. V. Krag has done excellent work in many fields. In his novel 'Homesickness' he tells the story of his own inner development; he has been active as essayist, critic, stage manager and written several good plays, notably, 'Life a Play,' with a chivalrous setting. The most interesting figure on the modern Norwegian stage is Gunnar Heiberg (b. 1857), less gifted as a psychologist than as a keen observer of life, a brilliant causer and passionate temperament. In 'Kong Midas' and 'Folkeraadet' he furnishes political satires in the manner of Ibsen's 'League of Youth.' His two best plays are 'The Balcony' and 'Love's Tragedy,' both studies of romantic love and disillusionment. Two sparkling comedies are 'Jakob og Kristoffer,' by Peter Egge, and 'The Day of Reckoning,' by Nils Kjaer, one of the most popular feuilletonists of the day.

Among the writers who employ 'Landsmaal' should, in addition to Arne Garborg, be mentioned Vette Vislie, 'Solvending,' a prose poem of guilt and redemption; Ivar Mortensen, 'Varg i Veum,' a play in the declamatory sagastyle; Rasmus Løland, author of stories and sketches with rather depressing themes.

Bibliography.—The best Norwegian work is by Jaeger, H., 'Illustreret Norsk litteraturhistorie' (2 vols., Christiania 1896 et seq.). A shorter treatment by Bing, J., 'Norsk litteraturhistorie' (Copenhagen 1904). For contemporary literature Naerup, C., 'Illustreret norsk litteraturhistorie, 1890-1904' (Christiania 1905);

Christensen, Hj., 'Vort litterære liv.' (Christiania 1902). For general reference: Halvorsen, 'Norsk Forfatter lexikon, 1814-1880' (6 vols., Christiania 1885 et seq.). The only English treatment is Horn's 'Scandinavian Literature' (trans. by R. Anderson, Chicago 1884; entirely inadequate for the modern period). An interesting though rather incoherent essay on modern Norwegian literature by Bjørnson in the *Forum*, Vol. 43 (1910); Gosse, 'Northern Studies' (London 1883) gives a brief introduction into Norwegian poetry since 1814. Many valuable monographs on Norwegian writers have been contributed by Georg Brandes and are found in his collected works. Important for the whole field are the *Publications of the "Society for the Advancement of Scandinavian Study"* (Urbana, Ill.). Popular articles occasionally in the *American Scandinavian Review*, published by the American-Scandinavian Foundation, New York.

EWALD A. BOUCKE,

Professor of German, University of Michigan.

NORWEGIAN MUSIC. Norwegian music is sometimes classified with Scandinavian music but this is wrong. Norwegian music is in a class by itself. Norwegians are extremely tenacious of their national life. Foreign music and literature never had the same influence in Norway as they had in Sweden and Denmark. The opera and musical comedy never took root in Norway. The people have always clung to their simple melodies and folksongs. The consciousness of national life awoke in 1772 when the Norwegian Society, a band of patriotic Norwegians living in Copenhagen, Denmark, combined to found a university in Christiania (which was accomplished in 1811), and to recover their native independence (1814). Poets, historians, collectors of folktales and folksongs did valuable work in preserving the national inheritances that had been handed down from generation to generation by tradition. Until the end of the 18th century, therefore, the only musicians in Norway were simple unsophisticated peasants, who, like the wandering minstrels of the Middle Ages, traveled from place to place to play in such houses, or before such people, who would receive, or listen to, them. The songs they sang were of the simplest kind and the instruments they played upon to accompany the songs and dances they gave were of the most primitive pattern.

Instruments.—First should be mentioned the old Norwegian violin with four strings tuned in three peculiar ways A, D, A, E; A, E, A, E; or A, E, A, C, sharp C. This peculiar tuning for the purpose of accommodating the instrument to the tone form of three old modes—the Phrygian, the Hypodorian and the Hypolydian—the influence of which is very perceptible in early Norwegian music. There is also a little violin called the Hardangerfele, probably named after Hardanger Fjord, where it is generally played. This little violin is usually ornamented with paintings, or carvings. Sometimes it has both. The scroll is often carved in the shape of a human head, or in the form of a unicorn or a griffin. Beneath the four catgut strings lie metallic springs, or wires (sympathetic strings), that vibrate when the other strings are set in motion. The bow resembles that of an ordinary double-bass bow;

but it is of course much smaller. The Krog-harp is an antique and uncouth instrument with a sound-board and metal strings. It is capable of producing great emotional effects and is peculiarly fitted to express the weird, melancholy Norwegian melodies. It is still a favorite with the peasantry. The Langleike is an old-fashioned dulcimer and is played with a plectrum made of wood, or fish bone. The Nyckelharpe is a kind of keyed dulcimer or violin, resembling the hurdy gurdy or organistrum that was played by the wandering minstrels of all countries in the Middle Ages. The Kantele is a kind of lyre; the Lur is a wooden trumpet; and the Norwegian pipe is a simple tube with holes, made from the bark of the mountain oak.

Primitive Songs and Dances.—The melodies played upon these primitive instruments were songs, hymn-tunes and dances of the simplest nature, but very individual with regard to their rhythms and peculiar intervals. Among the songs are simple ditties descriptive of various avocations, or appropriate to the different seasons. Thus there are shepherd songs, reaping songs, angling songs, mowing songs, winter songs, descriptive of the beauties of the snow and ice and spring songs which "told of the melting frosts, the opening buds and the delicious perfume which bathes Norwegian hills when the sun and the leafage of the trees are hastening on to summer." Of the dances so characteristic of Norway the most important are the *Spring dans* (springing dance); the *Ganger* (walking dance) and the *Halling*. The *Halling* is the most characteristic dance of Norway. Its name comes from the town of Hallingdal between Christiania and Bergen. It is well described in Frederika Bremer's novel 'Strife and Peace' as follows: "Perhaps there is no dance which expresses more than the *Halling* the temper of the People who originated it. It begins with little hops, accompanied by movements of the arms. It is bear-like, clumsy, indolent, and half dreaming. But it wakes and becomes in earnest. The dancers suddenly begin to dance throwing off their indolence and clumsiness and exhibit strength and dexterity. The same person who a moment ago seemed fettered to the earth now throws himself with springs of agility into the air as though he had wings. Then after many evolutions which make the unaccustomed spectator positively dizzy, the dancer assumes his indolent clumsy character and ends the dance as he began it." Björnsterne Björnson also gave a fine description of the *Halling* in his novel 'Arne.' The *Halling* is generally danced by single dancers, or by two or three dancing in competition. The music is generally written in 2-4 time and in a major key and is usually played on the *Hardangerfele*.

Composers.—About the end of the 18th century F. C. Groth and Andreas Flintenberg began, with very little musical culture, it is true, but with praiseworthy industry, to compose cantatas. At the same time organists in towns and in the country also began to preserve the traditional tunes that had been handed down orally. One of these, L. Matthias, gathered 540 old Norwegian songs and dances which would otherwise have perished. L. M. Lindemann was another who collected the national melodies of his country. Thrane, who lived in

the beginning of the 19th century and who was educated in Paris, began to compose in a vein that might be termed national. He broke the ice, as it were, for Halvdan Kjerulf (1815-68), who strove to express, in addition to the charms of his country and its scenery, the national aspirations toward liberty that were throbbing throughout Norway. Kjerulf associated himself with Björnsterne Björnson who wrote the words for many of Kjerulf's melodies, which enjoyed enormous popularity. Kjerulf's songs have been compared to those of the German, Robert Franz. His accompaniments are well written and are often treated polyphonically. His two books of songs 'Sänger och Visor' are much admired. One song, 'My Heart and Lute' is very popular. Next to Kjerulf comes Rikard Nordraak (1842-66), who did much for the cause of national music, not the least of which was his influence upon Grieg. Nordraak composed the Norwegian national anthem. He was a cousin of Björnsterne Björnson.

To this period belongs Ole Bull (1810-80), the most famous violinist and the foremost Norwegian musician of his time. His reputation as a violin virtuoso remains undiminished, but it is not generally remembered that he founded the National Theatre at Bergen and persuaded Ibsen to become its director and infused his personal enthusiasm into the work of Grieg and other Norwegian composers. The Norwegians divide their music into four periods: (1) the *Folksong*; (2) the Old Romantic from Thrane to Kjerulf; (3) the Romantic; and (4) the New Romantic, reaching to the present time.

The great trio of modern Norwegian composers—Grieg, Svendsen and Sinding—strike their roots in all four periods, as they are pre-eminently the exponents of the Norwegian soul.

Edward Hagerup Grieg (1843-1907) returned from Leipzig to figure as a great revolutionist in the music of his country. He became intimate with Rikard Nordraak and until that composer's death in 1866 the two worked together to foster a veritable Norwegian school of music. In 1864-65 Nordraak founded the Euterpe Society in Copenhagen, the object of which was to bring forward the works of young Northern composers. In 1867 Grieg founded a musical society in Christiania which he conducted until 1874, when he was succeeded by John Svendsen. But even more as composer Grieg gave impetus to Norwegian music. His compositions breathe the poetry of his native country and express the spirit of the land and of its people. He himself wrote: "The fundamental trait of Norwegian folk-song is a deep melancholy which may suddenly change to a wild, unrestrained gaiety, mysterious gloom and indomitable wildness—these are the contrasts of Norwegian music." Of all Grieg's works his incidental music to Ibsen's 'Peer Gynt,' often played in concert halls as a suite, has perhaps made him known to the world as a fascinating and original composer. In his songs, piano pieces and orchestral music Grieg is a true representative of his country and of his race. Next to the 'Chopin of the North' as Grieg is called comes Johan Svendsen (1840-1911), son of a military bandmaster, and who after an education in Leipzig and Paris returned to Christiania and wielded great in-

fluence in the musical life there as conductor and composer. His 'Norwegian Rhapsodies' for the orchestra and 'Romance' for violin and orchestra enjoy world-wide popularity and are full of the charm and local color peculiar to Norway. His setting of 'Sigurd Slembe' (words by Björnson) carries the idea of Norwegian music still further. Christian Sinding (b. 1856) is ranked by some critics above Svendsen and by other critics below him. Sinding has written suites, concertos, serenades, trios and a very beautiful 'Suite of Antique Form.' Sinding's songs are regarded by the best critics as masterpieces of their kind as they abound in melodic ideas and respond to all phases of national thought and emotion. Next comes Johan Selmer (1844-1910), a pioneer in the New School of Norwegian music. His fondness for bold, large outlines and bizarre themes has caused him to be called the 'Berlioz of the North.'

Among the more recent Norwegian composers should be mentioned Johan Haarklou (b. 1847); Catherinus Elling (b. 1858); Gerhard Schjelderup (b. 1859), inspired by native scenery as in his 'Midsummer Night on the Fjord' and 'A Sunday Morning'; Sigurd Lie (1871-1904), famous for his 'Easter Suite'; Ole Olson (b. 1850), who has produced an oratorio, 'Nidaros' (1897), and operas, including 'Leyla' (1908); and Johan Halcorsen (b. 1864), who has written suites, violin pieces, music for several dramas and the 'Coronation Cantata' for King Haakon. Consult Finck, Henry T., 'Grieg and His Music' (New York and London 1909); Bull, Sara C., 'Ole Bull' (Boston 1883).

NORWICH, nôr'wich, Conn., city, county-seat of New London County, at the junction of the Shetucket and Yantic rivers where they form the Thames, at the head of navigation on the Thames, and on the New York, New Haven and Hartford and the Vermont Central railroads, about 14 miles from Long Island Sound, and 40 miles southeast of Hartford. It was settled in 1659 by a company of English from Saybrook, and the place was named after Norwich, England. It was incorporated as a township in 1685, and chartered as a city in 1784, and rechartered in 1871. Its surface is irregular and it is surrounded by picturesque valleys and hills. The land around is productive but its exceptional water-power advantages have contributed to the extensive development of manufacturing industries. The chief manufactures are firearms, leather, silk fabrics, cotton and woolen goods, machinery, stoves, iron and iron products, and furniture, leather and belting, and woodworking machinery. It has a large trade in its own manufactures, lumber, farm products, coal and clothing and food supplies for the interior of western Connecticut. It is the industrial and commercial centre of a large portion of New London and Windham counties. The educational institutions are public and parish schools, the Free Academy, built and endowed by public-spirited citizens, the Art Museum connected with the Academy, and the Otis Free Library, which has about 30,000 volumes. The prominent buildings are the Slater Memorial Hall, the State Armory, State Insane Hospital, the William Backus Hospital, the Y. M. C. A. building, the courthouse and Saint

Patrick's Roman Catholic Church. There are several good church buildings and a large number of handsome residences. The Indian burying ground which contains the grave of Uncas, the place where Miantonomoh fell, the ruins of colonial homes, the places where once lived the Huntingtons, and others prominent in Revolutionary times, are all of historic interest.

The revised charter of 1877 provides for a mayor, who holds office two years, and a council of 12 members, six of whom are elected each year. The city owns and operates the waterworks, gas and electric plants. Pop. 29,032. Consult Caulkins, F. W., 'History of Norwich' (Hartford 1866) and Gilman, W. C., 'Celebration of the 250th Anniversary of Settlement of the Town of Norwich' (Norwich 1912).

NORWICH, nor'ij, England, episcopal city, county and parliamentary borough, capital of Norfolk County, on the river Wensum, 108 miles northeast by north of London (114 by rail) and 19 miles west of Yarmouth. The city proper extends more than a mile and a half in length from north to south on both sides of the Wensum, and a mile and a quarter in its greatest breadth. The geological formation consists of chalk, upper drift and crag; beds of sand and gravel.

Industries.—The great Colman factory—mustard, flour and starch—represents the most important industry in Norwich, the premises on the river front extending three-quarters of a mile. Boot and shoemaking, brewing and the making of agricultural implements are prominent manufactures, and Norwich has one of the largest organ manufactories in Great Britain. The cattle market is one of the largest in England.

Public Buildings, etc.—The great Norman Castle was probably built by William Fitz Osbern, one of the Conqueror's captains, as a place of arms and to overawe the subject Saxons. The keep, which remains, is nearly square, 92 by 96 feet, and 76 feet high; it is only exceeded in England by the Norman keep at Colchester. Long used as a prison it is now a museum and art gallery, in which are valuable ornithological specimens.

The cathedral is a grand Anglo-Norman pile, 407 feet long, and 72 feet broad, the spire reaching 315 feet from the ground (the second highest in England). It contains several ancient chapels, a beautiful choir, and the cloisters are the most spacious in England except Gloucester. The Erpingham Gate and Saint Ethelbert's Gate, which give entrance to the upper close, are of considerable interest. In 1272 a great part of the church and the adjoining monastery were burned by the citizens and many of the ecclesiastics killed. The Bishop's Palace, north of the cathedral, built by various prelates, is an extensive edifice. Saint Andrew's Hall, anciently the nave of the church of the Dominicans (Blackfriars), is a noble perpendicular structure, saved from spoliation by Henry VIII through the public-spirited action of Augustine Steward, thrice mayor of Norwich. It is now one of the handsomest civic halls in England; the walls are decorated with a number of valuable portraits, especially Beechey's 'Nelson,' with others by Gainsborough, Lawrence, Opie, etc. The Guild Hall, succeeding the Tolhouse,

where the king's tolls were paid, was built in 1413. This ancient city abounds in quaint relics of the past, and is notable for its antiquities and curios. One of the show-places is Hercules and Samson House (Cubitt's), a large and very ancient mansion facing the cathedral, the portico supported by ponderous figures of Hercules and Samson. It has great historical associations; its paneled rooms are filled with a choice collection of antique furniture, old china, and curios of every kind. The Strangers' Hall, an ancient building, is a local museum containing many interesting exhibits.

The uninteresting Shire Hall contains several portraits. There are barracks, a corn exchange and agricultural hall. The Norfolk and Norwich Hospital (1771) has been greatly extended of late years. The Jenny Lind Children's Hospital was founded by the great songstress in 1853; and the new infirmary was opened in 1900. There are two good libraries: Norfolk and Norwich Subscription and the Free Library.

Churches.—Apart from the cathedral, Norwich, with its suburbs, has 40 Anglican churches. That of Saint Peter's Mancroft contains the tomb of Sir Thomas Browne, author of the 'Religio Medici.' The chief churches of the Independents, Baptists and Presbyterians, are large and well attended. Before the Black Death in 1349 Norwich city had twice as many churches as to-day, and came to be called 'the City of Churches.' A magnificent Roman Catholic church, opened 1894, was built by the munificence of the 15th Duke of Norfolk. This city had five bridges in the 13th century; there are now 11.

Educational Facilities.—Norwich grammar school occupies a chancel-house (Bishop Salmon 1325) transferred there and to adjacent buildings at the Reformation. There are also the commercial school, divided from the grammar school, and a large technical institute.

History.—The earliest mention of Norwich in any record tells of conflict between Saxon and Dane, and is the statement in the 'Saxon Chronicle' that in 1002 'Swegen came with his fleet to Northwic and wasted a burned the burh.' With the Norman Conquest came the building of the castle, and in 1101 the dedication of the cathedral by Losinga, first bishop of the diocese. The most stirring events in Norwich arose from the Laborer's Revolt in 1381, and Kett's Rebellion in 1549, both of which were rigorously suppressed. The Black Death, 1348-49, swept away a third of the inhabitants of Norwich, and the plague of 1665-66 resulted in about 3,000 deaths. This British Norwich is almost certainly the parent city of Norwich, Conn., for Miss Mary Perkins in her history of the latter (1895) says: 'The Mohegan Indian fort may have suggested castle-crowned Norwich to the brothers Huntington, who are supposed to have emigrated from Norwich, England.' The first charter was granted in 1194. The city returns two members to the House of Commons. Pop. 121,478.

Bibliography.—*Early History:* Blomefield, 'Norwich' (1745); 'Records of the City of Norwich' (Vol. I, 1906), published by authority of the corporation; Hudson, 'How the City of Norwich Grew into Shape' (1896); *Modern History:* Rye's 'Norfolk' (1885); Mackie, 'Norfolk Annals' (a chronological record, 2

vols., 1901); Bayne's 'History of Norwich' (1898); Quennell's 'History of the Cathedral' (1900); and Hawkins, C. B., 'Norwich: a Social Study' (1910).

JAMES HOOPER,
Author of 'Guide to Norwich,' etc.

NORWICH, N. Y., city, county-seat of Chenango County, on the Chenango River, and on the Delaware, Lackawanna and Western and the New York, Ontario and Western railroads, about 52 miles in direct line south by west of Utica and 42 miles north by east of Binghamton. It is the industrial and commercial centre of a productive agricultural region. The chief industrial establishments are factories manufacturing hammers of all kinds, drugs, patent medicines, cosmetics, perfumery, knit underwear, interior woodwork, silos, wire baskets, condensed milk and gloves. There are also railroad shops, machine shops, foundries, creameries and stone quarries in Norwich. Norwich has a free public library, city hospital, county buildings, Old Ladies' Home, Y. M. C. A., seven up-to-date school buildings, eight churches and two national banks. Pop. 8,342.

NORWICH UNIVERSITY, situated at Northfield, Vt. It was first chartered (1819) under the name of American Literary, Scientific and Military College and was situated at Northfield, Vt., was moved to Middletown, Conn., in 1824 and in 1829 it was moved to Norwich; and the name changed to Norwich University in 1834. Fire destroyed its buildings in 1866 and the institution was removed to Northfield. The usual collegiate courses are offered; and in addition courses in civil and chemical engineering and military science; military drill is also a part of the curriculum. The chief work of the university has always been in science and engineering, and in 1898 it was made the official State military school, and receives a State appropriation. The degree of bachelor of arts and bachelor of science are conferred. Admiral Dewey was a student of Norwich. In 1922 the annual income amounted to \$152,430; the students numbered 276 and the faculty 26.

NORWICH CRESTED CANARY. See CANARY.

NORWOOD, Mass., town in Norfolk County, on the New York, New Haven and Hartford Railroad, about 12 miles southwest of Boston. It has a large printing establishment, a railroad repair shop, foundry, tanneries, leather, glue and ink factories, machine-shops and furniture factories and national and co-operative banks. The educational institutions are the Morrill Memorial Library which contains about 8,000 volumes and the public schools, high and elementary. The town owns and operates the waterworks and lighting system and has the benefits of the Norwood Civic Institution, a property valued at more than \$70,000, which is held in trust for the inhabitants. Formerly administered by annual town meeting, Norwood in 1915 was the first town in Massachusetts to adopt the commission-manager form of government. Pop. (1920) 12,627.

NORWOOD, Ohio, city in Hamilton County, on the Pennsylvania, the Baltimore and Ohio Southwestern, the Cincinnati, Lebanon and Northern and the Norfolk and Western railroads, northeast of and adjoining Cincinnati.

It was settled in 1804, incorporated as a village in 1898 and chartered as a city in 1903. It is a beautiful residential hill-suburb of Cincinnati, and also a manufacturing city of considerable importance. The chief industrial establishments are playing-card factory, the elastic book-case works, electric manufacturing works, washing-machine factories, foundry, piano factory, millwork works, tool factory, iron works, safes and vault works, enamel sign works, lithography works. Several of the manufacturing companies have buildings of considerable architectural merit. Other notable buildings are the town-hall, Enterprise Block, Knights of Pythias Hall, Carnegie library, the bank building and the eight churches. The educational institutions are five public schools (fine buildings), one parish school, and there are branch libraries of the Cincinnati public library. The government is vested in a mayor, a council of eight members and a board of public service consisting of three members, all elected by the people. The city owns the electric-lighting, sewage and water supply plants. The population is mostly native-born Americans; some are of German descent. Pop. (1920) 24,966.

NOSE, that part of the face of man and the higher animals which is included in the mechanism of respiration, containing avenues for the passage of air to the lungs, and which also contains and accommodates the organs of smell; in a broader and looser sense, the muzzle. The nose in most animals is the most prominent feature of the face—least so in monkeys and lemurs, not much prolonged in the cats, but an important part of the prolonged muzzles of other carnivora, and of the long-headed herbivorous animals generally. In several kinds of animals, otherwise widely diverse in structure and relationship, the fleshy part of the nose has been extended, through similarity of required service, into a more or less prolonged proboscis, as in the pigs, some shrews, certain seals, and most prominently the elephants. In these cases the nose performs other services than its usual functions and becomes a tool for rooting, an organ of prehension, etc.

In structure, the nose consists of a series of bones of the face (see **SKULL**), together with certain cartilages, forming a tube or tubes holding the paired olfactory surfaces and nerves. The cavities of the nose are the two anterior nares, which open externally by the nostrils (in some of the lower animals, as the cetaceans, joined into a single one, the "blow-hole"); and the posterior nares, which are within the bones of the face and open interiorly into the mouth at the top of the windpipe. These cavities are separated by a more or less continuous cartilaginous partition called the septum, which is perforated by apertures for the transmission of bloodvessels and nerves. Occasionally the two nasal fossæ or cavities communicate with each other.

The muscles which are concerned in the movements of the nasal cartilages include the triangularis (or compressor) nasi, which arises by its apex from the superior maxillary bone, and is inserted into a fibrous aponeurosis spreading over the front ridge of the nose. The fibres of the muscle of one side may unite with those of the opposite and companion muscle. The depressor alæ nasi of each side also arises from

the superior maxillary bone, and is inserted into the septum and posterior part of the alæ of the nose. The former of these two muscles appears to increase the breadth of the nose, and thus may open, dilate or expand the nostrils; the action of the latter muscle is that of a true compressor of the nostrils, each of the depressors drawing its ala or side of the nostril downward. The levator labii superioris alæque nasi lies on the side of the nose, between the inner side of the orbit and the upper lip. When in action this muscle dilates the nose, raises the upper lip and alæ of the nose; its use being well seen in the expression of a derisive smile and in the wrinkling of the skin at the angles of the nose and mouth.

The skin of the nose is of delicate and smooth character. The papillæ or minute elevations of the true skin in the neighborhood of the nose are described as being of smaller size than ordinary, while the upper skin or cuticle is of more than usually thin nature. The hairs of the skin are also of finer nature than in the other regions of the body; and the sebaceous or skin glands are very numerous, and possess short ducts, while their secretion is generally present in very abundant quantity.

There are three meati or compartments of the nose, which are formed in the outer wall or side of each of the nasal cavities by the turbinated bones. These compartments are of unequal size, and they communicate by apertures with certain spaces known as air-cells or sinuses, existing in the frontal, sphenoid, superior maxillary and ethmoid bones. The upper or superior meatus is the smallest compartment, and occupies the posterior part of the nasal wall. It communicates with air-cells known as the posterior ethmoidal and sphenoidal sinuses. The middle meatus is a little larger. It communicates anteriorly through a passage of infundibulum with the anterior ethmoidal and frontal sinuses. The inferior meatus is the largest cavity, and occupies the greater part of the outer nasal wall. Into the front portion of the inferior meatus the nasal duct opens; this canal conveying the tears or lacrymal secretion from the eye to the nose. (See **EYE**). Posteriorly to the extremity of the inferior meatus the aperture of the Eustachian tube, leading from the ear, may be seen.

The mucous membrane lining the nostrils and nasal cavities is also known as the pituitary membrane. It extends throughout the nasal sinuses, into the pharynx, into the nasal ducts and orbits and through the Eustachian tubes into the tympana and mastoid cells of the ear. (See **MUCOUS MEMBRANE**). In the upper part of the nose, corresponding to the upper and middle turbinated bones and the ethmoidal portion of the septum—and termed the olfactory region, from the distribution at this part of the olfactory nerves—the mucous membrane has a covering of epithelial cells of the columnar variety, but non-ciliated. And beneath this layer, and also between the columnar epithelial cells, nucleated or olfactory cells are found. These latter cells form the terminal points as it were of the delicate ultimate filaments of the olfactory nerves, or the nerves of smell (see **NOSE AND THROAT**); and in this way the odoriferous particles drawn into the nostrils, and brought in contact with these cells, stimulate

through them the olfactory nerves, and produce the sense or impression of smell.

The study of the comparative anatomy of the nasal organs shows us that man possesses a sense of smell greatly inferior in very many instances to that possessed by the lower animals. The distribution of the olfactory nerves in man is of a very limited nature when compared with what obtains in such animals as the dog, sheep, etc. And among these lower forms great differences are apparent in the kinds or qualities of odors most readily perceived or appreciated. The carnivorous mammals will in this way be most susceptible to the odors of other animals, and the herbivorous forms to those of plants.

NOSE AND THROAT, Disease of. The nasal cavities, the naso-pharynx, the pharynx and the larynx together form a continuous pathway, and so joined are known in medical literature as the upper respiratory tract, the same being a continuous passage which extends from the external orifice of the nose to the lungs. There are various subdivisions of these anatomical structures, the chief ones being in the nasal cavities and known as the accessory sinuses to be hereinafter described.

Rhinitis.—In earlier days, this affection both in its acute and chronic form was termed catarrh, and was so named by Galen who believed that the dropping down was the result of a secretion from the brain passing through the orifices of the ethmoidal bone into the nose, this process tending to relieve the brain of superfluous substances. Later on, this theory was successfully combated. Through later years, students of pathology have been able to give a more intelligent classification of the various intra-nasal inflammations in the general term rhinitis.

The two important subdivisions are (1) acute rhinitis and (2) chronic rhinitis. In a general way it should be understood that the entire upper respiratory tract is continually the seat of air-borne bacteria. This is true even of the more vicious types known as the streptococci, pneumococci, staphylococci, and often diphtheria and influenza bacilli. Furthermore, the naso-pharynx may harbor these microorganisms without producing the specific diseases which they represent, but in case the individual's resistance becomes lowered from any cause, the constitutional symptoms of these various diseases may suddenly appear.

Acute Rhinitis.—This is an acute inflammatory involvement of the nasal mucous membranes which usually extends to the mucous membrane of the upper respiratory tract. The majority of cases of this affection constitutes what is known by the laity as "cold in the head." The symptoms may also arise as a result of local irritants, or from infections like measles, scarlet fever, typhoid, diphtheria, grip, etc. The majority of cases result directly from sudden changes of temperature, insufficient clothing, damp feet and indirectly from low bodily resistance, physical exhaustion and dissipation. Contributing causes may also be mentioned such as deviation of the cartilaginous septum, stenosis, rheumatism, gout, chronic hypertrophy and unsuitable clothing; also irritant drugs, the inhalation of dust, clippings, etc. Unsanitary surroundings strongly predispose to this affection. Examples of this may be found among people who persistently remain in

a vitiated atmosphere where overcrowding, filth and defective diet prevail. These attacks are usually ushered in by sneezing, a sensation of nasal stuffiness and tickling or irritation in the throat. This is followed by chilliness, moderate rise of temperature and sufficient intra-nasal swelling to cause obstruction to breathing. A profuse watery discharge, which later becomes muco-purulent, is a characteristic symptom of this affection, and the sense of smell becomes temporarily impaired. In a small proportion of cases, the affection extends to the accessory sinuses and produces what is known as acute sinusitis. It is not the purpose of this article to prescribe treatment, but a few words upon the subject of prevention seems pertinent and here the author quotes from his textbook on 'Diseases of the Ear, Nose and Throat.'

"Frequent attacks of simple acute rhinitis, especially in adults, demand the inauguration of stringent preventive measures. The following remarks relating to the general care of the body are appropriate in their relation to taking cold. An ordinary draught of air in a room never should induce an attack of acute rhinitis in a person who habitually practises proper hygienic health measures, and one who fears such exposure confesses to a lack of resistance which is incompatible with good health. The efforts of all individuals, and especially those who abide in changeable climates, should be to fortify the resisting power of the body; in other words, to develop resistance rather than to attempt prevention by means of coddling habits, either during childhood or adult life. For this purpose, a morning application of cold water to the body, either in the form of a sponge, spray or plunge, is highly recommended. Most healthy individuals react readily and promptly from a sudden plunge into cold water, and in a considerable proportion the reaction takes place without rubbing with a towel. Nevertheless, much benefit arises from friction, induced by rubbing the entire body with a coarse bath towel immediately after the bath.

"The cold bath is contraindicated in persons who for any reason do not react after friction is applied to the surface. To those unaccustomed to its use and who desire to commence the daily morning bath, the temperature of the water for the first few days should be moderate and gradually lowered each morning until the proper temperature for quick reaction has been reached. Furthermore, the brisk rubbing benefits the capillary circulation.

"The morning use of cold water may safely be commenced in children as young as two years, and this procedure should become a part of the daily habit of all children who are free from constitutional affections. The tonic effects are most marked and the tendency to colds proportionately reduced as the body can accustom itself to the sudden application of cold water. One who can safely resist the shock of the cold plunge or even that of sponging may, with impunity and confidence, expect to resist ordinary draughts and exposure.

"Bodily resistance is also considerably influenced by the quantity and texture of clothing worn. The clothing should be judiciously selected to meet the requirements of the locality, occupation and the degree of exposure. The clothing of persons with indoor occupations should differ materially from that worn by

those with outdoor occupations. In this connection, it may be stated that excessive clothing may do as much harm as insufficient. Whenever the occupation requires indoor life, the undergarments should be of light weight, to be supplemented by heavy outer garments when going out of doors. It is not wise to wear heavyweight woolen undergarments in occupations unattended by undue exposure; the light wool will usually suffice. Of late, the linen-mesh underwear has obtained considerable popularity, upon the theory that bodily moisture rapidly passes through this fabric.

"Protection of the feet from dampness and cold is of great importance. Whenever the streets or sidewalks are wet or slushy, rubbers should be worn to protect the feet from dampness. Exposure to draughts does not induce colds in the same proportion as does the neglect to protect the feet from cold and dampness.

"The prolonged inhalation of vitiated air should also be avoided. All occupied rooms and particularly sleeping apartments should be sufficiently ventilated to insure the proper amount of oxygen. The air of a sleeping apartment should be fresh, and on account of warm bed covering, the temperature may safely be lowered to 50 degrees or even lower. In extreme weather the temperature of the sleeping apartment can be controlled by allowing sufficient heat to enter the room.

"Bodily exercise promotes resistance and thus tends to prevent colds. A brisk walk to or from business or at the lunch hour, accompanied by deep breathing, is of great benefit, although every individual, if possible, should at regular intervals indulge in more fatiguing and general muscular exercise. The gymnasium with its variety of implements for indoor exercise, bicycling, walking, hunting, horseback riding, golf and tennis for outdoor exercise are examples of healthful and helpful methods to be employed, always bearing in mind that free perspiration is of great benefit to the human economy. Even the gymnasium can be dispensed with by employing a few forms of muscular exercises in one's own home. No person may expect to maintain perfect health who refrains from systematic physical exercise.

"**General and Local Treatment.**—It is extremely difficult to induce persons suffering with acute rhinitis to submit to the form of treatment which mitigates its severity, lessens its duration and almost surely guarantees immunity from troublesome and even severe or serious complications. As a rule, the patients know that the disease is self-limited, that in a large proportion of cases serious complications do not occur, and they unwittingly run risks by attending to their usual duties, and only those who are prone to prolonged complications are willing to submit to the necessary restrictions and medication. Elderly persons should invariably remain indoors during the active stages of acute rhinitis."

Chronic Rhinitis.—Chronic rhinitis may be described as (1) a chronic inflammatory process involving the nose and possibly the accessory sinuses as a result of a succession of acute attacks. It also occurs, secondarily from systemic diseases such as syphilis, Bright's disease, gout, rheumatism, malaria, etc. 2. Membranous inflammation, of which there are three varieties: (a) croupous or pseudomem-

branous, an exudate without material organization and not due to specific bacteria, and which may be produced by escharotics or infectious fevers; (b) fibrinoplastic inflammation, which is characterized by the formation on the surface of the membrane of plastic material that seems to organize in layers, but is non-bacterial in origin; (c) diphtheritic inflammation, a more deep-seated exudate due to a specific germ, the Klebs-Löffler bacillus, or *Bacillus diphtheriae*.

Unlike the foregoing this false membrane when removed leaves a bleeding surface, showing that ulceration exists, which extends at least through the basement membrane.

3. Hemorrhagic inflammation, a violent inflammation of the mucous surface, characterized by interstitial hemorrhage.

4. Gangrenous inflammation, a type of inflammation which sometimes follows the acute infectious diseases in children. It may be due to burns, scalds, etc.

Specific Inflammations (Chronic Infectious Inflammations; Specific Granulomata).—

These include actinomycosis, glanders, leprosy, syphilis, tuberculosis (q.v.), and rhinoscleroma, which is characterized by excessive thickening and swelling of the skin and mucous membrane of the nose, and is supposed to be due to *Bacillus rhinoscleromatis*.

Nasal Bacteria.—Owing to the peculiar construction and functions of the nasal cavities, together with the moist condition of the membrane, bacteria to a great or less extent accumulate. The secretions of the nose and nasopharynx are supposed by most bacteriologists to possess considerable germicidal influence, as may be instanced by the fact that they are found in much larger numbers in the anterior nares than in the rhinopharynx. It may also be noted that even the more virulent types, especially the *Staphylococcus pyogenes*, *Micrococcus pneumoniae* (Frankel), *Bacillus tuberculosis*, Friedlander's pneumococcus, Klebs-Löffler bacillus (diphtheritic), and the streptococcus may be found and still not result in the development of the specific diseases of which they are supposed to be the causative factors.

It is difficult to disassociate this condition from that of chronic purulent nasal sinusitis. Indeed, in almost every case of chronic rhinitis, a purulent discharge from some of the accessory sinuses is present. In a limited proportion of cases, atrophy of the nasal mucosa is a prominent symptom and often the turbinated bones become more or less absorbed, while in the majority of cases hyperplasia or infiltration of the nasal mucosa is the prominent symptom, invariably resulting in more or less nasal obstruction. Defects in nasal conformation such as septal spurs and deflections which interfere with nasal drainage and respiration are common etiological factors. When long continued, it results secondarily in marked changes in the mucous membrane of the post-nasal and pharyngeal spaces. Accumulation of secretions induces sneezing, hawking and clearing of the throat.

Atrophic Rhinitis.—This affection may be described as a chronic inflammatory process involving the intra-nasal tissues whereby more or less absorption of the turbinal bones and destruction of the glandular structures of the mucosa is present. In the majority of cases the condition is a simple chronic catarrhal process

but the more serious ones are hereinafter described under the heading of *Ozena*. The simple form may not be attended by distinctive symptoms even though the secretions are altered. While the actual cause is not fully known, it is generally considered to result from frequent and long continued attacks of acute inflammation of the nasal mucosa. Most observers incline to the opinion that all cases of atrophy have been preceded by long continued hypertrophy of the same tissues. A marked symptom is alteration in the character of the secretion which is prone to accumulate and end in crust formations. Dryness of the pharynx and larynx is a later symptom, probably resulting from the loss of normal moisture imparted to the air in its course through the nasal cavities. Any local treatment should be antedated by careful physical examination and the discovery, if possible, of any constitutional disease or hereditary tendency like syphilis or tuberculosis. Frequent cleansing of the nasal mucosa with bland alkaline solution is helpful.

Ozena.—The term means fetid accumulation in the nose. This marks the most troublesome of all nasal affections especially from the standpoint of the patient whose intra-nasal spaces are continuously packed with highly offensive crusts and masses of secretion. Atrophy of the intra-nasal tissues is invariably present. A recent discovery has shown that almost without exception the antrum of Highmore is the seat of the disease and that by appropriate operation upon this cavity the disease may be eliminated. In any event, a long continued local treatment preferably by a rhinologist is imperative.

Nasal hydrops is an obstructive nasal condition accompanied by an excessive flow of watery fluid from the nose, probably of reflex origin.

Nasal Syphilis.—A disease also called specific catarrh, specific rhinitis and syphilitic rhinitis. It is an intra-nasal manifestation of syphilis, usually of the tertiary variety, accompanied with more or less necrosis of both soft tissues and bone. Occasionally the nasal mucous membrane may become the seat of the initial lesion. The intra-nasal lesions of the tertiary stage are severe and extensive and may involve the cartilaginous septum or the bony framework of the nose, resulting often in serious and extensive deformity. Wherever there are masses of necrosed bone the odor is exceedingly offensive, and frequently large pieces of broken down bone may be removed *en masse*.

Lupus (q.v.) is a skin-disease of which there are two distinct forms.

Furunculosis (phlegmonous rhinitis) is the formation of abscess in any part of the nasal cavities.

Ulcers.—Small ulcers may form in various portions of the nasal cavity, but are usually found upon the septum, and result from foreign bodies, picking of the nose, and from a general systemic disturbance like diabetes. Malignant growths occur in the nose and do not differ essentially from those found elsewhere in the body. Infected ulcers, when occurring in nasal cavities, are due to some specific form of disease like syphilis, glanders, diphtheria, scarle fever, smallpox, typhoid fever, or typhus fever, the type depending upon the nature of the accompanying disease.

Neurosis.—Neurosis of olfaction (smell) is a perversion of olfaction, a perception of imaginary odors frequently amounting to hallucination. Hyperosmia, overacuteness of olfaction, is supposed to be due to impairment of nerve-force. See *ANOSMIA*.

Sneezing is a forcible and audible spasmodic expulsion of air through the nose and mouth caused by inhalation of irritating substances or by irritation of the vasomotor centres. See *HAY FEVER*.

Non-Inflammatory Diseases.—Of these, one of the most common is nosebleed (q.v.). Several varieties of foreign bodies are occasionally found in the anterior nasal space. Rhinoliths are developments of hard substances in the nasal mucosa formed from the deposit of mineral salts. Various animate foreign bodies may be found in the nose, such as insects, maggots and intestinal worms. Of other foreign bodies, those placed in the nostrils by malingerers and children form the greater part, and consist chiefly of buttons, beans, peas, seeds, rags, etc.

Neoplasm of the Upper Respiratory Tract.—Non-malignant neoplasm (papilloma) is a benign wart-like growth made up of hypertrophied papillæ, appearing rarely in nasal cavities, but occasionally seen in the pharynx and larynx. Adenoma is a benign tumor made up of connective tissue enclosing large spaces filled with blood. Enchondroma in the nasal passages is a cartilaginous growth, sometimes called chondroma, and is an offshoot from the cartilaginous septum. Exostosis is a bony growth projecting outward from the surface of the intra-nasal bony framework. Myxoma (nasal polypus) is the lowest grade of adult connective-tissue tumor. It is a soft translucent growth made up of connective tissue and capillary vessels enclosed in a jelly-like matrix. They are usually pedunculated, multiple and sometimes of large size, grayish in color, translucent, and have a smooth surface. They give rise to symptoms of intra-nasal pressure and obstruction, asthma, laryngeal cough, impairment of smell, and excessive watery discharge. As a rule the growth is associated with diseases of the accessory sinuses.

Malignant Tumors.—Carcinoma and Sarcoma may originate in any part of the upper respiratory tract. It rapidly assumes grave proportions, and is amenable to operative interference only during incipency. Sarcoma, which is a highly malignant tumor, has its origin in the deep connective tissue and gradually spreads to the mucous surface. It is nodulated and fungoid in appearance and tends to ulcerate in the later stages. See *TUMOR*.

Diseases and Deformities of the Anterior Nasal Cavities.—Owing to the prominence of the nose and its peculiar anatomical conformation, the septum becomes peculiarly liable to injuries and malformations, the most common of which is deviation or deflection. A deviated or deflected septum (usually limited to the cartilaginous portion) is a permanent change from the perpendicular to varying deformities. The deformities assume various shapes, with an occasional offshoot of a cartilaginous mass heretofore described as enchondroma. These often result in severe intra-nasal obstruction and require radical operative interference for relief. A modern operation for septal deformities has

proved most effective. Synechia is a cartilaginous or fibrinous band extending from the septum to the nasal wall. A synechia may sometimes form between the turbinals. Septal ulcerations are usually due to picking the nose, the desire for which may be induced by irritants, foreign bodies and the inhaling of poisonous gases. They may also be syphilitic in origin. Septal perforations are openings through the cartilaginous septum. They are of varying sizes, and are due to extension of ulceration. Abscess of the septum is a collection of pus in the septal tissues, due to injuries or general systemic diseases. Depression of the nasal cartilage is a nasal deformity following extensive loss of septal tissue or of nasal bones, usually due to syphilis or injury.

Diseases of the Nasal Accessory Sinuses.

—The nasal accessory sinuses are a series of cavities and cells all lined with mucous membrane and having communication with the nasal cavities. They are the frontal sinuses, the anterior and posterior ethmoidal cells, the sphenoidal sinuses and the maxillary antra.

Maxillary Sinuses.—The maxillary sinus or antrum of Highmore is situated in the body of the superior-maxillary bone. It is separated from the nasal cavities by the outer nasal wall with the exception of a small opening whereby it communicates with the nasal cavities. It is lined with an extremely delicate mucous membrane and frequently becomes the seat of infection by way of the nasal cavities. In fact, all of the nasal accessory sinuses are liable to become the seat of acute purulent inflammatory processes, especially the infection accompanying attacks of grip. Exanthemata also may be mentioned as causative factors. Occasionally, the maxillary sinus becomes infected through the roots of carious teeth. The attacks are accompanied by a sensation of fullness, severe localized pain and purulent discharge. Barring the clinical symptoms, diagnosis is facilitated by transillumination, which is effected by first placing the patient in a totally dark room and then introducing into the mouth a bright electric light. A comparison of the illumination with the opposite side often furnishes important diagnostic information. A more thorough method is by means of a radiograph. A good radiograph of the nasal accessory sinuses is most valuable in aiding the rhinologist to locate diseased areas. Acute cases usually recover by local treatment, but chronic cases may require operative measures. The antrum also may become the seat of both benign and malignant growths.

Diseases of the Ethmoidal Cells.—These groups of cells, located in the ethmoid bone and communicating with the nasal cavities, are subject to both acute and chronic inflammatory and purulent diseases, the most common being the acute catarrhal inflammation occurring with general purulent rhinitis. The purulent form may occur on one or both sides, and may be associated with a suppurative condition of other accessory sinuses. When far advanced, it results in an enlargement of the middle turbinated bones, the walls of which become cystic, forming, with the broken-down tissues of the ethmoid, large cysts filled with pus or polypoid degeneration.

The sphenoidal sinuses are less frequently the seat of disease, although they may be the

seat of the same diseases heretofore described as occurring in the other sinuses.

The anatomical relation of the frontal sinuses to the nasal cavities renders them liable to the development of both acute and chronic inflammatory conditions, purulent infections and tumors.

Catarrhal inflammation, both acute and chronic, with its attendant supra-orbital pain and sense of weight and fulness in the forehead, is occasionally present in connection with the same condition in the nasal cavities. Acute suppurative inflammation (empyema) is an acute suppuration brought about by the introduction of infection from the nose through the infundibulum. When long continued, the purulent process takes on the form of chronic purulent inflammation, in which there may be more or less necrosis of the bony walls and the development of polypoid degeneration. The severest forms are usually quite curable by means of operation.

Nasopharynx.—The nasopharynx is that section of the upper respiratory tract between the posterior border of the vomer and the level of the soft palate. The nasopharynx may be the seat of the following diseases: (1) acute nasopharyngitis (acute post-nasal catarrh, acute rhinopharyngitis); (2) chronic nasopharyngitis; (3) atrophic pharyngitis (see *Atrophic Rhinitis* above); (4) hyperplastic nasopharyngitis; (5) specific inflammations (see *Pharynx* below, also PHARYNX, a separate article); (6) adenoid vegetations (see *Tonsils* below).

Acute nasopharyngitis is an acute inflammation of the mucous membrane lining the nasopharynx, usually accompanied by similar inflammations in the nose, pharynx and larynx. Chronic nasopharyngitis is a chronic catarrhal inflammation resulting usually from repeated acute attacks and with the same causal relations. It is characterized by the presence of tenacious mucus, with more or less continuous efforts on the part of the victim to "hawk" and clear the throat. In the later stages the secretion shows a tendency to become thick, forming scabs and inspissated masses. This affection may result from the inflammation of irritating gases. Hyperplastic nasopharyngitis is a chronic inflammation resulting in the development of connective tissue in the mucous membrane.

Adenoids.—The lymphatic glands which bear the name of adenoids are a series of lymph-glands which are superficially located in the mucosa of the vault and posterior wall of the naso-pharynx. These lymph-glands are normal under healthful conditions and require treatment only when they become the seat of hyper-plastic enlargement. It is an affection essentially of child life and it is more commonly observed between the ages of 3 and 12 years. Heredity seems to be an important etiological factor. Bad hygiene, vitiated air and irritating gases are supposed to be among the predisposing causes. The presence of this condition is indicated by interference with nasal respiration, resulting in mouth-breathing, especially at night, snoring, restlessness, "dead" voice, and often with considerable arrest in the progress of physical development. With these symptoms are frequently found narrowing of the nasal orifices, attacks of middle-ear suppuration and narrowing of the chest-walls. En-

largement of these glands is considered to be extremely detrimental to child-life, and complete removal by operation offers the only means of cure and should always be done.

Pharynx.—The pharynx is that portion of the upper respiratory tract bounded above by the soft palate and below by the upper borders of the larynx and œsophagus. The uvula, when normal, should be about three-eighths of an inch long. It is occasionally bifid, and when it is greatly relaxed or enlarged the condition is described as elongation of the uvula. The uvula may be subject to inflammations, ulceration, tuberculosis, syphilis and œdema. The same may be said of the soft palate, which is also subject to adhesions, in which there is an attachment or adhesion between the soft palate and the posterior wall of the pharynx. Adhesions of this character are due to the ravages of syphilis.

Tonsils.—The tonsils are a series of glands known as (1) the pharyngeal or Luschka's tonsil, also called adenoid vegetation; (2) the faucial tonsils, located on either side of the pharynx between the faucial pillars; (3) the lingual tonsils, a series of glands at the base of the tongue. Taken as a whole, they have been known as Waldeyer's ring. A visible hypertrophy or enlargement of any one of the series is usually accompanied by similar enlargement of the others. They form a part of the normal anatomical structures of the locality and, when diseased, call for operative interference.

The faucial tonsils are located between the anterior and posterior faucial pillars and normally are not visible to the eye. The lymphatic structure, however, is liable to pathological changes resulting in enlargement or hypertrophy. The enlargement may be slight, but the tonsils may become so much enlarged that they meet in the median line of the pharynx. The enlargement becomes much aggravated during the attacks of the various acute inflammations which may occur in this region. The faucial tonsils are subject to acute inflammation occurring with general pharyngitis.

Tonsilar and peritonsilar abscess (quinsy, phlegmonous tonsilitis) is a suppurative inflammation of the tonsil, accompanied by severe pain, fever and swelling in the tonsilar or peritonsilar region, resulting in formation of abscess.

Follicular tonsilitis (lacunar and cryptic tonsilitis) is an acute inflammation of the tonsil attended with small fibrinous exudates in the crypts. It is accompanied by constant pain, chills, high temperature and is supposed to be due to exposure to cold, climatic changes and lowered vitality.

The causes of hypertrophied tonsils are chronic inflammation, inherited diathesis, gouty or rheumatic conditions, climatic influences, and the infectious diseases of childhood. The condition is accompanied by interference with respiration, more or less difficulty in swallowing, involvement of the Eustachian tube, anæmia, languor and retarded physical development, all these symptoms being aggravated by the recumbent position.

More recent investigation of diseased tonsils in adult life have shown that even when these organs are not particularly enlarged, they may be the seat of chronic infective processes, particularly chronic peritonsilar abscess.

Caseous tonsilitis is a condition resulting from acute or chronic inflammation of the tonsils, in which the crypts show a tendency to fill up with various secretions. These masses show a tendency to ferment and form small foul-smelling caseous masses, which eventually squeeze out of the crypts. It has been found that muscular rheumatism and even attacks of pericarditis and appendicitis may originate from the tonsil. Modern removal of this organ is known as tonsilectomy, an operation which is usually performed under general anæsthesia. This operation means the complete removal of the organ with its sac thus opening up any blind abscesses which may lie underneath. Various methods are employed in the performance of this operation.

Mycosis of the tonsil and pharynx is an affection characterized by the development of small yellowish-white, clearly defined masses forming around the tonsilar crypts and frequently extending over the surface of the pharynx and the glands at the base of the tongue. It is supposed to be caused by *Leptothrix buccalis*.

Fish-bones, pins and other foreign bodies occasionally find lodgment in the tonsil-crypts.

Lingual tonsil is made up of a mass of adenoid tissue located between the circumvallate papillæ at the base of the tongue and the attachment of the epiglottis.

Disease of the Pharynx (acute inflammatory diseases of the pharynx, acute catarrhal pharyngitis), an inflammatory process, catarrhal in character, results from exposure to cold, and is usually attended with a like condition in the nose and larynx. It may also be due to gastric disorders and lowered vitality. There are many contributing causes, among which may be mentioned the exanthemata, bad ventilation, bad hygiene, insufficient clothing, overindulgence in alcohol and tobacco, and the inhaling of noxious gases. The disease is indicated by a certain dry painful condition of the pharyngeal walls, congested vessels, swelling and sometimes œdema. Later on the dryness gives way to a more or less profuse secretion gradually becoming more tenacious and mucopurulent.

Infective pharyngitis (hospital sore throat, phlegmonous pharyngitis) is an inflammatory condition, attended with more or less exudate, occurring in individuals who are exposed for a prolonged period to septic influences. It is frequently found in the throats of physicians and nurses who care for diphtheria and scarlet-fever patients.

Croupous or simple membranous pharyngitis is an inflammation of the pharynx or tonsils attended with the development of a false membrane without the presence of any specific germ. Clinically the disease resembles diphtheria, but is in no sense to be considered as the same. (See DIPHTHERIA). A positive diagnosis can be established only by bacteriological examination.

Ludwig's Angina.—This is a suppurative cellulitis occurring in the tissues of the neck, due to secondary infection from within the throat. Diphtheria, scarlet fever and grip may be mentioned as exciting causes.

Chronic Inflammatory Diseases.—Simple chronic pharyngitis (clergyman's sore throat) is an inflammation of the pharynx resulting either from frequent acute inflammations or

from overuse of the voice. Public speakers and singers are peculiarly liable to its development. It may also result from lesions of the liver, kidneys, lungs and heart, or from the use of stimulants. The marked symptoms are hyperæmia or congestion, with dryness, hoarseness and a feeling of throat-tire.

Follicular pharyngitis (granular pharyngitis) may be defined as an inflammation in which the granular structures of the pharynx become chiefly involved. It is accompanied by hoarseness, irritation and cough, together with the appearance on the posterior wall of small granular enlargements. The disease is supposed to result either from voice-strain or improper vocalization.

Atrophic pharyngitis (dry pharyngitis, pharyngitis sicca, atrophic pharyngitis) may be defined as a chronic inflammation resulting in pathological alterations in the structure of the mucous membrane of the pharynx and impairment of the muciparous glands. The disease is attended therefore by perverted secretion, with a burning, itching sensation in the throat, and extreme dryness. It is usually accompanied by atrophy of all the membranes of the upper respiratory tract.

Rheumatic pharyngitis (gouty sore throat, rheumatic sore throat) is an affection that may be acute or chronic, and is due to the presence of some irritant in the blood. The uric-acid diathesis may be considered an exciting cause, and the disease responds to antirheumatic or antigout treatment.

Tuberculosis of the pharynx is a rare involvement, always secondary to pulmonary tuberculosis. Its presence is indicated by the formation of small tubercles upon the soft palate or pillars of the fauces. A positive diagnosis may be made by microscopical examination of the secretions.

Syphilis.—All three forms of syphilitic lesions may appear in the pharynx. The primary lesions are occasionally found upon the tonsils or other surfaces of the pharynx in the form of chancre. The mucus-patch is usually present at some period during the history of every case. The tertiary lesion or gumma may also develop in any of the pharyngeal structures, often resulting in extensive ulceration and adhesion.

Glanders.—An infectious disease due to the *Bacillus mallei*, and communicated to man from animals, usually horses.

Retropharyngeal Abscess.—A suppurative inflammation in the posterior wall of the pharynx resulting in the development of abscess, which may burrow upward or downward, causing serious danger to life. The primary infection is usually due to inherited tuberculosis or syphilis.

Foreign Bodies in the Pharynx.—The exposed location of the pharynx, with its irregular surfaces, renders it peculiarly liable to the lodgment of foreign bodies. Among those rather frequently observed are fish-bones, pieces of other bone, shells, coins, pins, needles, sharp objects of various kinds, false teeth, etc.

The Larynx.—That section of the upper respiratory tract which occupies the space between the root of the tongue and the upper end of the trachea is called the larynx (q. v.). It is subject to a variety of diseases, among which

are malformations and deformities. Congenital deformities in the larynx are rare. Congenital stenosis is a narrowing of the calibre of the larynx due to the formation of webs or bands stretching across the interior. Acquired stenosis is due to cicatricial contraction, traumatism, or syphilis. Tubercular ulceration may also be mentioned as a cause of stenosis of the larynx.

Acute catarrhal laryngitis (spurious croup) is an acute inflammatory process involving the mucous membrane of the larynx and attended with hoarseness, dryness and slight dyspnoea. The disease is caused by cold, exposure, gastrointestinal disturbances, nasal obstruction, bad ventilation, inhalation of irritating gases and overuse of the voice. There is usually slight fever, cough and in the later stages considerable expectoration.

Acute laryngitis in children (spasmodic croup, false croup) does not differ in etiology and pathology from ordinary acute laryngitis. The symptoms, however, are much more marked. The small calibre of the larynx in childhood, together with the greater elasticity of the tissues, renders the condition more serious. The engorgement is more rapid, and the symptoms of suffocation rapidly develop. The peculiar stridulous breathing, with frantic respiratory efforts and a hoarse barking cough, gives the disease an appearance of unusual severity. The disease usually continues for three days, and is relieved by steam-inhalations, emetics, and laxatives.

For spasm of the glottis see LARYNGISMUS STRIDULUS.

Acute epiglottitis, inflammation of the epiglottis, is rarely entirely local except when due to swallowing an irritating substance. It is usually associated with inflammation of contiguous membranes. The chief symptom is a burning, smarting sensation, with a tendency to oedema.

Oedema of the larynx is an acute inflammation of the larynx accompanied by serious infiltration of the tissues, and resulting in marked interference with respiration.

Rheumatic laryngitis (laryngeal rheumatism, gouty sore throat) is an acute laryngitis directly traceable to a rheumatic or gouty diathesis.

Membranous laryngitis (true croup, membranous croup, diphtheritic croup, fibrinous croup, croupous laryngitis, laryngeal diphtheria) is an inflammation of the mucous membrane lining the larynx, manifesting the appearance of true diphtheria, but usually without the presence of Klebs-Löffler bacilli. Various forms of pathogenic bacteria are usually present. It may occur at any season of the year, and clinically it approaches so nearly to diphtheria that a positive diagnosis is most difficult. Many observers believe the condition to be exceedingly rare, and that true diphtheria is nearly always present wherever true membrane is found in the larynx.

Laryngeal diphtheria, without the presence of membrane in the pharynx or nose, sometimes occurs, the symptoms being quite similar to membranous laryngitis. The characteristic odor, however, is usually present, and the Klebs-Löffler bacilli may be found.

Hemorrhagic laryngitis may occur as a re-

sult of acute laryngitis, or from syphilis, tuberculous or malignant disease, or from rupture of a blood-vessel.

Simple chronic laryngitis (chronic catarrh of the larynx) is an inflammation involving both the superficial and deeper layers of the mucous membrane, with more or less of tissue-changes. The disease is supposed to result from repeated acute attacks. A subacute variety may be mentioned, but it cannot be clearly defined beyond stating that it is the commencement of the chronic form. Among other causes are the inhalation of irritating gases or dust, nasal obstruction and improper use of the voice. The marked symptoms of this condition are hoarseness, a tickling sensation, with a tendency to clear the voice, slight cough, with considerable secretion and occasional loss of voice.

Dry laryngitis (laryngitis sicca, atrophic laryngitis, laryngeal ozæna) is always associated with a similar condition in the nose and nasopharynx, the symptoms of which have all been described.

Anæmia of the larynx, when marked, is usually a local manifestation of general anæmia.

Singers' nodules (chorditis tuberosa, trachoma of the vocal chords) are new-growth formations appearing on the margin of the vocal chords and usually at the junction of the middle and anterior thirds. They are small oval masses, sometimes developing upon both chords. While resulting from inflammation, the exciting cause is no doubt the improper use of the vocal apparatus. There is marked interference with phonation and sometimes complete loss of voice. Treatment consists either of rest or the adoption of a system of vocal exercises which bring other series of muscles into activity. Local astringent applications have been employed.

Syphilis of the Larynx.—Both secondary and tertiary lesions of syphilis may appear in the larynx, mucous patches, however, being somewhat rare. The tertiary stage is of comparative frequency, and is manifested by the development of gummata, with destructive ulceration and subsequent cicatrization.

Tuberculosis of the Larynx.—This disease, also called consumption of the larynx, consumption of the throat, laryngeal phthisis and tubercular laryngitis, is a specific inflammation of the larynx, the direct result of the tubercle bacillus. Tuberculosis of the larynx is rarely, if ever, a primary affection, and usually occurs as a manifestation of general tuberculosis. It begins with the development of minute miliary tubercles in the larynx, which eventually result in large swellings of the arytenoid cartilages. These subsequently break down, forming large ulcerations. Great suffering results, with dysphonia, dysphagia, continuous irritation of the larynx, progressive hoarseness and irritating cough with excessive expectoration. In the late stages hemorrhage may occur. This form of tuberculosis is rapidly fatal, with but little hope of the patient's recovery.

Foreign Bodies in the Larynx.—Accidental entrance of foreign bodies into the larynx occasionally occurs. Foreign bodies usually enter during the process of swallowing, speaking or breathing. The resulting danger depends much upon the character and size of the foreign body and also upon its location.

Liquid food and even small portions of solid food are usually dislodged with little difficulty unless the entire calibre of the larynx is shut off. Foreign bodies may usually be seen by the ordinary methods resorted to for examining the interior of the larynx. They are removed by extraction by way of the mouth and larynx or by external operation. Unfortunately the masses are sometimes drawn beyond the larynx into the bronchial tubes with fatal results, unless they are removed by bronchoscopy.

Neuroses of the Larynx.—Of the various laryngeal symptoms sometimes resulting from impaired nerve-supply or from brain-lesions is spasmodic cough. This occurs more frequently in persons of neurotic type, although it may be of reflex origin. Anæsthesia, paræsthesia and hyperæsthesia of the larynx may be mentioned under this type of affections.

Hysterical aphonia is usually described as a sudden and complete loss of voice, occurring in unmarried females. The immediate existing cause is usually shock, fright, anger or some other sudden emotion. The condition may remain for some time and recovery may be sudden and unexpected and without treatment.

Laryngeal Vertigo.—This is a neurosis in which the dominant symptoms are a sudden strangling cough with vertigo and momentary loss of consciousness. It is a rare affection, and is usually associated with acute or chronic inflammation of the larynx, strongly influenced by fatigue or nervous excitement. The disease quickly responds to treatment.

Paralysis of the Vocal Chords.—Temporary interference with the nerve-supply of the various muscles controlling the larynx, especially from local causes, is not infrequent. The paralysis following diphtheria and accidental poisoning is typical. A more severe form results from pressure from aneurism, cancer, phthisis and syphilis. But lesions of the brain are by far the most destructive in results. Paralysis in this location may be either motor or sensory. Bilateral paralysis of the superior laryngeal nerve is both motor and sensory in character. The gravity of these conditions depends upon the cause. Bilateral abductor paralysis, on account of the approximations of the vocal chords without the muscular power to separate them for proper inhalation, is dangerous to life, inasmuch as a fatal attack of dyspnœa may occur at any time.

Bronchoscopy.—This is an operation devised to remove foreign bodies from the bronchial tube and larynx. Metal tubes of various sizes are employed for this purpose. These are of various sizes and are illuminated by specially devised electric lamps.

Intubation of the Larynx.—This process was devised and perfected by the American physician, Joseph O'Dwyer. It consists in placing a hollow tube within the larynx for the purpose of relieving dyspnœa. Intralaryngeal tumors sometimes tend to occlude the lumen of the larynx and intubation is resorted to for the relief of the attendant dyspnœa. Intubation also serves as a method of relief in cases of laryngeal stricture. The operation is never attempted unless the patient's life is threatened by occlusion of the larynx or sudden spasm. The most common disease giving rise to the necessity for intubation is diphtheritic laryngitis.

Suspension Laryngoscopy.—Suspension laryngoscopy is a procedure by means of which the curved road from the teeth to the vocal chords can be converted into a straight one so that through the wide open mouth a direct view of the larynx can be obtained, so that the operator is left with both hands free for manipulation and operative work. This procedure is carried out by means of an elaborate mechanical outfit and is not applicable to ordinary office work.

Tracheotomy.—An operation whereby an external opening is made into the trachea below the larynx, through which a tube known as the tracheotomy-tube is inserted. It is performed for the relief of any obstruction to breathing. The site selected for entrance into the trachea may be high or low according to the nature and location of the obstruction.

Operations on the Larynx.—Thyrotomy consists of splitting the thyroid cartilage in the median line for the purpose of opening the larynx and removing growths or foreign bodies. Laryngectomy is an operation for the complete removal of the larynx and is performed only in case of malignant growth. In cases where only part of the larynx is removed it is called partial laryngectomy. An artificial larynx is an instrument which in certain cases may be introduced after a laryngectomy and which serves to fulfil some of the functions of the larynx.

Consult Phillips, 'Diseases of the Ear, Nose and Throat'; Wright and Smith, 'Diseases of the Nose and Throat.'

WENDELL C. PHILLIPS,
Surgeon to the Manhattan Eye, Ear and Throat Hospital.

NOSEBLEED, hemorrhage from the nose; epistaxis. This is the most frequent form of bleeding from a mucous membrane. It may be caused by direct injury, as by a blow upon the nose, a scratch within the nostril, etc., or may result from ulceration or other morbid growth in the nasal cavity. It is also of frequent occurrence in gunners, caused by the severe concussion of heavy firing. It is most common in children and young adults. When an active hemorrhage, it may be preceded by a feeling of tension and heat in the nostrils, pain in the forehead, giddiness, buzzing in the ears, flushing of the face. These symptoms are seldom all present in the same case, and in many instances the flow of blood is not preceded by any apparent disorder. Nosebleed may also be of a passive character, as when due to a morbid state of the blood, for example, in typhoid fever, scarlet fever, purpura, scurvy, etc., or to obstruction of the circulation by disease of the heart and liver. In persons advanced in life it must be more cautiously interfered with than in the young. If the person so affected is plethoric, the hemorrhage is evidently of an active character, and is a natural relief. Usually it will stop by the clotting of the blood in the nostrils or upon pressure of the wing of the nostril against the nasal septum. It may, however, go to an extreme extent and require other means for checking. There are many methods of affecting this, but the application of cold water, snow, ice, etc., to the forehead, spine or other parts of the body is the most general. Raising both arms suddenly above the head has been said to stop the flow quickly; or

a small quantity of solution of alum, as strong as it can be made, may be thrown up with a syringe or a piece of linen soaked in the solution may be stuffed up the nostrils. From 10 to 15 drops of dilute sulphuric acid may be given in water at intervals, according to the nature and persistence of the attack. The application of cotton or a sponge, tannin, alum, etc., may be necessary under direction of a physician, who, in desperate cases, is needed for discovering the bleeding-point, and by whom plugging of the nostrils may be resorted to. Recently anti-pyrin has been used with very great success. It is dissolved in water, about 10 grains to the ounce. Another efficacious remedy is the extract of suprarenal glands used in strong solution. With both these remedies cold water is used to free the bleeding cavity of clots; when this has been effected about half an ounce of one of these solutions is insufflated and retained in the nose as long as possible. Consult 'Reference Handbook of the Medical Sciences' (Vol. IV, pp. 68-70, New York 1914).

NOSKOWSKI, nōs-kōf'skē, **Sigismund**, Polish composer: b. Warsaw, 1846; d. Wiesbaden, Germany, 1909. After studying at the Warsaw Musical Institute in 1864-67 he went to Berlin to study under Kiel and Oscar Raif. In 1876 he became conductor of the Bodau Society in Constance. In 1881 he returned to Warsaw as director of the Musical Society. He became professor in the Warsaw Conservatory in 1888, second kapellmeister of the Warsaw Philharmonic in 1904, and of the Warsaw opera in 1906. His opera, 'Livia,' was brought out in Lemburg in 1898. He also wrote symphonies, ballet-music, an overture, string-quartets and piano music. Noskowski also invented a musical notation for the blind.

NOSOLOGY, in medicine, that science which treats of the systematic arrangement or classification and nomenclature of diseases. Many systems of nosology have been in use at different times, some of which have been founded on the nature of the ascertained cause of disease; others on the pathological conditions which attend diseases; and still others on the differences between structural and functional diseases and so on. In fact different systems will always be required for different uses. Recent progress in bacteriology has necessitated modifications in nosological methods, and future advancements will do the same, while the methods of modern medicine lead to such classifications as best suit the requirements of scientific knowledge applied in ordinary practice. See DISEASE—CLASSIFICATION OF DISEASES.

NOSSAIRIANS, nōs-sā'ri-anz (Arabic for Nazaræans), a subdivision of the Shiites, or followers of Ali, who hold that God has incorporated himself with some of their prophets, particularly with Ali, and Mohammed ben-Hanisiah, his son. The Nossairians are charged with borrowing this doctrine from the Christians who teach the incarnation of God in Christ, hence they nickname them Nazaræans. Consult Broughton, 'History of Religions.' See MOHAMMEDANISM.

NOISSI-BÉ, nōs-sē-bā', a volcanic island off the northwest coast of Madagascar, about 14 miles long and eight miles wide; area 130

square miles. In 1840 it was ceded to France by Madagascar, and when Madagascar became a possession of France, in 1896, Nossi-Bé became a part of the territory under the governor-general of Madagascar. Portions of the island are very fertile; sugar cane, coffee and tobacco are among its products, and there are distilleries and sugar factories. Hellville, the chief city, is a port of call visited annually by a large number of ships. Pop. 11,225. See MADAGASCAR.

NOSTALGIA (Greek, "homesickness"), a feeling of depression and anxiety due to absence from home or country. The victim of this disease is possessed with the desire to return, and often filled with apprehension and despair when the desire is without early prospect of being gratified. The condition is apt to be attended by loss of sleep, loss of appetite, often by emaciation and various forms of physical malady, while the psychic disturbance sometimes leads to melancholia ending in mania and death. Nostalgia is especially liable to occur in cases of unwilling absence from home, as those of conscripts, etc. Even soldiers voluntarily serving far from home are often great sufferers from this disease, insomuch that army medical officers have come to recognize it in its extreme severity as a disability warranting furlough, or even discharge, in order to save the patient's life. This aspect of nostalgia was impressively illustrated in the United States army both in the Philippines and in Europe.

NOSTRADAMUS, nōs-trā-dā'mūs (true name MICHEL DE NOTREDAME), French physician and astrologer: b. Saint Remy, Provence, 14 Dec. 1503; d. Salon, 2 July 1566. He was of Jewish descent, studied first at Avignon, and then at the medical school of Montpellier, and after taking his degree acted for some time as a professor, but afterward settled as a medical practitioner at Agen. Finally, after traveling in Italy, he established himself at Salon, near Aix, about 1544, where he wrote his famous 'Prophéties' (Centuries) or astrological predictions written in rhymed quatrains. They obtained great success. Catherine de' Medici invited him to court to cast the horoscope of her sons, and the apparent fulfilment of his predictions led, on the accession of Charles IX, to his appointment as royal physician. In 1550 he published an almanac containing weather predictions. Consult Baresté, 'Nostradamus' (1842).

NOSTRILS. See NOSE AND THROAT; NOSE-BLEED.

NOSTRUM, a derogatory term for quack remedies and medicines and for certain patented remedies which have proved worthless or injurious.

NOTA, nō-tā, Alberto, Italian dramatic poet: b. Turin, 15 Nov. 1775; d. there, 18 April 1847. He was carefully educated, and after studying law practised for a long time as an advocate and held important appointments under government until the political circumstances of Italy obliged him to retire from public life. The comic element is weak in him, the plot usually very simple and the events taken from ordinary life. On the other hand he excels particularly in his delineations of character and most irregular natures are presented with extraordinary skill. Of his numerous dramas 'La

Fiera' (1826), a graphic and amusing description of manners, is perhaps the best. Among others may be named 'Il Filosofo celibe' (1811); 'La novella sposa' (1826); 'Il Torquato Tasso' (1826). Twelve editions of his works appeared between 1816 and 1843, the last Italian edition, 'Comedie di Alberto Nota' (8 vols.), appearing in 1842-43.

NOTABLES, Assembly of, in French history, signifies the deputies of the states who were appointed and convoked by the king. It had no legislative or executive powers, and did not, like the states-general (q.v.) set up constitutional claims. In the early history of France mention is several times made of the notables, but the first assembly of any importance was in 1554. From 1626 no such assembly was again called, till in 1786 the minister and comptroller-general, Calonne, conceived the idea of summoning the notables for the purpose of effecting several arrangements which he considered necessary, and there were accordingly assembled 7 princes of the blood, 9 dukes and peers, 8 field-marsals, 22 noblemen, 8 counsellors of state, 4 masters of requests, 11 archbishops, 37 chief justices, 12 deputies, the civil lieutenant and 25 magistrates of the different cities of the kingdom, making in all 144 persons. This assembly forms an epoch in the modern history of France. A second meeting of the notables was called in November 1788 to consult on the manner of assembling the states-general and was dismissed on 12 December.

NOTARY, or NOTARY PUBLIC (Latin *notarius*, from *nota*, mark), originally denoted, with the Romans, those slaves or freedmen who acted as stenographers (making use of certain abbreviations, signs, *notæ*), particularly in the meetings of the senate. In later times the *notarii* were the secretaries of public authorities. From the Romans the name passed over to the nations of Western Europe, and in modern times a notary is a witness, appointed as such by government, whose testimony is in some cases useful to give credibility to instruments; in other cases is required by law to give them full validity, as, for instance, in protests of bills of exchange, etc. In France the importance of the notary was, and still is, greater than anywhere else. He is not only a public witness for every one who wishes his testimony, but he is also the great witness of government. He makes all contracts, mortgages and other deeds and conveyances where the property in question amounts to more than 150 francs.

In Great Britain and the United States a notary public is a person who publicly attests deeds or writings to make them authentic in another country, but he principally acts in business relating to commerce, makes protests of bills of exchange which are not accepted or not paid; attests the statements of masters of ships in regard to the damage which their vessels have suffered, etc. In England they are appointed by the Archbishop of Canterbury, in Scotland by the Court of Session. In the majority of the States of the Union they are appointed by the governor; in others by the governor with the advice of the council and in the District of Columbia by the President, and they derive their particular powers from statute provisions. In Rhode Island they are elected annually by the general assembly. In New

York the statute which defines their powers in respect to foreign and inland bills, drafts and notes, confers upon them the further authority "to exercise such other powers and duties as by the law of nations and according to commercial usage, or by the law of any other State, government or country, may be performed by public notaries." In New Hampshire, in addition to the usual powers of the office, notaries may take depositions, and acknowledgments of deeds before them have the same validity as those made before justices of the peace. Similar provisions are found in the statutes of Connecticut and Rhode Island. In New York State women are occasionally appointed notaries by the Governor. They cannot act in cases in which they are interested.

NOTATION, Arithmetical, any mode of designating number by marks or figures. See NUMERALS; ARITHMETIC, HISTORY OF; DECIMAL FRACTION.

NOTCH, The. See CRAWFORD NOTCH.

NOTE, (1) *in law and business*. (See PROMISSORY NOTE). (2) *In music* a character which, by its place on the staff, represents a sound, and by its form determines the relative time or continuance of such sound. See MUSIC.

NOTHING TO WEAR, title of a poem, by William Allen Butler (1825-1902), a well-known New York lawyer, satirizing the frivolity and extravagance of the American women. This verse, which begins "Miss Flora McFlimsy of Madison Square," published anonymously in *Harper's Weekly* in 1857, had a wide circulation and was translated into French and German.

NOTHOSAURUS, a genus of small sauropterygian reptiles, allied to the plesiosaurs and the type of a family (*Nothosauridae*) which includes several genera confined to the Triassic period, and prevalent as fossils in the Old World, especially in the German Muschelkalk formation. Their necks were long and terminated in an elongated skull with crocodile-like jaws armed with strong teeth; the limbs were comparatively long and slender. Their height exceeded nine feet six inches. Consult Zittell-Eastman, 'Text-book of Palæontology' (Vol. II, 1902).

NOTICE, (1) information, warning, or intelligence given in any manner, as by personal service; also, the instrument itself by which notice is given. Originally notice meant knowledge, surviving in the legal phrase judicial notice, signifying the acceptance by courts of the verity of well-known events or facts without the necessity of proof. There are two kinds of notice—actual and constructive. Actual notice is reliable information directly communicated either orally or in writing to the person to be charged. Constructive notice is such knowledge as the law presumes to exist, even if never communicated to the person to be charged. Thus in the case of property deeds which have been recorded in compliance with statute, such records are held to be constructive notice to all mortgagors, purchasers, etc.

A notice of dishonor of a negotiable instrument fixes the liability of an indorser thereof, and must be given usually not later than the day following, unless, after due diligence, the

indorser cannot be found. It may be oral or in writing, and must give a description of the dishonored investment.

Notice must be given, in certain cases, by a landlord to terminate a tenancy, as one from year to year or at will. Usually this is fixed by statute.

If a person acquires land with notice of a prior equitable right, he cannot defeat that right by acquiring the legal title. On the other hand, if he acquires such land without notice of facts sufficient to put him on inquiry he will be protected.

If a creditor assigns a debt, the assignee must give the debtor notice, and if he does not do so, the debtor will be protected if he pays the assignor and not the assignee.

Notice is often required by statute in certain cases, as notice by a plaintiff to a defendant of an action to be brought, notice by advertisement instead of personal service, notice given by one person to another in a proceeding to produce written instruments in his possession or subject to his order, etc.

Notice is important in pleading, as where notice is necessary to fix a liability, it must be pleaded in the declaration or complaint of the plaintiff as having been given.

In cases of insurance on ships, a notice of abandonment is frequently necessary to enable the assured plaintiff to proceed as for a total loss when something remains to be saved, in relation to which, upon notice, the insurers might themselves take their own measures. Bouvier's Law Dict. (1914 ed.) s.v.

As a general rule, notice to the agent in the same transaction is notice to the principal, but there are exceptions to this. For example, if an agent is acting adversely to his principal, his knowledge is not held to be the knowledge of his principal, and likewise a principal cannot be held responsible for the knowledge of his agent when it is not the duty of the agent to communicate such knowledge to his principal.

NOTKER, nōt'kēr, two Swiss monks of the monastery of Saint Gall. SAINT NOTKER BALBULUS (the Stammerer): b. Thurgau, about 840; d. Saint Gall, 6 April 912; is best known for his adoption of the simple Roman or Gregorian chants, and for his words for many sequences, the most famous being 'Media vita in morte sumus.' He was canonized 1513. NOTKER LABEO (Thick Lipped; sometimes called "Teutonicus," the German); b. about 950; d. 1022; founded a great school of translators, who, working under his name, translated into German Boethius, the Psalter, etc., and thus left important documents for the study of Old High German in the 10th and the 11th centuries. The version of Labeo and his school are edited by Piper (1883-84). Consult Kelle, 'Die Sankt Gallen deutschen Schriften und Notker Labeo' (1888).

NOTO, Sicily, a city and episcopal see, three miles from the Mediterranean, and 27 miles by rail southwest of Syracuse. Its chief buildings are a fine cathedral and town hall. It has manufactures of olive oil, vegetable fibre, wine and macaroni, and quarries of limestone. Noto dates from 1703, when it replaced the ancient Netum, overthrown in 1693 by an earthquake. Pop. of commune, 31,625.

NOTOCHORD, or **CHORDA DORSALIS**, a rod of gelatinous tissue forming the main skeletal axis in the young of all Chordata (q.v.) and in some persisting as the only support of the body throughout life. It arises in development from the mid-dorsal line of the entoderm (see EMBRYOLOGY), becomes cut off from this parent layer and comes to lie as a continuous unsegmented structure between the digestive tract and the central nervous system. Around it is formed an envelope, the notochordal sheath, and in the vertebrates the bodies or centra of the vertebræ arise. In the lower vertebrates parts of the notochord persist throughout life (for example, filling the cavities in the ends of the vertebræ in fishes), but in the higher forms the notochord is almost entirely replaced by bone and the inter vertebral ligaments, the sole remnants of this structure in man being the so-called *nucleus pulposus* of these ligaments. See AMPHIOXUS; ASCIDIAN.

NOTOGÆA, nō'tō-jē'a ("south-earth"), a name derived from two Greek words *notos*, south, and *gaia*, earth. Notogæa was used to describe the great faunal region that embraces the whole Southern Hemisphere with the exception of Africa. It originated with Huxley in 1868 who thought that Australasia and South America, two remote continents peculiarly related by the fact that marsupials (kangaroos, etc.) are found in both and not elsewhere, could be described as one zoographical region. The word notogæa, therefore, connects these two continents and makes them one for purposes of study and classification of fauna. It is believed that in ancient times there was no ocean between these two continents and that the land was continuous. Notogæa is sometimes used as the equivalent of the Neotropical region — Central America and the Antilles; but is not in general use.

NOTONECTIDÆ. See FRESH-WATER INSECTS.

NOTORNIS, a genus of gigantic rail-like birds of the South Island of New Zealand without the power of flight. The genus was first known by fossil remains named *Notornis mantelli*. Subsequently living examples were found, the last of which is preserved at Dunedin; but it is supposed that none now exist. Norfolk Island formerly had another species, pure white, but it was exterminated by early white visitors to the island; the skin of one is preserved in Vienna. Consult Newton, 'Dictionary of Birds' (1896).

NOTOTHERIUM, a genus of fossil marsupials found in Upper Pliocene deposits in South Australia, allied to *Diprotodon* (q.v.) but smaller.

NOTRE DAME, Cathedral of. See PARIS.

NOTRE DAME, nō'tr dām, **University of**, a Roman Catholic institution in charge of the Fathers of the Holy Cross, at Notre Dame, Ind. It was founded in 1842 and chartered two years later. It has 13 full collegiate courses besides courses in art and music. The courses lead to the degrees of A.B., B.S., Ph.B. and B.L. The equipments for all laboratory and applied science work are exceptionally good; the science building and furnishings are valued at \$500,000. The departments of natural science received great assistance in their foundation work from the

personal attention of the scientist, Very Rev. J. A. Zahm (q.v.). The frescoes and a number of the oil paintings are by Gregori, and are of remarkable beauty and power. To encourage good works along spiritual and intellectual lines, the university presents each year a medal called the "Lætare Medal" to some Roman Catholic layman or woman who has done some special good work for the benefit of humanity. Two regular publications are issued from the university, but one, *Ave Maria*, is not a distinctively university periodical. Affiliated with the university are several schools for the brothers, novices and young priests of the Congregation of the Holy Cross, and on the grounds is the Provincial House of the Order for the United States. The university has also several preparatory schools in different parts of the United States. There are connected with the university an average of 108 professors and instructors; 1,950 students. The library contains 110,000 volumes, and 10,000 other volumes in departmental libraries. The scientific apparatus, machinery and buildings with their furniture together with the other property are valued at \$4,500,000.

NOTRE-DAME DE PARIS, by Victor Hugo (1831), is the most important historical novel of French 19th century romanticism. Written in hot haste in the course of a few weeks, it is almost bewildering in its wealth of vocabulary and flow of language. Yet the plot, placed in the 15th century, is slender and unreal. It tells the story of a gypsy girl, Esmeralda, in love with a worthless young captain, Phœbus de Châteaupers, and herself loved by the priest, Claude Frollo, and the hideous hunchback bell-ringer of Notre-Dame, Quasimodo. Esmeralda is falsely charged with the murder of Phœbus, Quasimodo kills his protector, Claude Frollo, and fights the mob, not knowing that it has come for his rescue. The novel is full of Victor Hugo's characteristic qualities and defects. It thrills by its melodramatic episodes and climaxes, but it bores at times by its long descriptions and tedious digressions. The characters are often marionettes or the mouthpiece for the author's views. It abounds in the antitheses dear to Hugo, whether between the elements of a human being's character, as the hideousness of Quasimodo and the ardor of his affection and gratitude, or between great human influences, such as are expressed in the often quoted 'Ceci tuera cela,' the printed book which destroys the spirit of mediævalism and its architecture. It is, indeed, as an emotional reconstruction of the Middle Ages that the book has its chief merit. Victor Hugo has taken the old Paris Cathedral Church of Notre-Dame as the embodiment of the spirit of the past. Not only does it seem itself, in the course of the work, to become instinct with life, but it has grouped about it the congested existence of the old 15th century town—its crowded confusion, its mystery-plays, court trials, executions, the King of France himself and the beggars and murderers of the Cour des Miracles. 'Notre-Dame de Paris' is a sort of melodramatic prose epic of tremendous power and of many blemishes.

CHARLES H. C. WRIGHT.

NOTT, Charles Cooper, judge: b. New York, 16 Sept. 1827; d. 6 March 1916. He was

graduated at Union College, of which his grandfather, the Rev. Eliphalet Nott, was president. He practised law in New York City until the Civil War began, when he was commissioned captain in the Fifth Iowa cavalry. In the second year of the war he became colonel of 176th New York Volunteers. He was captured while wounded at Brashear, La., and spent 13 months in a military prison in Texas. President Lincoln, of whom he was a close friend, appointed him a member of the United States Court of Claims and later President Cleveland appointed him chief justice of that court. He resigned in 1905.

NOTT, Eliphalet, American clergyman and educator: b. Ashford, Conn., 25 June 1773; d. Schenectady, N. Y., 29 Jan. 1866. He was left an orphan at an early age, and was brought up by his brother Samuel in Franklin, where he taught to obtain means to enter college. He was graduated from Brown University in 1795 and entered the Presbyterian ministry the same year. After holding pastorates in Cherry Valley and Albany, N. Y., he became president of Union College in 1804, where he remained till his death. This institution was then in its infancy with small funds and neither suitable buildings nor apparatus. He at once set about its rehabilitation and secured funds through a lottery permitted by act of the State legislature. He bequeathed to the university property worth \$500,000. He invented the first stove for burning anthracite coal and secured various patents on heating apparatus, through which means he amassed a large fortune. He published 'Counsels to Young Men' (1810); 'Lectures on Temperance' (1847). His funeral sermon on the death of Alexander Hamilton was widely famous. Consult 'Memoirs' by Cornelius Van Santvoord, revised by Taylor Lewis (1876).

NOTT, Josiah Clark, American ethnologist and physician: b. Columbia, S. C., 24 March 1804; d. Mobile, Ala., 31 March 1873. In 1824 he was graduated at the South Carolina College and from the medical school of the University of Pennsylvania in 1827. After further study abroad he established himself in Mobile, and in 1858 founded a medical school there, which became a branch of the State University. During the Civil War he was for a time on the staff of Confederate General Bragg. With G. R. Gliddon (q.v.) he wrote 'Types of Mankind' (1850) and 'Indigenous Races of the Earth' (1857), the purpose of which was to oppose the theory of the unity of mankind. He was sole author of 'The Connection Between the Biblical and Physical History of Man' (1849); 'The Physical History of the Jewish Race' (1850); 'Types of Mankind' (1854).

NOTTEBOHM, nôt'tè-bôm, Gustav, German composer: b. Lüdenscheid, Westphalia, Prussia, 12 Nov. 1817; d. Grätz, Germany, 1 Nov. 1882. He served in the German army at Berlin in 1838-39, but continued his musical studies, and there formed a friendship with Schumann and Mendelssohn, through the influence of the latter obtaining his discharge from the army and becoming a composer of note. Among his works are 'Ein Skizzenbuch von Beethoven' (1865); 'Studies on Beethoven' (1873); 'Mozartiana' (1880); 'Catalogue of the Published Works of Franz Schubert' (1874).

NOTTINGHAM, nôt'ing-am, Heneage Finch, 1ST EARL OF, English statesman: b. Kent, England, 23 Dec. 1621; d. London, 18 Dec. 1682. He was educated at Oxford, studied law and was admitted to the bar of the Inner Temple in 1645. At the Restoration his reputation as a lawyer raised him to the post of Solicitor-General; in 1661 he was elected member of Parliament for the University of Oxford and was made a baronet, in 1670 became Attorney-General, and in 1673 lord-keeper. He was made Lord Chancellor in December 1674, in which office he showed remarkable ability and discretion. In the same year he was made Baron Finch, and in 1681 became Earl of Nottingham. His powers as an orator were highly rated; and Dryden has given to posterity his portrait in 'Absalom and Achitophel,' under the character of Amri. From his time dates the unquestioned supremacy of the Commons over money bills; and he has been called the "father of equity." He was imbued with a persecuting spirit toward the Non-Conformists.

NOTTINGHAM, England, a city and civic county, capital of Nottinghamshire, on the Leen, near its junction with the Trent, 124 miles northwest of London by rail. It occupies a picturesque site overlooking the Vale of Trent. The castle, which crowns the summit of a rock, rising 133 feet above the level of the Leen, was originally built by William the Conqueror as a means of overawing the outlaws frequenting the recesses of Sherwood Forest. Dismantled during the Protectorate, it subsequently became the property of the Duke of Newcastle, who in 1674 erected a large mansion on part of the site. This, after being partly burned in riots connected with the reform movement in 1831, now contains the Midland Counties Art Museum, free library, etc. The church of Saint Mary is a cruciform structure in the Perpendicular style. The Roman Catholic Cathedral of Saint Barnabas was designed by Pugin. The principal educational and literary institutions are the University College and Technical School, High School for Boys, the Blue-Coat School, the School of Art, the Albert Hall and the Mechanics' Institute. An arboretum covering 18 acres is a feature of the town. The staple manufactures are cycles, hosiery and lace, the latter being a specialty. There are also manufactures of cotton, woolen and silk goods and of articles in malleable and cast iron. Nottingham was a place of importance in Anglo-Saxon times and was twice or thrice taken by the Danes. Charles I raised his standard here in 1642, and next year the town and castle were taken by the Parliamentarians. At Nottingham, Richard Arkwright first erected his spinning jenny. Serious riots, occasioned by the introduction of machinery, took place in 1811-12 and 1816-17. Nottingham is the seat of a United States consul. Pop. 259,904.

NOTTOWAY (nôt'ô-wā) INDIANS, an American tribe of the Algonquin family, formerly residing along the Nottoway River, in Virginia. They were very similar to the Tuscaroras of North Carolina. In 1785 about 400 survivors of the tribe occupied a reservation of 27,000 acres. As late as 1827 they kept up a tribal organization in Southampton County.

NOTUS, the south wind or (more exactly) southwest wind.

NOUE, François de la, frân-swâ dè lâ noo, French Huguenot captain: b. near Nantes, 1531; d. Montcontour, 4 Aug. 1591. He was a member of an old Breton family, fought in Piedmont under Brissac, became a Protestant in 1557, and was one of Coligny's bravest lieutenants. In 1570, at the siege of Fontenay-le-Comte, he was wounded in the left arm, and after its amputation wore an iron mechanism to hold the bridle, thus winning the nickname of "Bras de Fer," or "Iron Arm." He fought in Flanders with great success from 1578 to 1580, when he was captured by the Spanish. His five years of captivity were occupied with the composition of his 26 'Discours politiques et militaires' (1587). He fought under Henry of Navarre at Senlis, Arques, Ivry and Lamballe, and was mortally wounded in the last fight. Consult the biography by Hauser (1892).

NOUGUÉS, nōō'gā', Jean, French composer: b. Bordeaux, 1876. He early gave evidence of unusual talent by writing a good opera before he was 16. His father then sent him to Paris to study. His opera 'Thamyris' (1904) was successful and was followed by 'La Mort de Tintagiles' (1905); 'Chiquito' (1909), and 'Quo Vadis' (1909), which made a tour of the world. It was represented in New York, Chicago and Philadelphia in 1911. In 1911 Nougues produced 'La Vendetta'; in 1912 'La Danseuse de Pompeii' and 'L'Aiglon,' and in 1914 'L'éclaircie.' He has also composed ballets and pantomimes.

NOUMEA, noo-mā'a, Pacific Ocean, city and capital of the French colony of New Caledonia, an island in the Pacific Ocean, 700 miles east of Queensland, Australia. Noumea is situated on the southwestern coast; and, having an excellent harbor, is the chief port. Boats ply between Noumea and Sydney, Australia, and a railway runs to Bourail (90 miles). The shipping is quite large. Noumea possesses a technical school and a branch of the Banque de l'Indo Chine. Pop. 8,961.

NOÜMENON, noo'mē-nōn ("a thing known"), a philosophical term put into currency by Immanuel Kant (1724-1804), the German philosopher. According to Kant's philosophy the noumenon is exactly the opposite of phenomena. Henry Sturt writes: "The term is a relic of an early period of Kant's mental development. In his fully mature or critical position he held that the noumenal world was inaccessible to the speculative reason, and yet that we are not altogether excluded from it, since the practical reason, i.e., our capacity for acting as moral agents, assures us of the existence of a noumenal world, wherein freedom, God and immortality have a real place. The relation of noumena to phenomena in the Kantian system is a most difficult one; and in view of the fact that the acutest intellects of Europe have been engaged vainly for more than a century in reconciling the various passages on the subject, the safest conclusion is that they are irreconcilable. The course adopted by Kant's immediate successors in German idealism was to reject the whole conception of noumena, for the reason that what is essentially unknowable has no existence for our intelligence. Kant, however, protested against this development when it was propounded by Fichte, and held that he had precluded it by his "refutation of idealism." He

stood unshakably to the belief in an absolutely real world behind phenomena. Kant saw, what so many of his successors failed to see, that the world as we know it is an expression of power; and he could not imagine whence the power could come if not from a world beyond phenomenon." See KANT.

NOUN, a word or name denoting a person, place or thing. It is one of the eight "parts of speech." The word comes from the Sanskrit *nāmen* (name) and has passed with few changes into every language; for instance in Zend it is *nāmen*; Persian, *nām*; Afghan, *nām*; Armenian, *anum*; Greek, *onomar atos*; Latin, *nomen*; Anglo-Saxon, *nama*; Scandinavian, *namm*; etc.

In the childhood of the world, when people began to talk, they first tried to find sounds and words that would describe, or stand for, the persons, places and objects around them. As races advanced they tried to find names for emotions and abstract ideas. Proper names were derived from common names; in other words, a noun became a proper noun when a common name was applied to a particular person, or place, or thing. It is to the Greeks that we owe our "parts of speech." They had also the noun and pronoun (the word that stands for a noun). Nouns are, of course, subject to different rules in different languages. Here are given a few general ideas regarding the noun in our own language. The word noun denotes any object of which we speak, whether animate or inanimate, material or immaterial. Nouns are proper when they are names of individual persons (John), places (Paris), things (Onion); nouns are common when they apply to a class of objects (as book, chair, house, idea, emotion); collective, when they represent an aggregate of things or people (as fleet, army, crowd, swarm, flock); material, when they denote the names of materials or substances (as gold, snow, water); and abstract when they define the names of qualities (as beauty, virtue, grace, energy, wisdom, evil).

Some of the older grammarians included the adjective under the noun, distinguishing their types of word as noun-substantive and noun-adjective.

Nouns have person, gender, number and case. There are three persons; first, second and third: (1) person speaking; (2) person spoken to; (3) person spoken of. Gender is the distinction of sex. There are four genders: masculine, feminine, common and neuter. Masculine and feminine are self-explanatory. The common is used for such words as may be either male or female—parent, child, bird, cat, etc. The neuter gender denotes the name of objects which are neither male or female (book, chair, pencil, house). A notable exception is ship, which is of the feminine gender.

Number shows how many persons, places or things are intended. Nouns have two numbers: Singular and plural. English nouns have three cases: (1) the nominative, the doer or agent (subject of the verb); (2) the possessive, denoting possession or ownership; (3) the objective, the object of the action, or relation. The plural of English nouns is usually formed by adding s or es to the singular. There are, how-

ever, several exceptions to the rule, such as foot, plural feet; tooth, teeth; mouse, mice; goose, geese; cow, kine; man, men; woman, women; child, children; ox, oxen. Some words, sheep, deer, etc., have the same spelling for both singular and plural. In Old English the plurals of a certain number of substantives (nouns) were formed by mutation of the root vowels as fot, fet, or boc, bac. In modern English this system of inflexion has been preserved in some cases as foot, feet, and altered in other cases as book, books. Forms in er and en used earlier as plurals for nouns in English have almost entirely disappeared from the language. In Middle English, as in Modern English, oxen is the plural of ox, but even the plural for eye has disappeared.

Also in Middle English the suffix *er* existed in many words which had been originally of the neuter gender: the plural of child was *childer*, of calf *calver*, etc. The old plural of brother was *brether*.

Formation is always going on. One of the ways by which nouns grow is by the addition of a suffix. One of the commonest English suffixes used to make a diminutive is *let*, seen in the comparatively recent words like *brooklet*, *streamlet*, *playlet*. But the word is in reality a development of the older *et* (the French *ette* in *helmet*, *banneret* *cygnet*, etc.) Several of these forms, such as *islet*, *circlet*, *eaglet*, etc., were formed out of nouns which ended in *l*. A comparatively new suffix is *nist*—*tobacconist*, etc. This is an extension of the old suffix (Greek, through Latin into French) *ist*, as in *jurist*, *dentist*, etc., seemingly due to words where the *n* belongs to the root part, —*pianist*, *machinist*, etc.

NOURMAHAL, *noor-ma-häl*, 'LIGHT OF THE HAREM,' the heroine of Thomas Moore's poem, *The Light of the Harem*, in 'Lalla Rookh.' Her quarrel and reconciliation with the caliph, Harun al-Rashid form the theme of the story; afterward she is known as *Nourjehan* —'Light of the World.'

NOURSE, Edward Everett, American theologian: b. Bayfield, Wis., 24 Dec. 1863. He was educated at Lake Forest Academy and University (1883–86), at Macalester College, Saint Paul (1886–87), and was graduated at Lake Forest University in 1888, and at Hartford Theological Seminary in 1891. In 1894–95 he studied in the University of Jena. In 1895 he

returned to the United States to become pastor of the Second Congregational Church in Berlin, Conn., having been licensed to preach by the Chicago Presbytery in 1890, and ordained in the Presbyterian ministry in 1903. He remained in Berlin until 1898, when he became instructor in the Hartford Theological Seminary, holding this position until 1890, when he was made associate professor. In 1905 he became professor of biblical theology in the same institution, which he still (1919) holds. He is also lecturer on biblical theology in Mount Holyoke College. He is one of the editors of the 'Standard Dictionary of the Bible'; a contributor to *THE AMERICANA* and other encyclopedias; and the author of 'Brief Commentary on the Epistles of Saint Paul' (1911), reprinted under the title 'Selected Epistles of Paul' (1915).

NOUVELLE FRANCE, *noo-vël fräns*, or **NEW FRANCE**, the original name given to Canada (q.v.) by the early French settlers.

NOVA AQUILÆ, the name given to a new star which made its appearance 8 June 1918 in the constellation of the Eagle, in the southern stream of the Milky Way, almost on the Celestial Equator. It was first observed by Mr. W. F. Denning of Bristol, England, at 10 P.M. Greenwich mean time. Astronomers declared it to be the most brilliant temporary star that has shown in the firmament since the celebrated one of 1604, and that it was probably the product of a collision between two other stars thousands of years ago. Its brilliancy waned after a few weeks.

NOVA CÆSAREA, the Latin name for New Jersey.

NOVA CONSTELLATIO COINAGE, two silver coins proposed by Robert Morris in 1783 for national coinage, but not accepted by the Continental Congress. They were called the Mark and the Quint. See **NUMISMATICS**.

NOVA SCOTIA, *nō'vā skō'shī-a*, one of the three maritime provinces of the Dominion of Canada, comprises a long, narrow peninsula, on the eastern coast of North America, lying northeast and southwest, and the island of Cape Breton, separated from the peninsula on the northeast by the gut of Canso, 16 miles long and from ½ mile to 2 miles wide, and Chedabucto Bay. The dangerous Sable Island, surrounded by a sand bank on which many ships have been wrecked, is a dependency of Nova Scotia, from which it is distant about 90 miles in lat. 43° 59' N. at its eastern end, long. 59° 45' W. The whole province, including Cape Breton, lies between lat. 43° 25' and 47° N. and long. 59° 40' and 66° 10' W. The greatest length of the peninsula is about 280 miles and its greatest width from 50 to 100 miles. It is bounded north by the Straits of Northumberland and the Gulf of Saint Lawrence, south and southeast by the Atlantic Ocean, and northwest by the Bay of Fundy. The island of Cape Breton, whose extreme length is 100 miles, extreme width 85 miles, is almost equally divided by an inland sea, the Bras D'Or Lake. The peninsula has an area of 17,453 square miles, and Cape Breton 3,975 square miles, total, 21,428 square miles. Sable Island is 25 miles long and 1¼ wide, and consists of sand hills thrown up by the sea, on which grasses grow which

maintain many wild horses. (For map see under New Brunswick.)

Topography.—The surface of Nova Scotia proper is undulating, and the scenery varied but not grand. Three ranges of highlands, with a general direction of from southwest to northeast, their general features clearly showing them to belong to the Appalachian Range, diversify the surface. These, roughly, are the range extending along the Atlantic coast from Cape Sable to Cape Canso, which are chiefly of Lower Cambrian formation, except for a belt of intrusive granite that stretches from Cape Sable to Chebucto Head, near Halifax; the Cobequid Mountains, which rise to a height of about 1,050 feet and extend from the Bay of Fundy on the north or isthmian side of the province, through the counties of Colchester and Cumberland to the vicinity of Pictou; and a detached, narrow ridge of trap, known as the North Mountain, about 700 feet high, which extends along the Bay of Fundy, from Digby County to the steep headland of Blomidon, in Kings County, near the entrance of Cobequid Bay. The rock formation of Cape Breton is similar to that of Nova Scotia proper, but is more irregularly distributed. The chief features of the surface of Nova Scotia were left marked as at present by the great earth storm of the later Devonian period. The fertile valleys between the three ranges of hills are respectively of Upper Silurian, Devonian and Carboniferous origin. The northwest side of the peninsula is deeply indented by large arms of the sea, separated by steep promontories. The Atlantic side is penetrated everywhere by inlets of greater or less size, the most important of which are Chedabucto Bay, Halifax Harbor and Chester Basin. The north shore, on the Gulf of Saint Lawrence, is comparatively smooth and uniform in its coast line, and this is true also of the eastern coast of Cape Breton, while the other sides of this island are very irregular. The peninsula has about 400 lakes, of which Rossignol in Queen's County is the largest. The Bras D'Or Lake in Cape Breton covers an area of 500 square miles, or about one-sixth of the entire area of the island. The climate of Nova Scotia, tempered as it is by the Gulf Stream, which flows very near its southwesterly end, is comparatively mild, and especially in the sheltered Cornwallis and Annapolis valleys is favorable to comfort and health. The average temperature is 65° F. in summer, 25° F. in winter. The average rainfall for 27 years (1874–1900) was 38.1, average snowfall for the same period 75.4, total precipitation 45.6. On account of its freedom from extreme heat Nova Scotia has become a popular summer resort for United States people, especially of the Eastern and Middle States. The province contains many rivers, but few of them are over 50 miles in length. In the valleys the soil is of great richness, and Nova Scotia is noted for its vast tracts of inexhaustibly fertile diked marsh land, in earlier or later times by patient industry reclaimed from the sea. This marsh land lines the head waters of the Bay of Fundy and spreads far inland up the valleys of its river tributaries. In general, alluvial deposits are formed in river basins by materials washed down from higher levels by fresh-water floods; here the whole deposit is of tidal origin, the re-

sult of a landward rather than a seaward transportation. Every incoming tide is freighted with a finely comminuted sediment, the produce of the wearing action of the currents upon the sides and bottom of the bay. The elements of this sediment are trap and new red sandstone, the latter being the greater element. Its detritus consists of a large percentage of silica, a little clay, the iron which mainly determines the reddish color of the deposit, and the calcareous matter which served as cement in the parent rock. The great fertility of this alluvium may be seen in the fact that the Annapolis, Cornwallis, Grand Pré and Cumberland marshes have been producing annually for over two centuries from two to four tons per acre of the finest hay. After the hay has been removed the dikes are converted into autumn pastures for cattle, who fatten more rapidly on their luxuriant after-growth than on any other kind of food. The reclaiming of these dikes from the daily tides, which if permitted to rush in will destroy the grass for a year, was begun by the Acadian French and energetically pursued by their successors, the New England people who came in 1760–61. The flora of Nova Scotia is much the same as in other sections of Canada south of the Saint Lawrence. The woods are maple, elm, walnut, oak, tamarack, spruce, pine and other woods, hard and soft.

Agriculture.—The most important industries of the province are agriculture and fruit growing, fishing, mining and lumbering. Of late, however, a good deal of activity has been shown in manufacturing of various kinds. Nova Scotia has an area above tide level of 13,483,671 acres, of which 5,260,455 acres are occupied, and 1,257,449 acres are improved. Of this improved land, 40,474 acres are covered by orchards and nurseries, apple orchards of great extent occupying a great part of the fertile "Annapolis Valley," which includes the counties of Annapolis, King's and Hants. Pears, plums, cherries and peaches and small fruits, especially strawberries, are also raised in considerable quantities. In 1910, 540,589 acres of the province was hay land, 30,827 was planted with potatoes, 96,309 with oats and 12,909 with wheat. In 1900 the value of field crops was estimated at \$8,584,956; in 1910 the value was \$11,005,033. Of field crops in 1910, hay and clover were valued at \$6,532,815; potatoes at \$1,739,376; oats at \$1,466,492. In the last 30 years the apple industry has steadily increased, cold storage making possible large shipments of this fruit to the British markets. In 1890, the total yield of apples was 1,051,592 bushels; of plums 9,246 bushels; of peaches 534 bushels. In 1900 the yield was, apples 2,065,104 bushels; plums, 28,931 bushels; peaches, 3,231 bushels; pears, 14,881 bushels; cherries, 16,669 bushels. In 1910 the yield was, apples, 1,666,977 bushels; peaches, 1,043 bushels; pears, 23,506 bushels; plums, 16,984 bushels; cherries, 10,004 bushels. The total value of fruits and vegetables in 1900 was \$1,407,369; the value in 1910 was \$3,026,445; the increase in value of these products in 10 years thus being \$1,619,076, or 115.04 per cent.

Fisheries.—The fisheries of Nova Scotia have always been active, salmon, cod, shad, mackerel, lobsters and other fish abounding in the waters about the coasts, some of these being

plentiful in the rivers. The value of the total catch in 1900 was \$2,112,022, an increase of \$399,288, or nearly 23 per cent over the value in 1899. The number of men employed in fishing vessels and boats in 1900 was 25,212, of persons employed in lobster-canning factories, 6,447. The value of all fisheries for the fiscal year ending June 1903 was \$8,000,000, and the number of men employed was 29,529. In 1910 the total value of all fisheries was \$10,119,243, the number of persons employed in this industry being 26,568. Fishing receives from the Dominion government a subsidy outside of bounties of about \$400,000 a year. In many parts of the province game is plentiful, bears, foxes, deer and smaller animals being found in considerable numbers. The value of furs taken in 1910 was \$22,748. The total value of forest products in 1910 was \$3,409,528.

Minerals.—Nova Scotia is remarkably rich in minerals, its coal fields being apparently almost inexhaustible, and gold, lead, copper, manganese, gypsum and barytes being found in abundance. For the year ending 30 Sept. 1901 the sales of coal aggregated \$3,119,335, the province of Quebec being the largest consumer. The province has 11 coal mines, five of which are in the peninsula and six in Cape Breton Island. In 1902–93 these mines employed 8,062 persons. There are more than 20 districts where gold is mined, the most important mine being at Sherbrooke in Halifax County. Between 1900 and 1901 the number of tons of ore crushed was 1,358,864, and the value of the gold extracted about \$14,274,054. The value of the gypsum yield in the same year was \$119,278. The mine royalties in 1902–03 reached the large figure of \$487,948.90. The value of mineral products in 1910 was \$17,059,122. In this year, 5,889,193 tons of coal were marketed, at a value of \$13,812,887.

Manufactures.—In 1902–03 the value of manufactured products exported from Halifax reached the sum of \$766,164. Among the chief manufactures are agricultural implements, biscuits and breads, coke, drugs and chemicals, extract of hemlock bark, fertilizers, furniture, iron and steel, leather and wood pulp. The canning of fruits, milk and meat is receiving much attention. In Cape Breton and the western part of the peninsula considerable leases of Crown lands have lately been made for the development of the wood pulp industry. In various places, owing to the abundance of hemlock bark, tanning is actively carried on, and some attention has long been given to sugar refining and rope and twine making. In 1910 there were 1,480 manufacturing establishments, employing 28,795 persons, the capital invested aggregating \$79,596,341. The value of manufactured products in this year was \$52,706,184.

Transportation.—In 1901 the province had in operation 943 miles of railway; since then this has been increased to 1,360. Telegraph and telephone lines run everywhere and the province has two cable stations, one at Canso and one at Sydney, with wireless stations at Cape Sable, Pictou, North Sydney and Sable Island. At the close of 1901 Nova Scotia had in registration 1,980 vessels with a tonnage of 214,560. In that year she had registered 133 vessels with a tonnage of 14,660. The total number of ships arriving from foreign ports during the fiscal

year ending 30 June 1901 was 3,103; tonnage 419,031. This registration included the ships arriving at 85 ports. Of these Halifax headed the list, with 1,185 vessels and 899,079 tons, Sydney coming next with 361 vessels and 541,455 tons. Halifax is the third port in Canada, Victoria, British Columbia, being first and Montreal second. In 1913 Halifax entered and cleared ships to the extent of 3,182,923 tons; Sydney, 1,115,873 tons; Bridgewater, 66,687 tons; Barrington, 10,592 tons. In 1914 Nova Scotia owned, in 21 ports, 2,098 sailing ships and 416 steamships, with a total tonnage of 135,052. The vessels built in the province, 1911–14, inclusive, numbered 385, with a tonnage of 19,395. In 1912 Nova Scotia had telephones in use over the distance of 32,373 miles.

Banks.—The banks in operation are Bank of British North America; Canadian Bank of Commerce; Bank of Montreal; Merchants' Bank; Bank of Nova Scotia; Royal Bank of Canada. The amount of exchanges of the clearing house of chartered banks at Halifax, 1909–13, according to Bradstreet, was \$105,347,636. In 1900 the amount was \$77,000,000.

Finances.—The revenues of the province come chiefly from a Dominion subsidy of about \$433,000 annually; from mine royalties, which exceeds this sum; from the lease of Crown lands, which in 1901–02 amounted to \$74,735, and from succession duties and other miscellaneous sources. The total revenue from all these sources in 1902–03 was \$1,140,216. In the year ending 30 Sept. 1913 the subsidy from the Dominion government was \$636,667; the revenue from mines was \$852,954. The total revenue was \$1,920,565; the total expenditure, \$1,949,784. The expenditures were less than the revenue by about \$53,000. At the close of the fiscal year ending 30 Sept. 1902 the debt of the province was \$3,766,300. Nova Scotia supports a school for the deaf and dumb and one for the blind, an insane and a general hospital and 24 poorhouses. Criminals are sent to the provincial penitentiary at Dorchester, New Brunswick. The public charities in 1902–03 cost the province \$40,573. In 1912 there were 73 persons sentenced to the penitentiary and two were put to death.

Population.—The population of Nova Scotia is greater than that of any of the provinces of Canada except Ontario, Quebec and Saskatchewan. The population of Ontario in 1910 was 2,523,274; of Quebec, 2,002,712; of Saskatchewan, 492,432. Nova Scotia in the last census year (1921) had 524,579. In 1900 she had 459,574. The adjoining province of New Brunswick had 351,889. In origin, 177,701 are reckoned as English, 145,535 as Scotch, 54,244 as Irish, 51,746 as French, 38,844 as German, 6,541 as negro, 4,179 as Holland Dutch, 1,915 as native Indian, 1,360 as Jewish, 1,089 as Austro-Hungarian. The province has two cities, Halifax, the capital, with a population in 1921 of 57,674, and Sydney (in Cape Breton) with a population of 22,527. It has some 28 or 30 incorporated towns, of which the largest are: Glace Bay (in Cape Breton) with a population in 1921 of 16,992; Amherst, with 9,075; Sydney Mines (Cape Breton), with 7,470; New Glasgow, with 8,959; Yarmouth, with 7,067; Truro, with 7,651. In 1900 Halifax had a

population of 17,723; Sydney, the seat of the steel industry, of 9,908. In 1890, before the steel industry started, the latter had but 2,427.

Education.—Nova Scotia has an intelligent free school system, and there is no appropriation and no demand for appropriation for separate sectarian schools. In each of the 18 counties there is a county academy, the highest department of the public schools, the curriculum of which contemplates the fitting of pupils for college. At Truro there is a Provincial Normal College, in which about a thousand teachers are trained every year. In 1914 the whole number of public schools in the province was 2,724, with a total enrolment of pupils of 106,351. In the high school grades alone there were 8,903. The central control of public education is vested in a council of public instruction, which is identical in constitution with the executive council of the province, and is administered directly by a superintendent of education. Between the ages of seven and 12, attendance at school is compulsory. The schools are supported by local taxation and by subsidy, about two-fifths of the necessary cost being met by government grant and municipal aid. The total expenditure for public education in 1914 was \$1,556,618. Of chartered colleges with degree conferring powers, Nova Scotia ought to have but one, but she has six. Besides, there is the Wesleyan College at Sackville, New Brunswick, just over the boundary between the two provinces, which gets a great many of its students from Nova Scotia. One of these colleges, Dalhousie, at Halifax, is undenominational; the others are all under the domination of sects. King's, at Windsor, is Anglican; Acadia, at Wolfville, is Baptist; Saint Francis Xavier, at Antigonish, is Roman Catholic. The latter sect has also a college known as Saint Anne's, at College Point, in Digby County, and one called Saint Mary's at Halifax. The Protestant colleges are co-educational, the Roman Catholic not. The great wrong of this multiplicity of colleges in a small province is seen in the fact that the whole six, and Mount Allison besides, cannot muster over 1,500 students. The smallest (and oldest) of the Protestant colleges is King's, which in 1914 reported 97 students in all departments, only 46 of these being students of arts. The persistence of all these institutions, to the disregard of advanced learning, is one of the evil results of sectarian religionism. Besides these colleges is a technical college at Halifax, which in 1914 registered 33 pupils, and a College of Agriculture at Truro in connection with the government agricultural farm.

Government.—Since confederation the province has been represented at Ottawa by 10 senators and 20 members of the lower house. It has its own local legislature, meeting at Halifax, and a lieutenant-governor appointed by the governor-general and his council. The local legislature consists of a council of 21 members and a legislative assembly of 38. The executive consists of three ministers with salaries and six without portfolios. The house of assembly is elected by the counties, the municipal units of government being counties and towns. In each of the 18 counties the people elect a county council, which in turn appoints the other county officers. It is necessary to secure the sanction

of the people in order to borrow money, and the lieutenant-governor has a right to veto upon the money-borrowing powers as well as the by-laws passed by the council.

Religion.—All religious denominations are on an equal footing in Nova Scotia and none from superiority of numbers or social standing has any pre-eminent rights. The largest sect in point of numbers is the Roman Catholic, with 144,991 adherents. Then come the Presbyterians with 109,560; the Baptists with 83,854; the Anglicans with 75,315; the Methodists with 57,606; the Lutherans with 7,359; the Congregationalists with 2,690. The strength of the Baptist denomination is due to the fact that late in the 18th century the larger number of the New England Congregationalists in the province became members of this sect, thus reducing Congregationalism within narrow limits. Since 1900 the Baptists and Free Baptists have united and the two sects are now one. The recent movement throughout Canada to amalgamate the Presbyterians, Methodists and Congregationalists has many warm advocates and many opponents, especially among the Presbyterians, in Nova Scotia. Few Nova Scotians in their native province are without some church attachment.

Distinguished Citizens.—Nova Scotia has reared a large number of able and eminent men. Such are Hon. Sir Adams George Archibald, K.C.M.G.; Hon. Sir Edward Mortimer Archibald, K.C.M.G.; Hon. Sir Edward Mortimer Archibald, Kt.; Gen. John Charles Beckwith, C.B.; Rear-Admiral Sir Edward Belcher, R.N., K.C.B.; Hon. Sir Frederick William Borden, K.C.M.G.; Rt. Hon. Sir Robert Laird Borden, K.C.M.G. (the present Premier of Canada); Hon. Sir John George Bourinot, K.C.M.G.; Hon. Sir James Cochran, Kt.; Lieut.-Gen. William George Cochran, C.B.; Hon. Sir Samuel Cunard, Bart; Hon. Sir John William Dawson, K.C.M.G.; Baron Haliburton (Sir Arthur Lawrence Haliburton); Hon. Sir Brenton Halliburton, Kt.; Hon. Sir John Eardley Wilmot Inglis; Hon. Sir William Johnstone Ritchie, Kt.; Hon. Sir John Sparrow David Thompson, K.C.M.G.; Hon. Sir Charles James Townshend, Kt.; Rt. Hon. Sir Charles Tupper, Bart.; Hon. Sir Charles Hibbert Tupper, K.C.M.G.; Rear-Admiral Sir Provo William Parry Wallis, G.C.B.; Hon. Sir Robert Linton Weatherbee, Kt.; Vice-Admiral Sir George Augustus Westphal, K.C.B.; Maj.-Gen. Sir William Fenwick Williams, R.A., G.C.B.; Hon. Sir William Robert Wolsey Winniett, R.N., K.C.B.; Hon. Sir William Young, Kt.; Hon. Joseph Howe; Hon. Judge James William Johnstone, etc. Among the writers of note the province has produced are Thomas B. Akins, D.C.L.; David Allison, LL.D.; Hon. Sir John G. Bourinot; John B. Calkin, LL.D.; Hon. Sir John William Dawson, LL.D.; Arthur Wentworth Hamilton Eaton, D.C.L.; Rev. George M. Grant, D.D.; Hon. Judge Thomas Chandler Haliburton; Rev. George William Hill, D.C.L.; Hon. Joseph Howe; Mrs. Mary Jane Katzmans Lawson; Rev. Arthur J. Lockhart; Hon. Judge J. W. Longley, D.C.L.; Beamish Murdoch, Esq.; J. Macdonald Oxley; Benjamin Rand, Ph.D.; Rev. Silas T. Rand, D.D.; Theodore Harding Rand, D.C.L.; Rev. Edward Manning Saunders, D.D.; Hon. Judge A. W. Savary, D.C.L.;

Miss Marshall Saunders; Rev. T. Watson Smith, D.D.

History.—The Nova Scotian peninsula was the most important part of the ancient Acadia, and its little town Annapolis Royal, in French times called Port Royal, while the province remained in the hands of France, was the chief Acadian seat of authority and centre of influence. The name Acadia or Acadie is first found in the petition of De Monts to the French king for leave to colonize this portion of the New World. The province of New Brunswick was included in Acadia, but not the island of Cape Breton. Nova Scotia's authentic history begins with the landing at Port Royal in the spring of 1604 of Sieur de Monts, a gentleman of the bedchamber of Henry IV of France, who had previously accompanied Chauvin and Pontgravé to the Saint Lawrence. There is a French tradition that a little settlement was made in Cape Breton as early as 1541, but Port Royal was the first settlement ever attempted on any part of the peninsula. De Monts held a commission as lieutenant-general of Acadia with full powers to cultivate and hold the land, to discover mines and to convert the Indians. In his first expedition another nobleman, Baron Poutrincoart, accompanied him. Owing to the failure of the French trading company in 1607 the colony they founded at Port Royal was suspended for nearly three years. In 1610, however, Poutrincoart again came to Port Royal and from that time the town has had a continuous history. When Poutrincoart came the second time he took possession of the houses his people had built in 1604, and it may, therefore, be said that Port Royal is the oldest town in all North America, except Saint Augustine in Florida, which was founded by Spaniards in 1565. Jamestown, Va., was founded by the English in 1607, and Quebec by Champlain in 1608. Shortly after 1610 other explorers came to Port Royal, in their wake coming first Jesuit, then Recollet priests, who soon converted all the native Micmacs (an Algonquin tribe) to the Roman Catholic faith. In 1613 Argal (afterward deputy governor of Virginia) destroyed the fort at Port Royal. In 1621 Acadia was granted to Sir William Alexander, who named it Nova Scotia and helped James I establish the order of Baronets of Nova Scotia. In 1628 Sir David Kirk captured Port Royal for England, but in 1632 the province was restored to France. In 1654 Acadia was surrendered to English troops sent out by Cromwell, but in 1667, by the Treaty of Breda, was restored to France. In 1710 Col. Francis Nicholson finally conquered Port Royal for England, and in 1713 the Treaty of Utrecht confirmed Nicholson's conquest. In 1749 Col. Edward Cornwallis brought out an English colony and founded the town of Halifax, immediately afterward establishing a civil government there in place of the military government at Annapolis. In 1755 because of their persistent refusal to take the oath of allegiance the Acadian French were removed, and in 1760–61 their lands were occupied by some 10,000 New England people who thus started many of the best-known present families of the province. In 1758 a constitution, with an elective assembly, was granted Nova Scotia, in 1763 Cape Breton and Prince Edward Island were annexed to Nova Scotia, but in 1770 Prince Ed-

ward Island was separated. In 1773 began the large Scottish emigration which has given certain counties of Nova Scotia the chief part of their population. In 1776 and 1783 from 30,000 to 35,000 Loyalists, chiefly from New England and New York, poured into the province, the New York Loyalists founding the town of Shelburne and creating in Nova Scotia the first colonial see of the English Church. In 1754 New Brunswick and Cape Breton were both separated from Nova Scotia, but in 1820 the latter was reannexed. In 1848 responsible government was introduced and in 1867 Nova Scotia became a province of the Dominion of Canada. In its history as an English province Nova Scotia has had to the present 35 governors (since Confederation they have been, of course, lieutenant-governors), many of them more or less famous military men. Before the appointment of Lord Dorchester as governor-general of Quebec, Nova Scotia and New Brunswick in 1786, she had also 11 lieutenant-governors, of whom Gen. Edmund Fanning, a Loyalist, was the last.

NOVA ZEMBLA, *nó'va zēm'bla* (Russian, *Novaia Zemla*), two islands in the Arctic Ocean, belonging to Russia, and forming a dependency of the government of Archangel; lat. 70° 30' to 77° N.; long. 52° to 69° E. Area, 350,000 square miles. They are separated by the narrow Matotchkin Shar Strait, and from the Isle of Vaigatz on the south and from the mainland on the east by the Sea of Kara. Their greatest length, northeast to southwest, is about 700 miles; breadth, about 80 miles. The greater part of the interior, which is mountainous, with extensive snowfields, is unexplored. The general slope of both islands appears to be toward Matotchkin Strait, on which the mouths of at least 15 small streams have been counted. Lakes also are numerous. The whole territory is wild and desolate. The coasts swarm with seals, various kinds of fish and vast flights of waterfowl. The interior, which is partly covered with stunted shrubs, short grass and moss, is frequented by reindeer, white bear, ermines and Arctic foxes. Minerals discovered include

coal, gold and copper. In 1596 Nova Zembla was reached by Barentz, who wintered there. It was circumnavigated by Johannesen in 1869 and 1870, and the Kara Sea found comparatively free of ice. It was again circumnavigated by Captain Carlsen in 1871, and partially explored by Lieutenants Weyprecht and Payer in the same year, and again in 1872-74. Other explorations have been made since, and two or three settlements of Samoyedes have been established. Pop. about 100.

NOVACULITE, an extremely fine-grained quartz rock of sedimentary origin. It is used for fine whetstone, oilstone and hones and was formerly made into implements by the Indians. Large deposits in Arkansas and Oklahoma are the source of "Arkansas" stones and "Wichita" stone, the former mostly snow white and highly prized for whetstone.

NOVALIS, nō-vā'lis. See HARDENBERG, FRIEDRICH VON; HEINRICH VON OTFENDINGEN.

NOVARA, Italy, (1) a town in Piedmont, capital of the province of Novara, situated between the Agogna and Terdoppia, 51 miles northeast of Turin. It has an ancient and magnificent cathedral with a lofty tower, an episcopal palace, two colleges, museum, a ruinous old castle and a remarkably fine market-house. The manufactures include silk, cotton, linen, biscuits and organ building. The rice and grain markets are the most important in Piedmont. Pop. about 58,858. Novara is famous for the battle fought there on 23 March 1849 between the Sardinians and Austrians, in which the former were completely defeated, and Charles Albert, in consequence, abdicated in favor of his son, Victor Emanuel. (2) The province consists generally of a large and fertile plain, watered by the Po and several of its tributaries, and well adapted for the growth of rice. Area, 2,548 square miles. Pop. 768,658.

NOVATI, nō-vā'tē, **Francesco**, Italian historian and author: b. Cremona, 1859. From 1883 to 1889 he was a professor in Milan, Palermo and Genoa, returning to Milan in 1892. With Arturo Gal and Rodolfo Renier he founded the *Giornale Storico della letteratura italiana* in 1883. His specialties are the Middle Ages and Renaissance in Italy. Among his works are 'Studi critici e letterari' (1889); 'L'influsso del pensiero latino sopra la civiltà italiana del medio evo' (1897); 'Altraverso il medio evo' (1905); 'A raccolta' (1907); 'Freschi e minii del dugento' (1908); 'Storia letteraria d'Italia: le origini' (1900-09).

NOVATIANISM, nō-vā'shī-an-izm, the doctrine of Novatianus, a priest of the Church at Rome in the 3d century and who is said to have died a martyr's death between 254 and 260 A.D. Novatian had been a Stoic philosopher and carried out the stern, harsh views of that sect in his ministry as a Christian teacher. The schism called after him originated as follows: After the Decian persecution a controversy arose about the manner of dealing with those who apostatized or worshipped idols, before the threat of torture or death (*lapsi*). Novatian at first inclined to advocate their absolution after due penance, but when Cornelius, the Roman bishop, followed this course, Novatian opposed his authority, and was chosen and ordained bishop by three country bishops in op-

position to Cornelius, and thus became the first anti-Pope. He was condemned in councils at Rome and Carthage. The party who shared his views were called Novatians. They held that, in the case of idolatry through fear of persecution, the Church could not absolve the penitent; and this doctrine they extended, at a later period, to all grievous sins. They claimed for themselves a character of especial purity, assumed the name Puritans (*Cathari*) and insisted on the rebaptism of converts to their views. Their rigorous doctrines made headway from Spain to the confines of Asia Minor, and they were strongly represented in North Africa, where they continued to be taught up to the 6th century. See CYPRIAN.

NOVATION, a legal term derived from the Roman law, which recognized three kinds of *novatio*: (1) the substitution of a new debtor; (2) the substitution of a new creditor, and (3) a new contract. Novation as defined to-day signifies the substitution of a new obligation for an old one, the latter being thereby extinguished. The term is of civil-law origin and is rarely used in common law. Novation is a contract consisting of two stipulations: one, to extinguish an existing obligation; the other to substitute a new one in its place. In the civil law there are three kinds of novation: (1) where the debtor and creditor remain the same, but a new debt takes the place of the old one; (2) where the debt remains the same, but a new debtor is substituted; (3) where the debt and debtor remain, but a new creditor is substituted. To constitute a novation there must be (1) a valid pre-existing obligation; (2) consent of capable parties; (3) express intention to innovate. (See CONTRACT). Consult Civ. Code, Cal., § 1530; Civ. Code, Dak., § 863; *Hard v. Burton*, 62 Vt. 314, 20 Atl. 269; *McCartney v. Kipp*, 171 Pa. 644, 33 Atl. 233; *McDonnell v. Alabama Gold L. Ins. Co.*, 85 Ala. 401, 5 South. 120; *Skafer's Appeal*, 99 Pa. 246.

NOVEL, *The*. The word novel (derived from the Latin adjective *novella*, feminine of *novellus*, Italian and Spanish *novella*, French *nouvelle*) signifies literally, when applied to fiction, a new tale, new story or new anecdote: that is, one never told before, or at least one never heard before by the listener. Since the early period of the Renaissance the word, in its slightly variant forms, has been employed in most of the literatures of western Europe, except English, to denote a short fictitious narrative dealing mainly with the incidents and intrigues of ordinary life, and written usually, though not invariably, in prose. This was also the English usage in the 16th century when collections of Italian *novelle* were first translated into English, either directly or through the French. But during the next century the short tale of the Italian type underwent in English large expansion; and the word *novel*, naturally enough, was still retained as the name of the longer narrative, which by the time of Richardson had assumed, to a degree, the structure of the drama and the amplitude of the epic. *Clarissa Harlowe*, eight volumes in the whole, was called a novel. For a certain class of fictions we have also had since the time of Chaucer and before him the term *romance*, which (derived from the Latin adjective *ro-*

manicus, through the adverb *romanice*, "in the Roman fashion") meant at the outset anything composed in the *lingua romana*, that is, in the vulgar Latin tongue, like Provençal, French or Italian. As the early productions in the languages that sprang from the Latin were, in large measure, verse-narratives of love and adventure, the word romance became the general term for them. When at a later period, on the invention of printing and thereafter, these verse-tales were reduced to prose, it was natural that the old word should cling to them. Wherefore it is that *roman* in French and German (*romanzo* in Italian) is to this day the most general term for a prose-fiction, while *nouvelle* or *novelle* is reserved, in the Italian way, for a short story. In English (and also in Spanish) the case is just the opposite. With us, a prose-fiction, whatever its length, which deals realistically with actual life is called, in criticism and conversation, pre-eminently a novel. A prose-fiction which deals with life in a fantastic manner, or represents it in the setting of strange, improbable or impossible adventures, or idealizes the virtues and the vices of human nature, is called a romance. 'Tess of the D'Urbervilles' is a novel. The 'House of the Seven Gables' is a romance. Likewise 'Henry Esmond' is an historical novel, while 'Ivanhoe' is an historical romance.

These distinctions, historical in origin, it will be well to bear in mind. But for the broad treatment of the theme now in hand, the novel must be made to include many fictions in prose and some in verse that do not fall strictly within the meaning of the term. Novels may be divided into two classes. There is, said Stevenson, the novel of incident and the novel of character. In the novel of character, the interest is directed to the portrayal of men and women; and the tale, the story or the yarn is a subordinate consideration. This type of fiction has no date earlier than 'Don Quixote'; it was made a fashion by Richardson and Fielding. In the novel of incident, the interest is directed to what happens; characters, if there be any at all, come only by the way; the tale, the story or the yarn is the main thing. As folktales, this type of fiction belongs to all races and peoples in a primitive state of civilization. As a cultivated literary form, it commonly follows the break-up of the primitive epic. After 'Boewulf,' the 'Nibelungenlied' and the 'Chanson de Roland' come, for example, the romance of King Arthur and the Knights of the Round Table. Consult Ker, 'Epic and Romance' (London and New York 1897).

The Orient.—For centuries before the invention of printing, the professional story-teller was everywhere a most important figure—in the East as well as in the West—and he still retains much of his ancient prestige among all peoples where the habit of reading has not become generally diffused. If he appears first in Egypt, it is simply because the records of Egyptian civilization are the most ancient of all. Just as at later times in the West, tales centred around Charlemagne or Richard the Lionhearted, so it was in Egypt. Among the débris of a most ancient cycle are three short stories known as the 'Tales of the Magicians.' On a day in the third millennium before Christ, Cheops, the builder of the great pyramid, suf-

fering from ennui, called his three sons into his presence that they might entertain him with the wonders wrought by famous magicians. One tells of a crocodile which a magician made of wax and threw it into the river, where it seized and carried away the lover of the magician's faithless wife, as he went out for an evening bath. This story is, so far as content goes, very like a mediæval *fabliau* or *novella*. Another relates that when King Seneferu was one day out on the lake of his palace with the maidens of his court, one of them lost a jewel from her hair, which was recovered by a magician who parted the waves and laid bare the bed of the lake. It is an exceedingly pretty tale. The last son tells of a magician who neatly restored the heads of animals after first cutting them off. Throughout these stories, the most ancient of the world, appears frequently "the chief reciter," who was a sort of master of the revels. In the story-telling of succeeding dynasties, magic gave way more and more to adventure, and the description of manners, especially among the peasantry. 'The Shipwrecked Sailor' (12th dynasty) is the Egyptian 'Robinson Crusoe.' 'The Doomed Prince' (18th dynasty) is a tale of romantic love. The prince, as in many a since popular romance, obtains the princess for his wife by climbing up to the window of her palace supposed to be inaccessible. And 'Anpu and Bata' (19th dynasty), the first part of which runs on the *motif* of Joseph and Potiphar's wife, has a beautiful pastoral setting. What one misses in Egyptian, as in all other ancient fiction, is the portrayal of character, except on the simplest lines.

In India the beast-fable, the fairy tale, the adventure and the love-intrigue have been current from the earliest times. Stories of these several types were, in the old time, usually fitted into the frame work of a single narrative after a very elaborate plan. Bearing most closely upon the fiction of the West is the 'Panchatantra,' a book of fables in which the ways and conduct of men—their friendship, disputes, craft, jealousies and virtues and vices in general—are frankly transferred to the lower animals, the bull, the lion, the crow, the owl, etc. These stories, always didactic in aim, abound in humor, irony and satire. Translated from the Sanskrit into the literary language of Persia in the 6th century of our era, the book passed thence into Arabic about 750 A.D., under the name of the 'Fables of Bidpai'; and finally through the Latin into the modern literatures of western Europe. More remote from our subject are the 'Vetāla—panchavimcati,' a group of 25 fairy tales, well known in English under the title of 'Vikram and the Vampire'; and the 'Katha-sarit-sāgara,' or 'Ocean of Rivers of Stories,' an immense collection of verse-tales of various kinds, composed by Somadeva, a Kashmirian poet of the 11th century. Interesting also as approaching somewhat to the modern picaresque story of low life is the 'Dasa-kumāra-carita' (composed by Dandin in the 6th century), which tells of the adventures of 10 princes. Finally, out of Arabia came to the West 'The Book of the Thousand Nights and a Night,' a work in its kind as great as either of the Homeric epics. This treasure-house of stories consists of beast fables, longer and richer in incident than those

of India, beautiful tales of magic and fairy land and histories and historical anecdotes which localize the scene. Over all is the glamour of the moonlit night and the beautiful princess who relates them. Some of these stories had doubtless been recited for centuries by the professional raconteur, called in Arabic the *rawi*. 'Sinbad the Sailor,' for example, may be older than the 'Odyssey.' But the collection as a whole (which is based upon a Persian original of the 10th century) did not assume definite shape until the 13th century of the Christian era; and the famous 'Ali Baba' and 'Aladdin' exist in no manuscript earlier than the 16th century. Translated first into French and then into English and every language of the west, the 'Arabian Nights,' after scores of imitations, passed into romantic fiction and became a part of it. Scott's 'Talisman' would have been quite different but for this precious inheritance from the east.

The Greeks likewise added to the treasure-house of fiction. Their myths, epics, histories and biographies contained, from Homer to the end, elements clearly novelistic or romantic. The 'Odyssey,' for example, is a skipper's tale, one of many, made beautiful by weaving into it stories, long afloat, of Circe, Calypso, Polyphemus, the lotus-eaters, and the fairy realm of the Phæacians. Though we call it a hero-epic, it is really much like a mediæval romance of adventure. Plato was an admirable story-teller, as well as philosopher. Like Defoe he knew how to give an air of reality to fiction by an accumulation of details, not neglecting to tell by the way how he came by his story. The 'Republic' is perhaps too philosophical in aim for more than mention here. But it is the starting point of the scores of Utopias of western Europe from Sir Thomas More to Mr. H. G. Wells. Xenophon all but discovered the historical novel. In his 'Cyrupædia,' he took for his hero the elder Cyrus as representative of a king who by self-control and vigorous self-training became ruler of the world. Running through the romance is a pretty oriental tale, which tells of the beautiful captive Panthea, tempted by Araspes, but faithful to her husband Abradates. The 'Cyrupædia,' which was translated into French and English in the 16th century, became a model for historical fiction before Scott and gave great impetus to the creation of perfect gentlemen like Sir Charles Grandison. So much and much more may be said for the fiction of ancient Greece. Besides Plato's and Xenophon's, there were many other political, philosophical and historical tales. All along ran the novelistic treatment of heroic legend; moral allegories were at one time the fashion, and with the exploits of Alexander in India came many geographical wonders and several freely invented biographies of the hero himself, which eventually resulted in the Alexander novel or legend, well-known from its later development by the French poets of the 13th century.

The Greek novel as a cultivated *genre* wholly distinct from other literary forms belongs, however, to a period subsequent to Alexander; to Greece in its decadence after the glory of her letters had departed, when the centre of culture was no longer Athens but Alexandria and the cities of Asia-Minor. Then the erotic tale of

adventure took the place of the verse-epic. Of this type the oldest extant specimen is the so-called 'Nimrod Fragment' (1st century, A.D.), which has as subject the love of Nimrod, the legendary founder of Nineveh, for a maiden who may be identified perhaps with Semiramis. The motive for the hero's bravery is not unlike that in the mediæval romance of chivalry. Antonius Diogenes, the Jules Verne of the Greeks, wrote of 'The Marvelous Things Beyond Thule' (2d century), descriptive of a voyage to the North Pole, a descent into Hades, and travels in the sun and moon. To the same century belongs the 'Babylonica' of Jamblichus, a Syrian, so-called because its scene is in and near Babylon. The 'Ephesiaca' of Xenophon of Ephesus (3d century) is built in part on the *motif* of 'Romeo and Juliet.' 'Apollonius of Tyre' (3d century), known in English since the Anglo-Saxon period, furnished the plot of Shakespeare's 'Pericles.' 'Clitophon and Leucippe' by Achilles Tatius of Alexandria (5th century) abounds in marvels, gorgeous descriptions, and metamorphoses. Best of all in this kind is the 'Ethiopica, or Theagenes and Chariclea' by a Syrian who called himself Heliodorus (5th century). The boy and girl lovers, after separation, adventures and miraculous escapes, are finally united and live happily ever after. The involved and complicated structure of this tale was taken over into western fiction by Sir Philip Sidney and the French romancers. One beautiful Greek prose-pastoral of the same period has survived: the sweet and sensuous 'Daphnis and Chloe,' the far distant shadow of 'Paul and Virginia.'

The impossible adventure of the Greek tales, especially of the class represented by 'The Marvelous Things beyond Thule,' did not escape the wit and banter of Lucian, the orator and rhetorician. In his 'True History' he sailed with his mariners beyond the pillars of Hercules, on to the moon and morning star, and to the Elysian fields, where he met with the Homeric heroes. "I know what I am saying is incredible," he stops to remark by the way, "but I shall proceed notwithstanding." Lucian was the model of the burlesque romancers from Cervantes to Fielding. Of grotesque adventure in real life, we have from antiquity one fine example in 'The Golden Ass' of Apuleius (2d century), which, though written in Latin, is thoroughly Greek. Aside from its burlesque, the novel contains scenes of coarse and brutal manners mixed with descriptions and episodes of entrancing beauty, like the story of Cupid and Psyche, than which nothing more beautiful has survived for us from ancient romance.

Mediæval Romance.—The Romans had nothing of their own much like a novel, except perhaps the 'Satiricon' of Petronius Arbiter, descriptive of dissolute life in the time of Nero. Their tales and fables were little more than an adaptation of the Greek. But their language, both written and spoken—in Italy, Spain and Gaul—became the chief medium through which ancient fiction passed to the new nations of the West. The tradition, literary as well as oral, was never quite lost in the darkest period of the Middle Ages. Another source of transmission was the Crusades, when met the East and the West. Many a

medieval tale, clearly Greek or oriental in origin, was brought home by the Crusader and told to one and another until some one put it down in writing. The flourishing period of medieval romance is included in the years between 1150 and 1400. It was then that the poets developed, from Latin sources, the sagas of Alexander, Troy and the elaborate romance of Troilus and Cressida. The new nations possessed, too, their own myths, traditions and legends. Charlemagne and his peers became the heroes of a romantic cycle; and the French poets, working over Celtic matter, produced the great stories of Arthur, Lancelot, Guinevere and the Round Table. Most like the modern novel were the French *romans d'aventure*, which are only loosely connected with traditions and may cut themselves wholly free. There are extant scores of these verse-romances, both in French and in English, like 'Guy of Warwick' slightly Saxon in setting, 'Havelok the Dane,' 'King Horn,' and 'Gawain and the Green Knight,' which is one of the best. Certain of them, Greek or eastern in *motif* or outline, turn upon disguises and beautiful recognition-scenes at the close, just as in Shakespeare's 'Twelfth Night' or 'As You Like It.' Such for example, are the 'Life of Ipomydon' and 'Amis and Amile.' The flower in this kind is 'Aucassin et Nicolette' (part prose and part verse), the story of two lovers of Provence, who, as in Greek romance, are separated to be brought together in happiness at the end. By the side of this charming story may be placed also the less known 'Chastelaine de Vergi,' which announces the intense tragic passion of 'Romeo and Juliet.' More realistic in aim were the *fabliaux*, short poems usually, which dealt with a trick or humorous incident in ordinary life for the purpose of exciting laughter. The main incidents of these tales, mixed with beast-fables, were in many cases transmitted from the East. A point of diffusion was the 'Disciplina Clericalis,' a collection of 26 stories in Latin prose, made by Petrus Alphonsus, a Spanish Jew of the 12th century. Its great successor was the 'Gesta Romanorum' (13th century). Tales of intrigue drawn from these and other sources, when lightly treated in verse, were called *fabliaux*; if neatly turned into Italian prose, they were called *novelle*. At the end of the Middle Ages stands Chaucer, who, gathering up all the current types of fiction, breathed into them the spirit of a delightful personality. On the way to Canterbury, the knight begins the story-telling with a gorgeous romance of chivalry, the squire stops midway in a tale of eastern marvels, the prioress relates the legend of a saint, and the pardoner is ready with an oriental apologue. The Reeve's tale is an expanded *fabliau* and the priest's story of Chanticleer and Dan Russell the fox is a *fabliau* and beast-fable in one. Near Chaucer stands Boccaccio, who in the merry *Decameron* retold in prose the older *fabliaux*, giving thereby vogue to the *novella*. The various types of medieval fiction are described by Gaston Paris, in 'La Littérature Française au Moyen Âge' (2d ed., Paris 1890). Symonds' 'Renaissance in Italy' contains an account of the Italian *novelle* (Vol. V, London 1881).

Caxton to Richardson.—As in the Orient, the medieval story of western Europe, whether

in verse or in prose, was for the most part something to be related by a professional reciter or others in the gathering of friends, in public squares, or in the stately assemblies of lords and ladies. In the longer tales, verse was the more common inasmuch as rhyme was an aid to the memory. There were, however, persons who preferred to read by themselves the current fictions. For this public, various verse-romances about Arthur, Lancelot, and the Holy Grail were remodeled and expanded, as early as the 13th century, into an immense prose-narrative. The habit of reading, already begun, was greatly extended by the invention of printing, with the result that the old verse-romances were everywhere turned into prose, and the short prose-tales were expanded into narratives that might assume the magnitude of an epic or a saga. Conspicuous instances of this transformation are Malory's 'Morte Darthur,' a compendium of Arthurian romance, and the French 'La Fleur des Batailles,' a Charlemagne romance in which Ogier the Dane is the hero. These are but two out of hundreds of examples of what was taking place wherever the printing press was set up. To Caxton and the noble printers that followed him we are indebted for the creation of a prose style suitable to the novel.

The most striking innovations were made at first in the Spanish Peninsula. Out of a Portuguese verse-romance of adventure there grew up in the 15th century, by accretions from many sources, the famous prose 'Amadis of Gaul,' to which final form was given by a Spanish writer named Montalvo. In its outer structure *Amadis* differs from similar medieval tales of knightly adventure in that the narrative drifts on, as in Greek romance, to the marriage of the hero and the heroine. It was the first and the best of the modern romances of chivalry, which soon became so numerous as to fill the library of Don Quixote. In a like manner medieval verse-pastorals were turned into prose, though they usually still retained some mixture of verse. Among the first of them was the Italian 'Arcadia' (1504) by Jacopo Sannazaro. The type was further developed in the Spanish Peninsula by George of Montemayor, whose 'Diana Enamorada' set the fashion for France and England. It was in Spain, too, that some one first had the happy thought of placing behind the scenes of contemporary life a gay scamp to let him relate what he saw there. These so-called picaresque novels, or romances of roguery, began with the anonymous 'Lazarillo de Tormes' (1554) and were popular for a full century. Always realistic in aim and straightforward in movement, the romances of roguery were important forerunners of the modern novel. Akin to them and of still greater significance, was 'Don Quixote,' a vast prose-epic, written in burlesque of the romances of chivalry, but carrying along with its banter humorous descriptions of contemporary manners. Don Quixote and his Squire Sancho Panza were by far the most elaborate characters that fiction had yet produced. And no work comparable with that of Cervantes was to appear again in Spain or elsewhere for more than a century.

In France and Italy the novelistic literature chiefly cultivated at this time, aside from redac-

tions of the older romances and tales, was the *conte* or *novella*. Collections of these short stories were sent forth from nearly every city of Italy, and the 'Heptameron' of Margaret of Navarre became a close rival to Boccaccio's 'Decameron.' The great humorist was Rabelais, who made the farcical adventures of Gargantua and Pantagruel the occasion for social satire, weaving into his story as he went along many a coarse jest in the vein of the old *fabliaux*. He was followed by a group of imitators who tried to 'outdo him in ribaldry and buffoonery, but none of them possessed his immense learning and keen intelligence.

In Elizabethan England, men and women turned to fiction for amusement as well as to the drama. Beginning with Painter's 'Palace of Pleasure' (1566), the Italian *novelle* came into English in shoals; the best of the Greek romances were translated from the French; and the Spanish romances of chivalry, pastorals and rogue-stories were known in part. And whatever England took was worked over into fictions in harmony with her own society. For its wide scope Sidney's 'Arcadia' stands first with its noble chivalry and beautiful pastoral scenes, set in the complicated framework of the Greek 'Ethiopica.' Of slighter texture but none the less beautiful is Lodge's 'Rosalind,' which Shakespeare dramatized in 'As You Like It.' John Lyly's 'Euphues,' highly moral in tone, initiated the romance for the lady's boudoir. Robert Greene, the dramatist, supported himself by writing short tales, such as 'Menaphon,' which he called "love-pamphlets." Of all Elizabethans, Greene was by much the most fertile in incident. Two of his stories, 'Pandosto' and 'Philomela' were freely used by Shakespeare for 'A Winter's Tale' and 'Cymbeline.' Very curious are Greene's attempts at historical romance, like *Ciceronis Amor*, descriptive of "the loves of Cicero which Plutarch and Cornelius Nepos forgot in their writings." Greene also wrote several pamphlets dealing with beggars, rogues and sharpers, but in this kind he was surpassed by Thomas Nash, who ridiculed his rival's love-pamphlets and ironically alluded to him as "the Homer of Women." Nash's 'Unfortunate Traveller or the Life of Jack Wilton' (1594), which relates the adventures and escapades of a young courtier on the Continent, was the most carefully wrought of the English romances of roguery.

After the passing of the Elizabethans and of Cervantes (1616) the main stream of European fiction shifted for a century to France. The English 'Arcadia' and the Spanish 'Diana' were more than matched by the 'Astrée' (1610-27), an immense pastoral covering some 5,000 pages; begun by Honoré d'Urfé, and completed after his death by his secretary. Several writers turned to history for a setting of their romances. In 'Cléopâtre,' 'Cassandre' and 'Pharamond,' La Calprenède dealt in turn with Egypt, Persia and the legendary founder of the French monarchy. He was succeeded by Scudéri, best known for the 'Grand Cyrus' and 'Clélie, ou Histoire Romaine.' In all cases, historical scenes, incidents and characters were merely a disguise for a portrait of contemporary society. Scudéri's 'Cyrus,' for example, was drawn for the great Condé, and her Babylon was the Paris of her time. Near the end

of the line came Madame de la Fayette, whose 'Princesse de Clèves' has long been regarded as one of the classics in French fiction. Along with their pastorals and histories, the French continued to cultivate the stories of bourgeois life in line with the older *conte* and *fabliau*. Such were Sorel's 'Francion,' Scarron's 'Roman Comique,' and Furetière's 'Roman Bourgeois,' in which the aim was, to some extent, the ridicule of contemporary manners in low life. Burlesque in the style of Cervantes or Lucian made its appearance in Sorel's 'Berger Extravagant,' a hit at the 'Astrée,' and in Boileau's 'Héros de Roman,' descriptive of the descent of Scudéri's heroes into Hades to be flogged and cast into Lethe.

Through translation, the ponderous French romances became almost as popular in England and Germany as in the land of their birth. In both countries coteries of fashionable men and women were formed for reading and studying them as if they were all classics. Occasionally there was an imitation, like Roger Boyle's 'Parthenissa' or John Crowne's 'Pandion and Amphigenia.' Outside of their influence was Grimmelshausen's 'Simplicissimus,' the first of the German realistic novels, which described the adventures of a vagabond during the awful desolation of the Thirty Years' War. In this novel the picaresque element is quite apparent as well as in the 'English Rogue . . . a Complete History of the Most Eminent Cheats of Both Sexes,' composed jointly by one Richard Head and Francis Kirkman, a London bookseller. Mrs. Aphra Behn, the dramatist, set the fashion in England for scandalous tales of high life. Among her successors were Mrs. Mary Manley and Mrs. Eliza Haywood. Quite apart from these immoralities was Mrs. Behn's 'Oroonoko,' which gives a realistic account of a royal slave barbarously put to death at Surinam, where the author had lived for some years.

Interesting as much of this 17th century fiction may be, it is, with the exception of the 'Princesse de Clèves' and now and then another story, affected in style and involved in structure. A better and plainer narrative came with Bunyan's 'Pilgrim's Progress,' the newspapers, the biographers and the essayists. Steele and Addison described clearly scenes in London and the provinces; they deftly sketched and contrasted men and women as they knew them, with agreeable banter of prevailing absurdities in dress and conduct. In doing this they were really nearer to the modern novel than the romancers and the storytellers. And so was Defoe. He and Swift wrote the language that men speak in ordinary discourse, making fiction seem like truth. 'Robinson Crusoe' is indeed our prose 'Iliad.' Except for minor details, we have no better narrative in English, and the hero is a typical Englishman of the class to which he belongs, behaving as an Englishman should behave if cast upon a desert island. In France the Spanish picaresque novel was at this time cleverly employed by Le Sage in his 'Gil Blas' for social satire, and Marivaux, in a novel called 'Marianne,' began the delicate analysis of emotion. Not to be forgotten, too, is 'Manon Lescaut,' by the Abbé Prévost, a charming tale on the "divine right of passion."

Richardson to Scott.—For centuries, stories, tales and romances of all sorts had been set adrift; contemporary manners had at times been depicted under the guise of history and the pastoral life, and from the standpoint of rogues and adventurers. But no one, not even Cervantes, had ever been able to keep before him for long the ideal of the novel as we now understand it: to wit, the direct and faithful portrayal of character amid the scenes of real life. Strange to say, too, no one had ever seen that for this end much might be learned from the drama, that a narrative might be made closely and logically dramatic. These discoveries were left for Samuel Richardson, a London printer of no rank and little schooling. The interest in his first novel, to which he gave the name of 'Pamela' (1740), centres about the distress of a beautiful waiting-maid of humble birth. Her mistress dies and then the son and heir tries to win her to a dishonorable alliance. After a protracted struggle of will against will, the young man repents of his evil-doing and marries the young woman whom he would have betrayed. It is a simple story that may be told as here in two or three sentences. But for his treatment of the theme Richardson required two volumes, to say nothing of a continuation. During and after each struggle there were sensations to record; many characters had to be introduced as participants in the action; and the whole narrative was made to move from incident to incident with the logic of the drama, up to a climax and on to a catastrophe. When he had done with 'Pamela,' Richardson had created, perhaps without being aware of it, a novel from which characters emerge as clear and definite as from the drama, and in much greater detail. Richardson attained to his full stature in 'Clarissa Harlowe,' wherein a tragic theme is unfolded with great skill. His career closed with 'Sir Charles Grandison.' The plots of the three novels were developed, oddly enough, by imaginary letters, which pass to and fro between the more important characters.

The formula of the novel once discovered, it was easy for a man practised in letters to improve upon the humble printer. Henry Fielding, essayist and playwright, wrote 'Joseph Andrews' to show Richardson what a novel ought to be, and afterward went on with 'Tom Jones' and 'Amelia.' Fielding was a great humorist in direct descent from Lucian and Cervantes. The novel, as he understood it, was an immense comic-epic running on in the well-polished grooves of the drama, but suspended at intervals that the author might converse with the reader about his art, his fame and the conduct of his characters. Knowing England better than any other man of letters in his day, Fielding conveyed the wealth of that knowledge into characters like Parson Adams, Squire Western and Tom Jones, who always stand out full and complete. While the great master was at work on 'Tom Jones,' Tobias Smollett took the field with 'Roderick Random,' our first novel of the sea, which was followed by 'Peregrine Pickle'; 'Count Fathom'; 'Sir Launcelot Greaves'; and 'Humphry Clinker.' If Fielding was a comic writer who delighted in exposing to ridicule vanities and affectations, Smollett was a satirist who lashed hypocrisy and the darker vices with the glee of a madman. He

had in him also the spirit of fun, which welled up splendidly in 'Humphry Clinker,' "the most laughable story," said Thackeray, "that has ever been written since the goodly art of novel writing began." In the meantime Oliver Goldsmith had condensed the Richardson novel and given it a charming background in country life. From the 'Vicar of Wakefield' dates the brief pastoral-tale since common throughout Europe. Perhaps Laurence Sterne should not be classed with the novelists. He was rather a humorist who played with the novel. 'Tristram Shandy' is a sort of a novel written backwards. After setting out with the prenatal history of his hero, Sterne drops him and reverts to Tristram's uncle and father and elaborates their characters, without much attention to the main story. Of orderly narrative Sterne was, however, a master when he chose to be, as in the death of Yorick and throughout the 'Sentimental Journey,' which is a record of his emotions on a tour through France, from Calais to Paris and on through Languedoc in the vintage season. Sterne's art at the best was exquisite and wonderful, whether in the minute delineation of Walter Shandy and my uncle Toby or in the minor emotional portraits of his sentimental travels. Translated into French, German and other languages, Richardson and Sterne reinforced the stream of emotional literature on the Continent. For France the outcome was Rousseau's 'Nouvelle Héloïse,' and, at a latter date, Saint-Pierre's 'Paul et Virginie,' Chateaubriand's 'René' and Madame de Staël's 'Corinne.' For Germany the outcome was a long line of sentimental novels at the head of which stood Goethe's 'Leiden des jungen Werther.'

Owing to changed social conditions, the novel broke up into new types after the death of Sterne. Among large numbers of people in England and France, interest in the comedy and tragedy that grow out of love and intrigue gave way, in the years before the French Revolution, to the larger social and political relations and to theories of education and government. The novel at once became the popular medium of current speculation, incorporating into itself the tract, the pamphlet and the treatise. The novel of distinct purpose which began with Rousseau's 'Emile,' was continued by many English writers including Thomas Holcroft and William Godwin, the author of 'Caleb Williams.' In other hands the novel absorbed romance. The so-called Gothic romances all sprang from 'The Castle of Otranto,' a nightmarish tale by Horace Walpole. Among Walpole's successors were Clara Reeve; Mrs. Ann Radcliffe, author of the 'Mysteries of Udolpho'; 'Monk' Lewis; and Charles Brockden Brown, the American. In Germany there was a similar tendency to romance and superstition as illustrated by the work of Tieck and Hoffmann.

Meanwhile, a group of novelists, mostly women, held more nearly to older traditions. 'Evelina' and 'Cecelia' by Frances Burney (afterward Madame d'Arblay) brought the public back to London—to assemblies, Ranelagh, the opera, and Drury Lane, where thronged the world of fashion with nothing to do. With Miss Burney began the novel of manners in the most restrictive meaning of the phrase. Hitherto characters had been differentiated by

what they said and did. Miss Burney laid equal stress upon *how* they spoke and *how* they behaved, upon tone, look and gesture. From her art it is an easy transition to the characteristics of Maria Edgeworth. One may pass by, good as they are, Miss Edgeworth's tales of fashionable life and various fictions in which she sought to reform English society from top to bottom, for her stories of Irish life such as 'Castle Rackrent' and the 'Absentee,' wherein first appeared the Irishman as he really is, behaving himself in those ways that seem so absurd to an Englishman, and engaging in no long conversation without one or more of those delightful blunders in speech known as Irish bulls. From Miss Edgeworth's sketches, as she called them, flowed all these Irish tales which for the next 50 years flooded England. Miss Burney and Miss Edgeworth shared one defect, for neither of them knew how to manage a story. Their many natural and vivacious scenes are more or less detached and never firmly held together. But the art of Fielding, long since lost, was now to be regained and refined by Jane Austen, a woman of gentle breeding and charming style. Her first novel to be printed was 'Sense and Sensibility;' then followed 'Pride and Prejudice,' 'Mansfield Park,' 'Emma,' 'Northanger Abbey' and 'Persuasion,' of which the best is the novel one happens to be reading. The scenes of them all were laid in South England, where Jane Austen passed her life. Without employing the conventional devices of the novelist, she was able to awaken interest by the manner in which she developed her story, the nice discrimination between men and women much alike to the ordinary observer, and the wit and irony that accompanied the entire performance. Jane Austen was in a sense the last of her line, completing the work of Miss Burney and Miss Edgeworth; she also set the clock to the delicate impressionism of the 19th century.

Sir Walter Scott.—Scott, equally with Richardson, marks an epoch in the course of European fiction. From the earliest times, as in Egypt and Greece, history had been an adornment to the tale or story. Shakespeare and many others had written historical dramas. The French romances of the 17th century, many of them, were historical allegories. The Gothic writers laid their scenes in mediæval or early modern times. With several romancers just before Scott, history was a still more definite aim, especially with Jane Porter, author of the 'Scottish Chiefs.' But none of Scott's predecessors had the historian's perspective. None of them did much more than project the present into the past. Scott's aim was to restore as carefully as he could the manners and customs of our forefathers, to tell us how they behaved under the stress of civil and political commotions. The historical novel, as Scott organized it, was, then, the novel of manners pushed back, at first one or two generations, and eventually to the Middle Ages. He began in 'Waverley' (1814), with Scotch scenes; and, after exhausting interest in Scotland, he crossed the border, writing 'Ivanhoe'; then he crossed the channel, writing 'Quentin Durward'; and finally he went on to the East, to the camp of the Crusader. All Europe stood in admiration of the extraordinary feat. Scott

was clearly the founder of the historical romance. His numerous imitators in England included Horace Smith, G. P. R. James, W. H. Ainsworth, and in part, Dickens and Thackeray. Under Scott's direct inspiration, Cooper launched his great romances of the forest celebrating the career of Leather-Stocking; and as a challenge to the seamanship of Scott's 'Pirate,' he wrote 'The Pilot,' to be succeeded by other romances of the sea. From Scott, too, proceeded the German historical romances, from Wilhelm Häring on through Gustav Freytag and Georg Ebers. In Italy Scott's influence began with Manzoni's 'Betrothed,' and in France with Alfred de Vigny, Prosper Mérimée and Victor Hugo. Finally, the historical romance was transformed by the elder Dumas, a writer of rare narrative and descriptive powers, into tales of breathless adventure like the 'Trois Mousquetaires.' On Scott and the historical novel, consult especially, Maigron, 'Le Roman Historique' (Paris 1898); and Stephen, 'Hours in a Library' (first series, London 1874).

Varied Types of the 19th Century.—By 1832, the year of Scott's death, romance had run its immediate course in England, though there were many survivals. The passage of the Reform Bill and other legislation led to a break-up of society; the older bourgeoisie fared badly, losing their homes and drifting to debtors' prisons and workhouses; and a new middle class rose to wealth and power. The manners, virtues and vices of the new order became at once the main theme of the novelists. Bulwer-Lytton, who could write at will a history, a sentimental romance, a criminal novel, a ghost story, or a Utopia, well illustrates the transition from romance to the novel of contemporary manners. Dickens was the chronicler of those who had suffered most by political and social changes. Beginning with 'Pickwick' (1836-37), a long series of comic sketches unexcelled in their kind, he definitely struck the humanitarian note in 'Oliver Twist' (1837), which dealt, in humor and pathos, with the workhouse and the new poor-law. He thereafter passed in review private schools, public education, prison discipline, the red-tape of Downing street, delays in the Court of Chancery, graft (we should now call it) in business and the professions, and all sorts of hypocrisy and meanness that oppressed the people. Despite the sordidness of their matter, all of Dickens's novels were ennobled by the author's lofty idealism, and made delightful by a sense of humor that never deserted him. Those that were wrought out of the author's most intimate experience—'David Copperfield,' for example—were no doubt the best; but Dickens could interest when he took, as in 'Hard Times,' a subject about which he knew little or nothing. His Christmas stories were national events. Of immense creative power, Dickens added to fiction hundreds of humorous types, among which are Mr. Pickwick, Sam Weller, Micawber and Dick Swiveller. He was, however, surpassed in fertility by his early French contemporary, Honoré de Balzac, who in the vast 'Comédie Humaine' endeavored to portray every phase of French life, traversing its hell, purgatory and paradise. But what fell without the ken of Dickens was taken up by other novelists. Charles

Kingsley, now better known for 'Hypatia' and 'Westward Ho', canvassed the questions at issue between labor and capital, in 'Yeast' and 'Alton Locke,' drawing by the way vivid pictures of sweatshops and the distress of agricultural laborers. Mrs. Elizabeth Gaskell, in 'Mary Barton' and 'North and South,' described the frightful condition of women and children in the great manufacturing towns of North England. And Benjamin Disraeli created a sensation by his trilogy, 'Coningsby,' 'Sybil' and 'Tancred,' dealing in turn with "the state of parties," "the state of the people," and "the state of the Church of England." Disraeli's first novels, impressive for their scope, were all marked by keen intelligence, wit and mockery. The relation of Dickens, Kingsley, Gaskell and Disraeli to their times is exhaustively treated by Cazamian, 'Le Roman Social en Angleterre' (Paris 1904).

In the meantime Thackeray was depicting, with matchless humor and irony, the ways of the well-to-do middle class to which he himself belonged. 'Barry Lyndon,' the 'Book of Snobs,' various burlesques of contemporary novelists, and a multitude of sketches were succeeded by 'Vanity Fair, a novel without a Hero.' No English novel since 'Tom Jones' had contained so much of real life. It was a humorous transcript of what was going on among the rich bankers and merchants in Bloomsbury, with some invasions into the disreputable aristocracy of Belgravia. In 'Pendennis' Thackeray described much of his own career; and in the 'Newcomes,' he returned, though taking the edge from his irony, to the theme of his first novel. Finally, he carried his realistic methods into history, writing 'Henry Esmond' and the 'Virginians,' of which the former is rightly regarded as the best historical novel in English.

'Esmond' is, however, hard pressed for first place by the 'Cloister and the Hearth,' by Charles Reade, who also wrote several admirable novels under the humanitarian impulse, such as 'It is Never Too Late to Mend.' To the same period belong Charlotte Brontë's 'Jane Eyre,' 'Shirley' and 'Villette,' and her sister Emily's 'Wuthering Heights,' all of which are Byronic in the vehemence of passion. In the United States, Poe and Hawthorne had molded the short-story to a beautiful form, and the latter's 'Scarlet Letter' at once took rank among the great fictions. To Anthony Trollope descended Thackeray's humor, without, however, the master's irony and genius. For 20 years Trollope was the delight of a large audience. He was the easy and amusing chronicler of every-day English life, rising to his highest powers in the tales of cathedral life, which began with 'The Warden' and 'Barchester Towers' and closed with the 'Last Chronicle of Barset.' This series of delightful novels, no doubt, suggested to Mrs. Margaret Oliphant the 'Chronicles of Carlingford,' dealing with the ways of Dissenters. 'Salem Chapel' and 'Miss Majoribanks,' among the best of them, give Mrs. Oliphant a permanent place in the course of English fiction.

With Marianne Evans, known in letters as "George Eliot," there entered into the English novel a new and profound personality. Hitherto moralists and philosophers had tried fiction

with no great success. But George Eliot, besides her large acquirements from books, possessed wit, humor and a fund of fresh observation. Beginning with 'Scenes of Clerical Life,' based upon incidents and traditions brought over from her life as a Warwickshire girl, she published in 1858 'Adam Bede,' her first long novel. It was quite different from any other novel that had ever been produced. True, it ran on the lines of the conventional story of a young woman's betrayal; but beneath the outer sequence of incident was a relentless study of motive, clearly and logically developed from beginning to end. It was the first purely psychological novel ever written. Still more impressive work followed in 'The Mill on the Floss,' 'Romola,' and 'Middlemarch.' At the same time George Meredith was finding his way to the psychological novel. His 'Ordeal of Richard Feverel' appeared in the same year as 'Adam Bede,' but his subtle psychological manner came later, in the 'Egotist' and 'Diana of the Crossways.' Narrower in his outlook than George Eliot, he took fewer characters for his studies, carrying the analysis of motive to a refinement that sometimes rendered him unintelligible. And Henry James has since refined upon Meredith. The stories whereby James first won attention were international episodes, delightfully objective in method, like 'Daisy Miller,' depicting by contrast American and European types and manners. But by 1890, he began very complex studies of unconventional phases of English life, and adopted for his purpose an involved and indirect style, with the result that most readers are now uncertain just what happens in a novel like the 'Golden Bowl,' for the incidents must be largely inferred from the characters.

It is impossible to relate here in detail what has been done for fiction on the Continent since the death of Balzac. In France, Flaubert and Daudet were the great literary artists of their time. Zola, who established the vogue of "the naturalistic novel," described the ugliest aspects of life with a boldness never before attempted in fiction. His influence is obvious in very many English novels, but most of all in George Moore's 'Esther Waters,' by far the best novel we have of the Zola type. Paul Bourget, since 1892, has been the exponent of psychology. Scandinavia's representative has been first of all Björnson. Sienkiewicz, author of 'Quo Vadis' and an impressive trilogy dealing with the struggles between the Poles and the Cossacks, may stand for Poland. Among Germany's numerous novelists are Paul Heyse, author of 'Kinder der Welt'; Spielhagen, who presented his ideal of a novel in a collection of essays on the 'Theory and Technique of the Novel'; and Sudermann, the dramatist, whose pathetic 'Frau Sorge' soon found its way to English readers.

Of modern Russian fiction the founder was Gogol, whose 'Dead Souls' (1842) is a masterpiece of realism and grim humor. Again, Russia produced a novelist of the first rank in Turgenyev, whose art—say in 'Fathers and Sons'—is quite beyond praise; its influence has been long potent in the West. Tolstoi, beginning with 'Anna Karenina,' treated current social problems in novels of absorbing interest. His novels read, not like fiction, but as if they

were genuine documents on contemporary life. To the same period belongs Dostoevski, who, especially in *'The Brothers Karamazov,'* carried minute psychological analysis into the realm of pathology. Of less importance is Gorki, in whose *'Twenty-six Men and a Girl'* is well displayed his talent in the portrayal of hideous scenes among the lowest strata of the underworld. Chekhov, who died in 1904, was then assuming a position in Russian fiction second only to Turgenev. Still, he never developed the perfect art of his predecessor, nor had he the wide sweep of Tolstoi. Representative of his subtle work is the collection of tales called *'The Black Monk and Other Stories'* (1903). Artsybashev came to the front in 1907 with *'Sanin,'* a powerful novel exalting the natural instincts of man against all moral restraint. At the present moment the leader in Russian fiction is Andreev, author of *'The Red Laugh,'* *'The Seven who were Hanged,'* *'Judas Iscariot,'* *'A Dilemma,'* and many other terrible stories. Regarded as a whole, contemporary Russian fiction excels that of all other nations in uncompromising realism.

With the 20th century came, too, a revival of the "biographical novel," which aims to depict the entire career of the leading character or some important phase of his life. This type of novel is an interesting reversion through Dickens and Thackeray to the manner of Fielding and Smollett. Its extreme representative is *'Jean-Christophe,'* by the French novelist, Romain Rolland, running to 10 volumes and presenting in its wide sweep a remarkable view of European life and thought just before the outbreak of the Great War. In English fiction, the new fashion was established by the success of William De Morgan with *'Joseph Vance'* (1906) in the style of a loose autobiography, and deservedly maintained by his *'Alice-for-Short,'* *'Somehow Good,'* and *'It Never Can Happen Again.'* Slightly antedating De Morgan was Samuel Butler's brilliant study in the diabolism of human nature, called *'The Way of All Flesh.'* To the same group belong Arnold Bennett, who won his public with *'The Old Wives' Tale'* and has since written prodigiously; and John Galsworthy, whose best novel thus far is *'The Man of Property.'* Of larger calibre is H. G. Wells, the socialist and reformer, who would make over society in accordance with the facts of biology. Representative of his work are *'Ann Veronica,'* *'Marriage,'* *'The Wife of Sir Isaac Harman,'* and *'The Research Magnificent.'* Somewhat apart from this group, but within it in her reflection of current views on social conventions is May Sinclair, the author of *'The Divine Fire,'* *'The Helpmate,'* *'The Judgment of Eye,'* and *'The Three Sisters,'* all of which are iconoclastic in tone. And during all these years the wonderful portrayer of men and women has been Joseph Conrad, whose readers have been comparatively few.

The Great War gave the novelist a new subject and is profoundly altering his art. The novelist now strives by all means in his power to make his fiction appear as fact. He relates the experiences of an officer or a private at the front, working stories and anecdotes into a sequence; he writes of a man or a woman caught in Germany at the outbreak of

the war; or seeks to tell the world how the war affected him or his friends far behind the battle line. He needs little or no plot. His art is essentially a return to the art of Defoe, whose sole aim was a good tale dressed in the garb of truth. So we have Mrs. Ward with *'Missing,'* and *'Towards the Goal';* Locke, W. J., with *'The Red Planet';* and an unknown writer with *'Christine,'* purporting to be genuine letters out of Germany from a daughter to her mother. Thus far have appeared two very notable novels in this style. They are Well's *'Mr. Britling Sees It Through'* and Henri Barbusse's *'Le Feu'*—the story of a squad under fire.

Howells, who has often interpreted Tolstoi in brief essays, has held firmly to a realistic treatment of current types and manners, eliminating so far as possible the conventional plot which the novel early took over from the drama. His *'Rise of Silas Lapham'* is by far the best American novel of the present generation. Hardy is the English novelist of most thought and substance since George Eliot. He struck the note of his stern realism in *'A Pair of Blue Eyes'* and *'Far From the Madding Crowd,'* and rose to the height of his genius in *'Tess of the D'Urbervilles.'* Mrs. Humphry Ward gained her public with *'Robert Elsmere,'* and after writing several other problem novels, shifted her theme in *'Lady Rose's Daughter'* and the *'Marriage of William Ashe,'* to beautiful women in risky situations. A tendency toward the abnormal in recent fiction, slightly visible in Mrs. Ward, is best represented by Mrs. Harrison's *'Sir Richard Calmady.'* The intensity of Hardy's tragedy, though less well-rendered, descended to Phillips, author of the *'Secret Woman'* and other Wessex novels. His *'Three Brothers'* is almost worthy of his great master.

Toward the close of the 19th century, the English novel passed through a brief cycle of romance, history and adventure. No decade and perhaps no year since Scott and Dumas had been without an historical novel or a story of adventure. In recent years Blackmore's *'Lorna Doone'* had been received with delight by a wide public; and Shorthouse's *'John Inglesant,'* a spiritual romance of singular beauty, had met with almost equal favor. But the novelist who revived history and adventure as a fashion was Stevenson. He became for his time a lesser Scott, though, in technical detail, he surpassed his countryman. Beginning with *'Treasure Island,'* a story of pure adventure, he passed on through the ethical parable of *'Dr. Jekyll and Mr. Hyde'* to *'Kidnapped,'* *'David Balfour,'* and the *'Master of Ballantrae,'* which were tales of adventure in an historical background after the style of Dumas. These and other tales and short stories, admirable in form and style, and revealing a charming personality, won the hearts of the critics as well as of the larger public. As in the case of Scott, Stevenson was accompanied and followed by scores of historians, among whom were Conan Doyle, S. R. Crockett, Stanley Weyman, Anthony Hope Hawkins, Weir Mitchell, Mary Johnston, Gertrude Atherton and Winston Churchill. Most of this work, though there are exceptions, is mechanical in execution and is destined to pass quickly into oblivion. But Maurice Hewlett es-

pecially has made an interesting psychological study of Mary Queen of Scots under the title of the 'Queen's Quair'; and in the 'Forest Lovers,' 'Little Novels of Italy,' and 'New Canterbury Tales,' he has revived in his own beautiful way the spirit of the Renaissance and the Middle Age.

No less interesting than the recrudescence of romance was the exploitation of remote districts and countries for fresh material, until the earth has now become well-nigh exhausted. First of all comes to mind Kipling, who revealed India in tales of wonderful vigor and insight, like those in collections named 'Soldiers Three,' 'Phantom Rickshaw and Other Tales,' 'Many Inventions,' and in 'Kim,' a longer novel, while his 'Jungle Books' gave rise to an extensive animal literature. Conrad carried the novel to the Malay Peninsula; and Hornung to Australia. Hichens described an oasis in the Sahara and the road to Timbuctoo. Coming nearer home, Barrie and Watson discovered the humor and pathos of the peasantry of Scotland. In the United States, the novel of provincial character was long practised by Mary Wilkins Freeman, Sarah Orne Jewett, Mary Murfree, Bret Harte, G. W. Cable, T. N. Page, Hopkinson Smith, Booth Tarkington, and scores of others. Owen Wister and Hamlin Garland invaded the northwest, and Elizabeth Robins Parkes wrote of the Klondike. Throughout the long period Mark Twain was the supreme humorist. This kind of novel, aiming at local color, still maintains its immense popularity.

The 20th century opened with a remarkable vogue of the short-story, so well adapted to the newspaper and magazine. Short narratives in prose have been cultivated from the earliest times. Egypt and India had them long before the dawn of modern civilization. As *novelle* they were brought to high finish by Boccaccio, and ever since his time they have been frequent in all the literatures of the West. But a new type, depending less upon narrative interest than upon conveying a definite impression or an emotional state, came in with Poe and Hawthorne. Short stories of this kind, containing few characters and shorn of unnecessary incident, were exquisitely wrought by Daudet and Maupassant. Less clean-cut but admirable in their several styles are the short stories of James, Stevenson, Kipling, Hewlett, Aldrich, Davis, Stockton, O. Henry, Edith Wharton and many another writer. Recently supreme excellence has been attained by several Russian novelists—Chekhov, Kuprin, Sologub and Andreev.

Bibliography—Egypt and the East.—The best Egyptian stories were translated into English by Petrie, 'Egyptian Tales' (2 vols. London 1895); and into French by Maspéro, 'Les Contes populaires de l'Égypte ancienne' (Paris 1889). Consult also Warner, 'The World's Best Literature' (New York 1897) for specimens. A concise account of the tales of India is given, with a full bibliography, by Macdonell, 'A History of Sanskrit Literature' (New York 1900); and a more extended account by Schroeder, 'Indiens Literatur und Cultur' (Leipzig 1887). For specimens, consult Jacob, 'Hindoo Tales' (London 1873); Burton, 'Vikram and the Vampire' (new ed. London 1898); and 'World's Best Literature.' The most faithful

translations of the Arabian Nights are by Burton (10 vols., London 1885–86, and six supplemental vols. 1887–88); by Payne (8 vols., London 1882–84), and by Lane, edited by Jacobs (6 vols. London 1898). Burton's translation was abridged by Lady Burton (6 vols. London 1887–88).

Greece.—The standard book on the Greek novel is Rohde, 'Der Griechische Roman' (new ed., Leipzig 1900), of which a summary was made by Schwartz, 'Fünf Vorträge über den Griechischen Roman' (Berlin 1896). Consult also Salverte, 'Le Roman dans la Grèce ancienne'; Dunlop, 'History of Prose Fiction' (rev. ed. London and New York 1888); Warren 'A History of the Novel previous to the 17th Century' (New York 1895). For translations, see the new revisions of Greek and Roman classics in the Loeb Library, the 'Greek Romances' and the 'Golden Ass' of Apuleius in Bohn's Library, and the 'Works of Lucian' translated by Fowler (Oxford 1905).

England.—Cross, 'Development of the English Novel,' a summary of English fiction from mediæval romance to Kipling (new ed. New York 1905); which should be supplemented for contemporary writers by Phelps, 'Essays on Modern Novelists' (New York 1910), and 'The Advance of the English Novel' (New York 1916). Dunlop, 'History of Prose Fiction,' to Scott (rev. ed., London 1888); Raleigh 'The English Novel,' to Scott (New York 1894); Jusserand, the 'English Novel in the Time of Shakespeare' (London 1890); Lanier, 'The English Novel and the Principle of its Development,' from Richardson to Eliot (rev. ed., New York 1897); Stoddard, 'The Evolution of the English Novel,' presenting a theory of development (New York 1900); and Matthews, 'Aspects of Fiction,' of the present day (New York 1896). Besides these general works covering the periods indicated, essays on special aspects of the novel are numerous in the works of Leslie Stephen, Saintsbury, James, Stevenson, Howells and Brander Matthews. The field is well covered by Perry in 'A Study of Prose Fiction' (Boston 1902). Among works of reference may be cited Baker, 'A Descriptive Guide to the Best Fiction' (London 1903); Nield, 'A Guide to the Best Historical Novels and Tales' (3d ed., New York 1903), and Dixon, 'Subject Index to Universal Prose Fiction' (New York 1897).

Spain.—For the Spanish novel as a whole, consult Ticknor, 'History of Spanish Literature' (4th ed., Boston 1871), and for a brief summary Clarke, 'Spanish Literature' (London 1893). The picaresque novels are described by Chandler, 'Romances of Roguery' (New York 1899); and by De Haan in 'An Outline of the History of the Novella Picaresca in Spain' (The Hague and New York 1903). Consult also Dunlop and Warren as cited above.

France.—Paris, 'La Littérature Française au Moyen Âge,' for mediæval types (2d ed., Paris 1890); for 17th century, Körting, 'Geschichte des Französischen Romans in XVII Jahrhundert' (Leipzig 1885–87), and Breton, 'Le Roman au dix-septième Siècle' (Paris 1890); for the 18th century, Waldberg, 'Der Empfindsame Roman in Frankreich' (Strassburg 1906); and for the last century, Gilbert, 'Le Roman en France pendant le XIX Siècle'

(rev. ed., Paris 1896); Wells, 'A Century of French Fiction' (New York 1898); and Brunetiere, 'Le Roman Naturaliste' (New ed., Paris 1892). In various essays Brunetiere has covered nearly the whole field from the beginning of the 18th century.

Germany.—Mielke, 'Der Deutsche Roman des XIX Jahrhunderts' (Braunschweig 1890); Rehorn, 'Der Deutsche Roman' (Köln und Leipzig 1890); and Spielhagen, 'Beiträge zur Theorie und Technik des Romans' (Leipzig 1883).

Russia.—The great body of Russian fiction, along with biographies of the authors, is becoming more and more known through numerous translations. Consult W. L. Phelps, 'Essays on Russian Novelists' (New York 1911) for an excellent guide. See also the articles on individual novelists in this encyclopedia.

The Short Story.—Specimens of tales and short stories from the Egyptian survivals to the present day are given by Jessup and Canby, with an introductory essay on the *genre*, in 'The Book of the Short Story' (New York 1903). The best collection of British and American short stories is Sherman's 'A Book of Short Stories' (New York 1914), which contains a very fine essay by the editor. The art of the short-story has been admirably treated also by Matthews in 'Philosophy of the Short-Story,' in 'Pen and Ink' (New York 1888) and by Perry in 'A Study of Prose Fiction' (Boston 1902). Among other interesting books consult Barrett, 'Short Story Writing' (New York 1900); Esenwein, 'Writing the Short Story' (New York 1909); Grabo, 'The Art of the Short Story' (New York 1914); Hamilton, 'The Materials and Methods of Fiction' (New York 1908); and Pitkin, 'The Art and the Business of Story Writing' (New York 1912). Phelps, W. L., 'The Advance of the English Novel' (1906).

Further information on the novel may be gained by consulting the articles in this encyclopedia on the various literatures and on the leading writers mentioned in this essay.

WILBUR L. CROSS,

Professor of English, Yale University.

NOVEL CONSTITUTIONS, or NOVELS, *in law*, were the supplementary constitutions of some Roman emperors, and especially those of Justinian, so called because they appeared after the authentic publications of law made by such emperors. The Novel Constitutions (also called Novels), together with the Institute, Digest and Code, constitute the whole body of law which passes under the name of Justinian. Although no official compilation of the Novellæ was made they were preserved in several private collections, the most important of which, the 'Liber Authenticorum' was incorporated, in the 12th century, in the 'Corpus Juris Civilis' with the other Justinian codes. Consult Sohm, R., 'The Institutes' (Oxford 1901, trans. by J. C. Ledlie).

NOVELETTE, (1) *in music*, a term denoting certain compositions in free form, characterized by a great number of short themes introduced without regular succession. Schumann (q.v.) was the inventor of this composition. (2) An abbreviated novel, or short work of fiction. A short story usually contains from

1,000 to 20,000 words; a novelette from 20,000 to 40,000 and a novel from 40,000 words upward.

NOVELLINO, *nō-vě-l'ě-nō*, **II, or CEN-TO NOVELLE ANTICHE**, a 13th century collection of Italian stories of a very multifarious character taken from every possible source, biblical, classical, chivalrous and historical. The style is simple and natural and often distinguished by a charming naïveté. The tales were gathered from various sources. Early Latin collections, oral traditions, folk-tales, books of chivalry, the French fabliaux all contributed to them. Consult Gualteruzzi, 'Novellino' (Bologna 1525); Colombo, Michele, 'Novellino' (Milan 1825); other editions by Carbone (Florence 1868); and by Donin (Turin 1890); Biagi, 'Le Novelle Antiche' (Florence 1880).

NOVELLO, VINCENT, English composer: b. London, England, 6 Sept. 1781; d. Nice, France, 9 Aug. 1861. He was one of the founders of the Philharmonic Society of London and of Novello, Ewer and Company, London music publishers. His contributions to cathedral music are numerous and valuable, and in editing the unpublished compositions of great musicians he accomplished an important work.

NOVEMBER (from *novem*, nine), the eleventh month of our year and the ninth month of the Roman year when it consisted of 10 months. It has 30 days, and in Great Britain is generally regarded as perhaps the gloomiest period of the year. The first day of the month is All Saints Day. (See CALENDAR). In the United States Thanksgiving Day comes in November.

NOVGOROD, or VELIKI-NOVGOROD, *vě-l'ě-kě nōv'gō-rōt* ("Great Novgorod"), Russia, (1) a town, capital of the government of Novgorod, on the Volkhoff, near the point where it issues from Lake Ilmen, 103 miles southeast of Petrograd. It is divided by the river into two parts, which communicate by a stone bridge. The portion of the town on the right bank contains in its centre the Kremlin or citadel. Within it is the cathedral of Saint Sophia, built after the model of Saint Sophia at Constantinople; and numerous churches and several monasteries. The town-hall, post office and commercial building stand on the left bank of the river. The manufactures are of little importance and consist of sail cloth, leather, tobacco, candles, vinegar, etc. The trade in corn, flax and hemp, carried on chiefly with the capital, is considerable. Novgorod was in early times the capital of an independent state. So great was its power and wealth that it excited the jealousy of the Muscovite princes, and in 1478 the Tsar Ivan III nearly destroyed the city, deprived it of its liberties and banished its most influential citizens. On the opening of Archangel to English traders, but more especially after the founding of Saint Petersburg, the town rapidly declined. Pop. 27,130. (2) The government of Novgorod has an area of 47,236 square miles. Pop. 2,200,000, chiefly engaged in agriculture and stock-raising. Consult Kluchevsky, V. O., 'History of Russia' (3 vols., London 1911-13).

NOVGOROD-SYEVERSK, *syā'vērsk*, Russia, city on the Desna River, 148 miles northeast of Tchernigov, in the government

of Tchernigov. It is one of the oldest towns in Russia. In the 11th century it was the capital of an independent principality. Subsequently it was annexed to Lithuania. Novgorod-Syevsk possesses an Orthodox Cathedral, dating from 1671; an ancient monastery; and a college, dating from 1808. Novgorod-Syevsk is a brisk trade centre. It manufactures soap, bricks and has tanneries and tobacco and sugar plantations. Pop. 12,727.

NOVI LIGURE, nō'vê lē'goo-rā, Italy, town in the province of Alessandria, 33 miles northwest of Genoa and 13 miles southeast of Alessandria. The town has several churches, a museum, public library, a lyceum and technical schools. The chief industry is the culture and manufacture of silk. Woolen goods are also made here. Novi was the scene of a battle (15 Aug. 1799), when the French were defeated by the Austrians and Russians and General Joubert was killed. Pop. 20,000.

NOVIBAZAR, nō'vê-bā-zār, or **NOVI-PAZAR** (Yenibazar), Jugo-slavia, the capital of the district of Novibazar, Kossovo, on the Rashka, 130 miles southeast of Bosna-Serai. There are no public buildings worthy of notice except the ruined citadel. It is the chief point of communication between Bosnia and Serbia; several of the chief roads of the country cross each other here. By the terms of the Treaty of Berlin of July 1878, the liva or district of Novi-bazar was maintained under a dual Austro-Turkish control. The town was given to Serbia by the treaties of London 30 May 1913. Pop. about 14,000.

NOVICE. See NEOPHYTE.

NOVIKH, nō'vêk, **Gregor** ("Rasputin"), Russian lay monk: b. Tobolsk, Siberia, 1873; d. Petrograd, 29 Dec. 1917. He came of a peasant family with some hereditary gift of mesmerism. Known in youth as a dissolute character, he was given the sobriquet of Rasputin (q.v.). At 30 he became religious and although never in religious orders, his fame as an ascetic grew, and the dignitaries of the Church favorably regarded him as one who might prove a popular "miracle worker." Though he never changed his immoral life, his reputation extended first in Moscow and from 1900 in Petrograd, among the highest circles of society. He started a new cult, in which dancing and debauchery were interspersed with mystical séances. He was introduced at the Imperial Court, where he exerted a powerful influence for years. In 1915 he published some details of his amours in the *Novoye Vremya* and was shortly after banished to his native Tobolsk. He was allowed to return in 1914; in July he was stabbed in the street by a peasant woman who wished to avenge one of his victims. The secret of his popularity at court, where he held the office of "Lighter of the Sacred Lamps," was stated to be due to an alleged miracle he had performed in restoring the young ex-tsarevitch, Alexis, to health. M. Gutchkoff (q.v.) denounced Rasputin in the Duma in 1912 as "a mysterious tragi-comic figure, an apparition of the Dark Ages." Both the ex-tsar and his consort were frequently exhorted to expel the sinister monk from the court. All efforts to remove him failed and criticism of his actions were forbidden by the censorship. The scandal grew to such dimen-

sions that the nobility—including grand-dukes and princes of the royal blood desired to remove what they called a "plague spot" from the national life. He grew frightened and shut himself up in his house, surrounded by a private bodyguard and secret police. On the night of 29 Dec. 1917 Prince Yussupoff, a young graduate of Oxford and married to a connection of the Imperial family, invited Rasputin by telephone to his palace to a supper party. Rasputin, taken off his guard, entered the waiting automobile of his host and was driven to the Yussupoff palace on the Moika Canal. Here he was shot by the young prince in the presence of a grand-duke, a former Minister of State and several members of the Duma. The body was dropped into the Neva through a hole in the ice. It was recovered three days later, taken to Tsarskoe-Selo and buried in a silver casket.

NOVIKOFF, nōv'ikōf, **Nikolai Ivanovitch**, Russian author: b. near Moscow, Russia, 27 April 1744; d. there, 30 July 1818. He entered the Imperial service, but soon turned his attention to literature and became editor of the *Moscow Gazette* (1779-89). He established in Moscow a Typographical Society, whose purpose was to further inexpensive reprints of valuable books, and he also founded there the first circulating library in Russia, and in many various ways endeavored to promote the cause of education. In the *Drone* (1769-70) and the *Painter* (1772-73) he fought for the liberation of the Russian slaves and ridiculed the passion then shown by the upper class for everything French. Both periodicals were stopped by order of the court. He was imprisoned (1792) for writing 'A History of the Jesuits,' and his property was confiscated, and his hospitals, schools, libraries and bookstores closed. His other works include 'The Painter'; 'Russian Biographies,' etc. Consult Gretch, 'Essai sur l'Histoire de la Littérature Russe,' also Luginnoff, 'Novikoff and the Moscow Martinists' (1897).

NOVIKOFF, **Olga Kiréeff** ("O. K."), Russian political writer: b. Moscow, 1840. Her parents belonged to the nobility, and at 19 she was married to General Novikoff. She removed to England and there found friends among the most eminent statesmen of the day. Her political writings, signed "O. K.," aimed to further an Anglo-Russian alliance and continued the work of her brother who was killed in the Turkish War. She has published 'Is Russia Wrong?' (1877); 'Friends or Foes' (1878); 'Skobelev and the Slavonic Cause' (1884) Consult Stead, W. T., 'The M. P. for Russia: Reminiscences and Correspondence of Madame Olga Novikoff' (New York 1909).

NOVO CHERKASK, nō'vō chër-kās'kā, or **TCHERKASH**, Russia, city, capital of the province of the Don Cossacks, near the Don River, about 40 miles from its entrance into an arm of the Sea of Azof. Anthracite coal mines and rich farm lands are in the vicinity. Two large fairs are held here each year, which bring considerable trade to the city. It has a number of manufacturing establishments, several excellent schools and a large library. Brewing was the chief industry of the city up to 1914. Pop. 68,200.

NOVOGEORGIEVSK, nō'vō-gē-ōr'gē-yěfsk, Poland, fortress on the Bug and Vistula rivers, nine miles northwest of Warsaw. This spot was fortified by Charles XII of Sweden and the fortifications were extended by Napoleon. It was captured by the Russians in 1813 and occupied by the Poles in 1830 during their insurrection. One of its names is the "Polish Quadrilateral." The Poles also call the fortress Modlin, because it stands on the site of an ancient town of that name. The fortress is built on the banks of the Bug and the Vistula. The Germans captured Novogeorgievsk early in the World War.

NOVOROSSISK, nō'vō-rōs-sēs'k', Russia, city on the Black Sea, in the government of Tchernomorsk, Caucasus, 60 miles south of Ekaterinodar by rail. A fortress was erected here by the Turks in 1722 and in 1838 Novorossisk was built. The English and French bombarded it in 1855. Novorossisk, situated on a large bay, is the chief outlet for the North Caucasus district. A large mole protects the harbor. North of the bay, in Novi Gorod, are the Russian Standard Petroleum Works and a large grain elevator. Grain and naphtha constitute the chief industries. There are also iron foundries and cement works. Novorossisk exports barley, wheat, linseed, wool, kerosene, oil cake and cement. Pop. 61,200.

NOVUM ORGANUM (literally, new method or instrument), a famous work by Francis Bacon, published in 1620. It forms the second part of Bacon's philosophical work entitled 'Instauratio Magna,' 'The Great Restoration' of Sciences. The first part, 'De Augmentis Scientiarum,' is an extension of the previous work on the 'Advancement of Learning.' The third is the 'Historia Naturalis.' The 'Novum Organum' contains the outlines of the scientific or inductive method; namely, that of proceeding from facts to general laws, instead of inferring facts from assumed general principles which have never been proved. This latter, the philosophical and metaphysical method, was repudiated by Bacon and, together with the "superstitions" of theology, was declared to have no place in the new learning. 'The New Method,' therefore, is an attempt at an interpretation of nature from direct observation.

NOVY, nō'vī, Frederick George, chemist and bacteriologist: b. Chicago, Ill., 9 Dec. 1864. He was graduated from the University of Michigan in 1886 and studied in Berlin. In 1891 he became assistant professor at the University of Michigan and was several times promoted until in 1902 he was made professor of bacteriology. He was at Pasteur Institute in Paris in 1897 for the prosecution of his studies and in 1901 he formed one of the United States commission to investigate the plague in San Francisco. He is a member of many scientific societies, domestic and foreign, and is the author of 'Cocaine and Its Derivatives' (1887); 'Laboratory Work in Physiological Chemistry' (1893); 'Laboratory Work in Bacteriology' (1899) and several books in collaboration. He has also published results of many researches in physiological chemistry, bacteriology and proto-zoology.

NOWANAGAR, nō-wā-na-gār', or **NA-WANUGGUR**, na-wā-nū-gūr', India, the sea-

port capital of a native Gujarat state of the same name in the Kathiawar peninsula, at the mouth of the Nagna, on the Gulf of Cutch, 54 miles east of Rajkot, with which it is connected by a branch railway line. It is noted for its textile manufactures, pearl fisheries and carries on an active export and import trade and has extensive coastwise and inland trade. The town is encircled by a very strong ancient wall over four miles long. Pop. 44,887.

NOWATA, nō-wā'ta, Okla., city and county-seat of Nowata County, on the Saint Louis, Iron Mountain and Southeastern and on the Missouri Pacific railroads, 23 miles south of Coffeyville, Kan., and 32 miles northwest of Wagoner. Nowata is situated in a region rich in natural gas and oil-wells. Apart from this source of income the industries are farming and stock-raising. The city owns its waterworks. Pop. (1920) 4,471.

NOWELL, nō'ēl, Increase, Anglo-American colonist: b. in England, 1590; d. Boston, 1 Nov. 1655. One of the original patentees of the Massachusetts Bay Company, in 1630 he came to New England with John Winthrop. About 1632 he was dismissed from Boston because of his urging the separation of Church and State; and became one of the founders of Charlestown and ruling elder in the church. He was outlawed by the English authorities for failure to appear before them. Nowell was secretary of the colony (1644-49), treasurer of Harvard College and chaplain to the force sent against the Narragansett Indians. He died in poverty, but a large land grant in New Hampshire was voted by the colony to his widow and his son, Samuel (1634-88), who had distinguished himself in the swamp fight with the Narragansetts.

NOX. See **Nyx**

NOYADES, nwā-yād, in French history, the name given to the execution of political offenders by drowning them, practised during the Revolution, especially during the Reign of Terror, by Carrier at Nantes. The method adopted was crowding the victims into a boat, withdrawing a plug in the bottom and casting them adrift. See **CARRIER**, **JEAN BAPTISTE**.

NOYAU, or **CRÊME DE NOYAU**, nwō'yō', a French liqueur prepared from white brandy, bitter almonds, sugar-candy, grated nutmeg and mace and sometimes flavored with the kernels of apricots, peaches, the peel of oranges, etc.

NOYES, noiz, Alfred, English poet: b. Staffordshire, England, 16 Sept. 1880. He was educated at Exeter College, Oxford, where he gave evidence of his fine taste for literature. In 1913 he came to the United States to deliver a course of lectures at the Lowell Institute, Boston, choosing for his subject "The Sea in English Poetry." Yale gave him the degree of LL.D. in that year. In 1915 he became professor of English literature at Princeton University. He has contributed verse to the leading magazines of England and the United States. His books are published in London and New York. They include 'The Loom of Years' (1902); 'The Flower of Old Japan'; a tale in verse (1903); 'Poems' (1904); 'The Forest of Wild Thyme' (1905); 'Drake, an English Epic' (1908); 'Forty Singing Sea-

men' (1907); 'The Enchanted Island and Other Poems' (1909); 'Collected Poems' (2 vols., 1910); five volumes in America with additional poems (1911); 'Robin Hood' (1912); 'Tales of the Mermaid Tavern' (1912); 'The Winepress, a Tale of War' (1914); 'Roda' (1915); 'A Salute from the Fleet' (1915); 'The New Morning' (1919). In addition he has also published a volume of essays—'The Sea in English Poetry' (1913); a 'Life of William Morris' (in the 'English Men of Letters Series,' 1908); and edited 'The Magic Casement and Minstrelsy of the Scottish Border' (1908); 'A Book of Princeton Verse' (1916); 'The New Morning' (1919).

NOYES, Arthur Amos, American chemist: b. Newburyport, Mass., 13 Sept. 1866. He received the degrees of S.B. in 1886 and of S.M. in 1887 at the Massachusetts Institute of Technology and of Ph.D. at Leipzig University in 1890. At the Massachusetts Institute of Technology he was instructor in analytical chemistry from 1890–94; assistant professor of organic chemistry from 1894–97; associate professor from 1897–99; professor of theoretical chemistry from 1899; and director of the research laboratory of physical chemistry from 1903. He was acting president of that institute from 1907–09. He has received honorary degrees of LL.D. from Maine University, 1908; LL.D. from Clark University, 1909; Sc.D. from Harvard University in 1909; Sc.D. from Yale University in 1912; and LL.D. from Pittsburgh University in 1915. He was president of the American Chemical Society in 1904. He is author of 'A Detailed Course of Qualitative Chemical Analysis of Inorganic Substances' (1895); 'Class Reactions and Identification of Organic Substances' (1899); 'General Principles of Physical Science' (1902); 'The Electrical Conductivity of Aqueous Solutions' (1907); 'General Principles of Chemistry' (1916); also of numerous papers on researches in physical, analytical and organic chemistry and on educational topics.

NOYES, Frank Brett, American journalist: b. Washington, D. C., 7 July 1863. He is the son of Crosby Stuart Noyes (1825–1908), a well-known American journalist and was educated in the public schools of his native city and the preparatory department of Columbian College (now George Washington University). From 1881 to 1901 he was manager of the *Washington Star* and in 1902–1909 was editor of the *Chicago Record-Herald*. Since 1910 Mr. Noyes has been president of the Evening Star Newspaper Company in Washington. In 1894 he was made a director of the Associated Press, of which he became president in 1900.

NOYES, Henry Drury, American eye-specialist: b. New York City, 1832; d. 1900. He was graduated at New York University in 1851 and at the College of Physicians and Surgeons in 1855. From 1868 to 1900 he was professor of otology and ophthalmology in Bellevue Hospital Medical College. He was one of the founders of the American Ophthalmological Society in 1864 and was its president from 1878 to 1884. His published works include 'A Treatise on Diseases of the Eye' (1881); 'A Text Book on Diseases of the Eye' (1890; 2d ed., 1894).

NOYES, John Humphrey, American author and founder of the Oneida Community (q.v.): b. Brattleboro, Vt., 6 Sept. 1811; d. Niagara Falls, Canada, 13 April 1886. His father was a representative in Congress 1815–17 and his mother an aunt of President R. B. Hayes (q.v.). He studied at Dartmouth, took theological courses at Andover and Yale, was licensed to preach as a Congregational minister in 1833. He soon lost this license, having professed a second conversion, a belief in the dual sexual nature of God and the doctrine that the Christian is bound by no rule of duty or conduct. With these tenets and an attempted return to the communism of the primitive Church, he gathered round him a Perfectionist Community at Putney, Vt., whose practice of complex marriage forced them to migrate to Oneida, N. Y. But there, too, they outraged public sentiment, so that they gave up their peculiar tenets in 1880 and Noyes and some of his adherents moved to Canada. He wrote 'The Berean,' which may be called the 'Bible of the Oneida Community' (1847; 'Communism' (1848); 'The Second Coming of Christ,' that is in 70 A.D. (1859); 'Salvation from Sin' (1869); and 'History of American Socialism' (1870). See ONEIDA COMMUNITY.

NOYES, Walter Chadwick, American lawyer: b. Lyme, Conn., 8 Aug. 1865. He was educated at Cornell University and was admitted to the bar in 1886. From 1895 to 1907 he was judge of the Court of Common Pleas of New London, Conn., and from 1907 to 1913 was United States circuit judge of the second circuit. In 1913 he removed to New York to practise in that city and in 1915 he was appointed receiver of the Chicago, Rock Island and Pacific Railroad. He became general counsel for the Delaware and Hudson Company and engaged in general practice in New York. In 1909 and 1910 he was United States delegate to the International Conference on Maritime Law in Brussels. He is author of the 'Law of Inter-Corporate Relations' (1902) and the 'American Railroad Rates' (1905).

NOYES, Willam Albert, chemist: b. near Independence, Iowa, 6 Nov. 1857. He was graduated at Iowa (now Grinnell) College in 1879, from Johns Hopkins University (Ph.D.) in 1882. Received the degree of LL.D. from Clark University in 1909. He was professor of chemistry in the University of Tennessee, 1883–86, in the Rose Polytechnic at Terre Haute, 1886–1903 and chief chemist of the Bureau of Standards, 1903–07. Since 1907 he has been professor of chemistry and director of the chemical laboratory of the University of Illinois at Urbana, Illinois. He is a member of the National Academy of Sciences and has been editor of the *Journal of the American Chemical Society* since 1902. He organized and edited *Chemical Abstracts*, 1907–09 and is the author of 'Elements of Qualitative Analysis' (1887; 6th ed., 1911); 'Organic Chemistry for the Laboratory' (1897); 'Organic Chemistry' (1903); 'Kurztes Lehrbuch der organischen Chemie' (1907); and 'Text-book of Chemistry' (1913); also of many scientific papers.

NOYES, William Curtis, American lawyer: b. Schodack, N. Y., 19 Aug. 1805; d. New York, 25 Dec. 1864. He was admitted to the bar in

1827, was appointed district-attorney of Oneida County, and later established a law practice in New York, 1838. He was one of the strongest advocates at the New York bar, and earned a reputation for highest integrity. At the time of his death was engaged in codifying the laws of the State, a work begun in 1857. In 1861 he was a member of the Peace Convention, held in Washington previous to the outbreak of the Civil War, where he strove to maintain the Union. He willed his extensive law library to Hamilton College, Clinton, N. Y.

NOYON, nwä'yôn', France, city in the Department of the Oise, 67 miles north of Paris on the railway to Brussels. Noyon suffered greatly during the European War. It is a town full of historic interest, built on the slopes and at the foot of a hill and on a small stream the Verse, which flows into the Oise about a mile distant from Noyon. Noyon was a military post in Caesar's time. Three famous councils were held here—in 814, in 1233 and in 1344. Noyon was the birthplace of John Calvin in 1509. Noyon was until the devastations of the War of 1914-18 full of antiquarian and architectural interest. Among these were remains of an old Roman wall and a beautiful statue of Apollon Gaulois, or Belenus, discovered in 1856 in the wood near the Mont de Choisy. The cathedral of Notre-Dame, which was begun after the original church was burned in 1131, was a fine example of the transition from Romanesque to Gothic. Until the European War the principal industries were sugar-refining, oil refining, beer, chemicals, tanneries, iron-foundries, manure works, lace, linen and tulle, leather and cloth. Pop. 7,300. Consult A-Le-franc, 'Histoire de Noyon jusqu'à la fin du XIII Siècle' (Paris 1887).

NU, noo, or **NUU**, or **NÛN**, was the Egyptian deity who represented the primeval waters out of which sprang the sun-god Râ, "while as yet there was no heaven and neither serpent nor reptile was formed" Nu "gave birth to himself and made his name to come into being" reads the old Egyptian text. Out of the bosom of Nu sprang all the primeval gods of Egypt; and these gods are the names of his limbs—Later Râ, Temu and Nu became identified as one supernatural being; and Râ takes to himself the attributes of all the other gods who sprang from Nu. Thus in Chapter XLII of the Book of the Dead Râ says of himself: "My hair is the hair of Nu; My face is the face of Disk; My eyes are the eyes of Hathor; My ears are the ears of Apuat," etc., throughout a long list which includes every member of the human body. In the Egyptian as in the Christian religion, God the Son assumes all the attributes and functions of God the Father. It was in the presence of Râ, the father god, that Nu created the other gods out of his own being. Consult Breasted, J. H., 'Development of Religion and Thought in Ancient Egypt' (New York 1912); Budge, E. A. W., 'Egyptian Ideas of the Future Life' (London 1908); 'The Gods of the Egyptians' (1904); Wiedmann, A., 'Religion of the Ancient Egyptians' (Vol. I, London 1904).

NUBA, noo'bä, an ethnological name given to the negro tribes of Kordofan, in Eastern Sudan, whence they spread into Dafur and Wadai. They are divided into two distinct

groups, the Nubas proper, in central and southern Kordofan; and the Nilotic Nubas. The Nubas are true negroes. Consult Müller, F., 'Algemeine Ethnographie' (Vienna 1879); Stanford, 'Africa' (1895).

NUBAR PASHA, noo'bär päsh'ä, Egyptian statesman: b. Smyrna, January 1825; d. Paris, 14 Jan. 1899. An Armenian Christian, he was educated in Switzerland and France; in 1842 he became secretary to Boghos Bey, Egyptian Minister of Commerce and Foreign Affairs. He later rose to be bey, and was sent on important diplomatic missions. Under Said Pasha he was in charge of the transport service through Egypt to India, and built the railway across the desert from Cairo, to Suez. After the accession of Ismail Pasha, who at first strongly relied upon him, he was Egypt's first Minister of Public Works, and from 1866 Minister of Foreign Affairs. He successfully concluded at Constantinople and Paris the negotiations toward the construction of the Suez Canal, obtained for Ismail the title of khedive, and strove to introduce European culture and methods of administration. At that time in Egypt the consulates of 17 various powers administered as many different codes of law, and to these courts alone the subjects of the said powers were amenable. Nubar prevailed upon the powers to allow the organization of international courts with a uniform code, perhaps his greatest achievement. He was dismissed in 1874, but on demand of the powers was at the head of the ministry in 1878-79, directing the financial reforms. In 1884-88 and 1894-95 he was again Premier. He was very adaptable, not to say pliant, and readily became the administrator of a British policy of which he did not approve.

NUBIA, nü'bī-ä, Africa, a comparatively modern name for a large region, formerly a portion of Ethiopia, and extending on both sides of the Nile from Egypt to Abyssinia; touching the Red Sea on the east and the desert on the west. Nubia proper, or Lower Nubia, extends from Assuan on the Egyptian frontier to Dongola; beyond that is Upper Nubia. But of late the name of Egyptian Sudan, properly applicable to a section of Upper Nubia, has come to be used for Nubia in its widest sense, together with the once Egyptian territory actually in the Sudan, and the equatorial provinces. The great Nubian Desert lies east of the Nile, opposite the great west bend of the river. See EGYPT; SUDAN.

NUBLÉ, nüo'blä, Chile, an inland province, bounded on the north by Linares, on the east by Argentina, on the south and west by Concepcion; area, 3,407 square miles. It is an agricultural region in which the chief product is wheat, and considerable attention is given to raising cattle. Pop. 210,000. Capital, Chillan.

NUCLEIN, nü'klē-in, from the Latin *nucleus*, a kernel, is the principal constituent of cell-nuclei, or the complex chemical substance termed also chromatin by virtue of which a cell grows, develops and reproduces. It is most abundant in white blood corpuscles. Nucleinic acid is an organic acid rich in phosphorus. From blood serum a nuclein or nucleinic acid, may be separated. Consult Allbutt's 'System of Medicine' (1896). See CELL; CYTOLOGY.

NUCLEUS. See CYTOLOGY.

NUDDEA, nūd'ē-ā. See **NADIA**.

NUDIBRANCHIATA, nū'di-brān'ki-ā'ta, one of the two primary divisions (orders or sub-orders) of the opistho-branchiate gastropods (q.v.). The name is in allusion to the absence of the primary gills or ctenidia, which in mollusks occur typically within the mantle cavity, and the functional substitution for them of external processes or cerata which perforate the mantle when the latter is present. The cerata differ greatly in form and arrangement and their peculiarities characterize the different families. They may be retractile or not; armed with stinging cells or without them; simple, pronged or arborescently branched, in the latter case usually penetrated by portions of the complexly ramifying liver. In their arrangement they may form dorsal or lateral rows, or a circle about the anus. Frequently they are most beautifully colored, and in many cases closely resemble the object on which the animal lives. The young are provided with a nautiloid shell, which is lost early in life, leaving the adult devoid of this protection. A mantle may or may not persist, and the integuments are frequently filled with calcareous spicules. On the head are found a pair of minute sessile eyes, and a pair of often retractile tentacles, which are olfactory in function and are known as rhinophores; in addition to which there may be a second pair of tractile tentacles. The mouth is provided with a radula and sometimes with jaws. Because of the usually elongated form of the body and their strictly marine habit, the nudibranches are known popularly as "sea-slugs." With the exception of a few free-swimming, pelagic and parasitic forms, the vast majority of the species belong to the littoral zone, where they creep upon algæ, hydroids, polyzoans and similar organisms, which afford them concealment and a place to attach the gelatinous capsules in which the eggs are deposited, besides furnishing the animal or vegetable food on which the particular species subsists. Most, if not all, of them are hermaphrodites. Upward of 1,000 species have been described and arranged in 17 families. On the Atlantic Coast of the United States 21 genera and 33 species occur in the region north of Cape Hatteras.

NUECES, nwā'sēs, a river in Texas which rises in a ridge of low mountains in Edwards County and flows south into Dimmit County, then east, northeast and southeast into Corpus Christi Bay. It formerly marked the boundary of the province of Texas in Mexico. It is about 400 miles long and navigable only a short distance from the Gulf. It drains an area of about 19,000 square miles and there are many irrigation plants along it, especially in its watershed in Edwards County.

NUELSEN, nūl'zēn, **John Louis**, American Methodist Episcopal bishop: b. Zurich, Switzerland, 19 Jan. 1867. He received his education in Germany and came to the United States in 1886. He was ordained a Methodist Episcopal minister in 1889 and was given a church in Sedalia, Mo. In 1890 he graduated at the Drew Theological Seminary (Madison, N. J.) and in 1892 took the degree of M.A. in the Central Wesleyan College. In 1890-92 he was professor of ancient languages in Saint Paul's College, Minnesota, and in 1892-93 he

studied in the universities of Berlin and Halle. From 1894 to 1899 he was professor of exegetical theology in the Central Wesleyan Seminary, Warrenton, Mo., and in 1899-1908 he was professor in the Nast Theological Seminary, Berea, Ohio, where he edited the *Deutsch-Amerikanische Zeitschrift für Theologie und Kirche*. In 1908 he became bishop of the Methodist Episcopal Church. In 1912 he was placed in charge of all Methodist Episcopal work in Continental Europe with Zurich as his headquarters. He has written for encyclopædias on theology and is associate editor of the International Standard Bible Encyclopædia (Washington, D. C.). His books include 'Die Bedeutung des Evangeliums Johannes' (1903); 'Das Leben Jesu in Wortlaut der vier Evangelien' (1904); 'John Wesley, ausgewählte Predigten' (1905); 'Luther the Leader' (1906); 'Kurtzgefasste Geschichte Methodismus' (1907); 'Recent Phases of German Theology' (1908); 'Methodismus und Weltmission' (1913), and 'Reformation and Methodismus' (Zurich 1917). The University of Denver gave him the degree of D.D. in 1903 and the Nebraska Wesleyan University that of LL.D. in 1910.

NUEVA CACERES, nwā'vā kā'thā-rēs, Philippines, formerly Naga, a pueblo and capital of the province of Ambos Camarines, situated in the southern part of the province on the Naga River at the head of navigation for large vessels, 10 miles inland from San Miguel Bay. It is a port of entry, an important road centre, and has an excellent trade. It is well built, contains a government house, a cathedral episcopal palace, a seminary, hospital, parochial school and a normal school for girls. It was at one time the seat of the episcopal see of the Philippines. Pop. about 20,000.

NUEVA ECIJA, ā'thē-hah, Philippines, a province of central Luzon, having a coast line of 23 miles on the Pacific, and bounded on the north by Pangasinán and Nueva Vizcaya, and on the south by Infanta and Bulacán. The surface is mostly low, but is broken in the northeast and south by foothills of the Cordilleras. The Grande de La Pampanga River crosses the province from north to south, the Canarén tributary of the Agno follows the northwestern boundary, the Pampanga Chico, the southwestern; many smaller rivers are tributary to these. The soil is very rich, the larger rivers frequently overflowing and fertilizing the fields with their deposits. Rice is raised in the southern and central portions; other important products are corn, tobacco, sugar and papay. The chief industry is agriculture; there are some manufactures for home consumption only; sugar is manufactured and refined on the plantations. Cattle are raised in the central part of the province. A road parallels the entire course of the Grande de la Pampanga River. There are numerous other roads, and a large boat traffic along the Pampanga and its tributaries. Civil government was established in Nueva Ecija in June 1901, and at the end of that year the governor reported that the province was "free from insurrectionary movement." Pop. 156,610, mostly Tagalogs and Ilocanos.

NUEVA ESPARTA, ās-pār'tā, Venezuela, a state composed of islands off the northwest coast of the republic. Margarita is the largest island of the group. Nueva Esparta was a part of the state of Guzman Blanco until 1901, when it became a separate state.

NUEVA SAN SALVADOR, sän sāl-vā-dōr, or **SANTA TECLA**, Salvador, Central America, city in a mountainous region a little northwest of the centre of Salvador and about eight miles from the capital. The chief occupation is mining. Pop. about 17,000. See SALVADOR.

NUEVA VIZCAYA, vēth-kā'yā, Philippines, a province of the island of Luzon, situated south of the centre of Northern Luzon, bounded on the east by the province of Isabela and on the west by Pangasinán and Benguet; area, 1,075 square miles. The surface of the province is uneven, being broken by the foothills of the Sierra Madre, the Cordillera Central and the Caraballo range. The Magat tributary of the Grande de Cagayán River crosses the province from northwest to southeast and there are numerous smaller rivers and streams. The only crop raised to any extent is rice; sugar, chocolate and tobacco are also raised, but not in sufficient quantities to supply the inhabitants of the province. Several kinds of building stones, granite, sandstone, etc., are found in the mountains, but quarried only to a small extent; there are also valuable forests containing resin and gum trees, but these products are not gathered on account of the difficulty of transportation. A few simple fabrics are woven for domestic use. The main highway of Luzon from Manila to Aparri passes through this province, but there is but little traffic on account of the difficulty of reaching the interior. Civil government was established for the province in January 1902; and a special form of municipal government organized for a few of the larger towns, which is being extended to other towns as they are prepared for it. Pop. 67,000, mostly non-Christian tribes.

NUEVITAS, nwā-vē'tās, Cuba, seaport in the province of Camagüey, in the northeast part of the province, on the coast and on the railroad which extends 39 miles to Puerto Principe. It has an excellent harbor and a large trade with other seaports of Cuba, the West Indies and the United States. Pop. about 7,000.

NUEVO LAREDO, nwā'vō lā-rā'dō, Mexico, town in the state of Tamaulipas, on the Rio Grande and on the Mexican National Railroad. It is opposite Laredo, Texas, and about 160 miles north by west of Monterey. Nuevo Laredo figured prominently in the revolution which began in Mexico toward the close of 1910 and it was partially burned by the Federals in 1914. It has a customs house and is the seat of a United States consulate. Pop. 9,000.

NUGENT, John F., American legislator: b. LeGrand, Ore., 28 June 1868. He was educated in the public schools of Silver City, Idaho, was admitted to the bar and began the practice of his profession at Silver City in 1898. He served four terms as prosecuting attorney of Owyhee County, Idaho, and two

terms as chairman of the Democratic Central Committee of the same county. He also served two terms as chairman of the Democratic State Central Committee and was appointed United States senator by Governor Moses Alexander, on 22 Jan. 1918, to fill the vacancy caused by the death of James H. Brady.

NUISANCE, *in law*, a term used to denote whatever is a serious disturbance, annoyance or discomfort to one's neighbors, or in a general sense to the public at large, in the exercise of their rights of property. Sometimes the same act may be legally considered both a nuisance and an injury for which damages may be obtained. Nuisances are of two kinds, public or common, and private.

Public nuisances are offenses against the public at large such as annoyances in the highways, bridges and public rivers, by rendering the same difficult or dangerous to pass, either by actual obstructions or by want of repair; injurious and offensive trades and manufactures, which, when hurtful to individuals, are actionable, and when detrimental to public health or convenience, punishable by public prosecution, and subject to fine according to the nature of the offense; keeping hogs in a city; disorderly houses, unlicensed plays, gaming houses and brothels; lotteries; making and selling fireworks in unlicensed places. The storing of petroleum, ammunition, gasoline and explosive material in general is also strictly regulated. From the very nature of it a public nuisance is a criminal offense, and consequently punishable as such by the State. Therefore, as a general rule and principle, the individual must institute proceedings against a public nuisance, not in his own name, but in that of the State, unless he can show that some particular injury has been done or is being done to himself above that suffered by the public in general. The injury must be direct, substantial and consequential.

A private nuisance may be defined as an injury or annoyance to the person or property of an individual. Such an act is not generally a criminal offense. If a person builds a house so near to that of his neighbor that the roof of the new building overhangs that of the other, and throws the water on it, this is a private nuisance, for which an action will lie. But depriving one of a mere matter of pleasure, as of a fine prospect, this, as it abridges nothing really necessary or convenient, is not an injury for which there is legal remedy. To keep hogs near one's house, to carry on any offensive trade, as a tanner, tallow-melter, soap-boiler, or the like, are all nuisances for which an individual has remedy by action, but it is necessary to show that such nuisances are of a character to render serious discomfort to ordinary persons or to sensibly damage property. So also is it a nuisance if life be made uncomfortable by the apprehension of danger, or by employing a steam engine, which produces a continual noise and vibration in the apartments of a neighbor. Besides the remedy by action, injured parties may, in a clear case, take the law into their own hands, and remove or abate the nuisance, but it is never advisable to take this course. But in some cases a nuisance may be legalized by statute. In England the power of the Parliament in this respect is unlimited; but that of the United States Congress is restricted by the

Constitution. In all municipal codes there are elaborate provisions with reference to sewers and drains, the disposal of sewage, scavenging and cleansing, water supply, cellar dwellings and lodging houses, the prevention, abatement, etc., of nuisances, offensive trades, unsound meat, infectious diseases and hospitals, mortuaries, highways and streets, lighting of streets, public pleasure grounds, markets and slaughter houses, police regulations, prosecution of offenses, alteration of areas, etc. The overcrowding of houses may be stopped. Provisions are also made to prevent the spread of diseases in times of epidemics, and common lodging houses from being kept unclean. The inspector of nuisances or the medical officer of health has, at all times, power to inspect any animal, carcass, meat, poultry, game, fish, fruit, vegetables, corn, bread or flour, and if found unfit for food, or diseased or unsound, they may be carried away and destroyed, and the owner or dealer fined. The local authority may order house proprietors to provide proper water closets, to cleanse gutters and cesspools, and to remove any pool, ditch, drain, urinal or privy injurious to health.

The victim of a private nuisance has three remedies open to him: A suit for damages, an injunction and an abatement. If he proves his case he is entitled to nominal damages, in any case; but if, in addition, he prove that he has sustained real material damages or injury, he may secure such damages; and if the defendant has been proven to have acted with malice, he is liable to punitive damages also. An injunction is not always available; and in some States it is often difficult to secure; especially when it can be shown that an injunction would work hardship upon the defendant, other individuals or the public in general. In this case the injured party has still open to him an action for damages. This is the general mode of procedure employed by individuals against incorporated concerns and powerful companies on account of the difficulty of securing an injunction against them. Consult Garrett, E. W., 'Law of Nuisances' (London 1897); Joyce, J. A. and H. C., 'Treatise on the Law Governing Nuisances' (Saint Louis 1906); Pollock, Sir Frederick, 'The Law of Torts' (London 1908); Wood, H. G., 'Law of Nuisances' (San Francisco 1893).

NUIT DE MAI (May Night). The "Nuit de Mai" remains one of the most celebrated and characteristic of de Musset's lyrics. His theory of poetry, in so far as so spontaneous a singer may be said to have held to any theory, was far different from Wordsworth's, for instance. Poetry is not the result of reflection on experience "emotion recollected in tranquillity." It is experience itself. Its excellence depends upon the intensity of the emotion which has thrilled the poet and the sincerity with which he has reproduced it. For this reason de Musset's poetry is not poetry of description or reflection, and his favorite theme was love, since it was the source of life's deepest joys and sorrows. His own emotional life reached its climax when, hardly more than a lad, at 23, he fell passionately in love with George Sand and set out with her on the great flight to Venice. What had begun as a divine adventure, after a brief heyday, ended in heart-break and a long bitterness. This, the cardinal

experience of his life, he recorded after his return to Paris in the 'May Night,' a dialogue between the poet and the muse, his confidant. In it he parallels in almost identical terms the sentiment expressed in Shelley's 'Skylark' — "Our sweetest songs are those that tell of saddest thought."

The high sense of spring's return, of the keenness of youth and genius foiled, the bitterness of lost love, the now ineffectual consolation of poetry, there expressed with wonderfully symphonic, rhythmic power, make of 'Nuit de Mai' the most intense and direct of the romantic love lyrics of France. To have written it one must have been 23, have loved George Sand and have been Alfred de Musset, whose heart strings, like Israel's, "were a lute."

CHRISTIAN GAUSS.

NUKHA, noo'khä, Russia, town in Transcaucasia, about 120 miles east by south of Tiflis and 150 miles northwest of Baku. It is near oil fields and is the industrial and commercial centre of a silk-producing region. The inhabitants are mostly Armenians and Russians. Pop. about 41,804.

NUKUALOFA, noo-koo-ä-lö-fä, Friendly Islands, the capital of Tonga, the largest island of the group. See FRIENDLY ISLANDS.

NULATO, noo-lä'tō, Alaska, native village on the north bank of the Yukon River, above the mouth of the Koyukuk. Nulato has long been the trading station for the natives of this region. A government school and the Roman Catholic mission of Saint Peter Claver are situated here. There is also a telegraph station. Pop. about 300, chiefly natives.

NÜLL, nül, Eward van der, Austrian architect: b. Vienna, 9 Jan. 1812; d. there, 3 April 1868. He was professor of architecture and ornamentation in the Vienna Academy, and a prominent practising architect. Most of his designs were executed with August von Siccardsburg. These include the Larisch palace and the Opera, at Vienna, 1861-69. Nüll's style was largely Renaissance, inclining to late Renaissance and rococo, and he exercised a decided influence on the architectural development of Vienna.

NULLA BONA (no goods), the name of the return made by the sheriff to a writ of execution, when he has not found any goods of the defendant within his jurisdiction on which he could levy. The sheriff must, however, use all reasonable means to find the goods of the debtor. If the sheriff should give a false report, he is liable for the value of the goods he should have seized. See ATTACHMENT; EXECUTION.

NULLIFICATION, in American history, the formal suspension by a State within its territorial jurisdiction of a law of the United States. A political doctrine first suggested in the Kentucky Resolutions of 1798. Its fundamental principle was accepted by the Hartford Convention of 1814, but it was not until 1832 that the theory was fully developed by the master mind of Calhoun, and acted on by South Carolina in its famous Nullification Ordinance of 24 November of that year. The Federal Constitution recognized both the Union and the States as bearers of power, but did not clearly apportion it between them, nor clearly deter-

mine, in cases of disputed claims, which was the final arbiter. The nation possessed only delegated authority, while to the States remained the residuary powers. Calhoun, in elaborating this doctrine, claimed that historically the States came into being first and were the creators of the Union, the grantors of power to their agent, the Federal government. It followed, therefore, as a natural consequence, that the final judge of the amount of power granted could not lie with the created—the agent—but must remain with the States as the creator. Also at this point the question arose in regard to the remedy should the agent of the States exceed the authority delegated, and pass laws that were contrary to the reserved rights of the partners in the Union. The fundamental basis then of nullification as Calhoun developed it was State Sovereignty (q.v.); and, in cases where the Nation was encroaching on the reserved rights of the States, he found in nullification a peaceable remedy. Secession and revolution were thus to be made unnecessary. The Union was as perfect after as before nullification. All rights and duties of the States and the Union remained unchanged except in regard to the one nullified and therefore void law. Should any of the co-States desire to test the matter a constitutional convention might be called, and the question be settled by process of amending the Constitution; but till overruled in this way the law was void in the nullifying State.

The cause of nullification is bound up in a compound of the protective tariff and sectional slavery. The former offered the immediate occasion for its promulgation, while the conditions that made protection popular in one section, and hated in the other, were found in the latter. As late as 1816 the South was not radically opposed to a protective tariff. But under the slave system manufactures and commerce did not develop. The South therefore could not profit by the protective system, and gradually developed a strong opposition to its continuance. By 1828, under the teaching of President Thomas Cooper, of the University of South Carolina, public opinion in that State had come to hold that the producer and not the consumer paid the tariff duty. It was also noted that about three-fourths in value of all exports from the United States consisted of the products of the South, cotton, rice, tobacco, etc. Therefore, in harmony with Cooper's teaching, the South paid approximately three-fourths of the government revenues derived from imported goods. Hence the demand for lower duties grew apace. But instead of lower rates the tariffs of 1824 and 1828 raised them. The tariff of 1828—"the tariff of abominations"—aroused Calhoun to seek a remedy. In that year he set forth his nullification theory tentatively, but did not press for action under it. By 1832 the National debt having been extinguished, the South at once began to demand a lower tariff, insisting that the extinction of the public debt removed all excuse for the longer continuance of high duties—of protection. Instead, however, of revising the tariff in 1832 in such a way as to reduce it to a revenue standard, the duties in the new law were placed on a protective basis, and that principle affirmed to be adopted as a permanent one. In South Carolina, for some years, a struggle be-

tween the nullifiers and the anti-nullifiers to control the legislature had been in progress. The tariff act of 1832 for the first time gave the necessary two-thirds majority to the nullifiers, and on 24 Oct. 1832 the Senate by a vote of 30 to 13, and the House by 99 to 25 resolved to call a convention to meet 19 November. On 24 November the convention voted 136 to 26 to declare the tariff acts of 1828 and 1832 null and void, because beyond the powers delegated to the United States. The convention also authorized the legislature to pass all laws necessary to enforce the ordinance of nullification. Laws were accordingly passed to prevent the collection of the tariff within the State, to give to the governor the power to call out the State militia, and to give the State courts full control of all cases involved under the tariff laws.

President Jackson in his annual message of December 1832 barely noticed this nullification action, but in his celebrated Proclamation of 10 Dec. 1832 he discussed the subject in all its aspects. He denied the possibility of nullification being a peaceable remedy. He asserted the National as opposed to the States Rights interpretation of the Constitution, and concluded with an earnest plea for the Union. He appealed to the people of South Carolina not to be misled, not to be deceived into thinking that their action could end short of war and treason. He pictured their fate and the fate of the Union should they persist in their policy. In the meantime Congress had taken the matter into consideration. The great Webster-Hayne debate of 1830 had awakened the people to a realization of the issue. Now in February 1833 Calhoun and Webster were pitted against each other in the Senate of the United States, in the greatest constitutional discussion concerning the nature of the Union and the powers of the States that had ever occurred in the American Congress. Webster supported Jackson in his national views, while Calhoun reaffirmed the constitutionality of nullification, as a peaceable remedy, against the usurpation of power by Congress. Webster presented the Supreme Court as the final arbiter in disputed cases. Calhoun claimed that this would be making the agent the judge of his own powers—an impossible principle. The request of the President that he be granted increased powers was now met by the introduction of the so-called Force bill 21 January. The bill, however, made no progress until the introduction of Clay's Compromise Tariff bill 12 February. The two measures then moved forward with equal step. The one gave the President power to collect the revenues in South Carolina, using the whole power of the government for the purpose, if necessary; the other provided for a gradual reduction of the tariff duties, until by 1842 no duty should exceed 20 per cent, a revenue basis. The two measures reached the President at practically the same time:—he signed them both 2 March 1833, and on 16 March South Carolina repealed her ordinance of secession. Both parties could thus claim a victory; the administration and its friends, as well as Clay, in that the protective tariff still existed; the nullifiers in the fact that provision was made to reduce the tariff to a revenue basis, thus in fact yielding to South Carolina, at the very moment of adopting the Force bill.

Nullification as a constitutional and peaceful

remedy against oppression was never again asserted, but the basis of the theory—the doctrine that the States were sovereign—was not abandoned. In fact it was advocated even more strenuously than before. Instead of nullification in the Union, as a remedy, the doctrine of secession—a separation from the Union—gradually became the accepted principle of the States Rights school of statesmen. The advocates of the latter view held that to nullify a law and remain a member of the Nation was absurd; but affirmed that in case of a breach in the compact to withdraw from the Union was a constitutional right that flowed naturally from the character of the Union. H. W. CALDWELL,

Professor of American History, University of Nebraska.

NULLIPORE, a name given to certain more or less massive sea-weeds of the family *Rhodophyceæ*, common on rocky shores in warm climates, and especially about coral islands, where they serve to protect the corals somewhat against the beating of the waves. From secreting lime on their surface, and hence resembling coral, they were formerly supposed to be a kind of zoophytes. Some small species occur on the northern Atlantic coasts.

NULLITY OF MARRIAGE. The entire invalidity of a supposed, pretended or attempted marriage, by reason of the relationship or incapacity of the parties or other diriment impediments (absolute bars to marriage). An action seeking a decree declaring such an assumed marriage to be null and void is called a suit of "nullity of marriage." Nullity of marriage differs from an action for divorce, because the latter supposes the existence of a valid and lawful marriage. See MARRIAGE.

NUMA POMPILIUS, nū-mā pom-pīl'i-ūs, 2d king of Rome, belongs to the legendary period of Roman annals. According to ancient accounts he was from Cures, in the land of the Sabines, and was distinguished for wisdom and piety. He was elected king after the year's interregnum following the death of Romulus. His lengthy and quiet reign (39 years) he devoted to the adequate establishment of religion; and to him the Romans ascribed their whole system of worship and ceremonial law. He also founded the temple of Janus, which during his rule remained closed. The sacred books of Numa, containing the prescribed manner of observance for the rites and ceremonies of religion, were said to have been entombed, and to have been discovered in 181 B.C. This story is now regarded as a forgery. Consult Carter, 'The Religion of Numa' (New York 1906); Lewis, G. C., 'Credibility of Early Roman History' (1855); Plutarch, 'Numa.'

NUMANTIA, nū-mān'shī-a, Spain, an ancient town, situated on the Douro, near the

place now called Soria in Old Castile. It is famous for its resistance to the Roman power. While the neighboring places yielded to the Romans, the Numantians were firm in refusing submission. Large forces under the prætor Pompeius Aulus (137 B.C.) and the consul Hostilius Mancinus were repulsed. Scipio Africanus, the younger, with an army of 60,000 was sent to subdue them. He surrounded the town and famine compelled them to yield after a siege of 14 months. The conqueror destroyed the town, 133 B.C.

NUMBERING MACHINE, in printing, a machine for impressing consecutive numbers on account or record books, coupons, railway certificates, bank-notes, railway tickets, etc. The invention is that of Blaise Pascal (1650), and consists of discs or wheels decimally numbered on their peripheries, the whole mounted on one axle upon which they turn freely, acting upon each other in serial order. The first wheel of the series containing the units is moved one figure between each impact, and when the units are exhausted the tens come into action, and act in coincidence with the units, which continue their action.

NUMBERS, Book of. The book of Numbers is the fourth of the so-called "Five Books of Moses," or the "Pentateuch," which constitutes the first division of the Hebrew Bible. The Jews call the book *Bemidbār* ("In wilderness"), which is the fifth word of the first verse, or *Wayedhabbēr*, "And he said," which is the opening word. The designation *Numbers* originated with the early Greek translation known as the Septuagint; it was suggested by the fact that the opening chapters narrate the numbering of the people who came out of Egypt; consequently, the name is meant to be descriptive of the contents of at least a portion of the book. A similar name was in use among the Jews after the opening of the Christian era, for in the Mishnah appears the designation "The fifth of the mustered."

Contents.—The early chapters of Numbers are closely connected with the books of Exodus and Leviticus; the closing chapters with Deuteronomy. The book may be divided into three parts: (1) Events before Mount Sinai (i, 1-x, 10); covers a period of 19 days, beginning one month after the setting up of the tabernacle (compare i, 1 with Exod. xl, 17). (2) Wanderings from Mount Sinai to the Plains of Moab (x, 11-xxii, 1) from the 20th day of the second month of the second year to the 40th year. (3) Happenings in the Plains of Moab (xxii, 2-xxxvi, 13); covers the closing months of the desert wanderings.

The contents may be summarized as follows: The book furnishes an account of the wanderings of Israel from the encampment before Mount Sinai to the settlement east of the Jordan. The arrival of Israel at Mount Sinai is recorded in Exod. xix, 1; the departure from there in Numbers x, 11ff; the events recorded in i, 1-x, 10 took place during the stay at Mount Sinai. Thus the book opens with an account of the census taken of the people who came out of Egypt, which is followed by a long legal section. Then comes the record of the wanderings during the period extending from the second to the 40th year: the survey of Canaan, the refusal to enter the land, the march back to the

wilderness and various rebellions. The more important events of the first 10 months of the 40th year are narrated in detail: the march around Edom, the death of Aaron, the conquest of the land of the Amorites and of Bashan, the episode of Balaam, the sin of Baal-peor, the second census, the slaughter of the Midianites and the settlement east of the Jordan. Interspersed with the historical narratives are legal sections.

Composition.—Like the preceding books of the Pentateuch, Numbers in its present form is a compilation of material taken chiefly from three originally separate sources, commonly designated by the letters J, E and P. (For proofs of this assertion and for the significance of these symbols see article **PENTATEUCH**). The P sections are easily separated from the J and E sections, but it is rather difficult to separate the J material from the E material. The first section (i, 1–x, 10) is taken entirely from P; in the second section (x, 11–xxii, 1) the JE material predominates, whole chapters being derived from the combined JE (for instance, chapters xi, xii, xvii, xviii, xix); the closing section (xxii, 2–xxxvi, 13) is made up largely of extracts from P (for instance, the whole of chapters xxvi–xxxi and xxxiii–xxxvi); chapters xxii–xxiv (except xxii, 1) are from JE; in the rest of the section material from the several sources is closely woven together. Of the whole book only about one-fourth comes from JE. The characteristics of the several sources are discussed in the article **PENTATEUCH**. For an analysis of the book according to the several sources consult any modern commentary on Numbers or any Old Testament Introduction. The contents of each source in an English translation are arranged consecutively in C. F. Kent, 'The Student's Old Testament,' and E. S. Brightman, 'The Sources of the Hexateuch'; compare also Carpenter and Battersley, 'The Hexateuch' and W. E. Addis, 'The Documents of the Hexateuch.'

The Legal and the Narrative Sections.—The laws contained in Numbers belong to P; no laws taken from JE are found outside of Exodus. These laws, though dealing with a variety of subjects, are chiefly ceremonial in nature. They are arranged in four groups; in Division I, chapters v–ix; in Division II, chapters xviii, xix; in Division III, chapters xxviii–xxx and xxxiii–xxxvi. Though late in their present form, there is every reason for believing that the legal sections contain some very ancient elements. The narrative sections are of unequal historical value. Naturally, the JE sections, written in the 9th and 8th centuries from an objective prophetic point of view, are of considerable importance; though even they were written primarily not to record history but to reveal the hand of God in the early history of Israel. The P sections, written later, with a pronounced priestly bias, are less reliable as historical sources for the period of the Exodus; on the other hand, they throw much light on conditions at the time the narratives assumed their present form.

Poetic Fragments.—The book of Numbers has preserved several poetic fragments: (1) The Priestly Benediction (vi, 24–26), embodied in P, but pre-exilic in origin. It may have been a part of the Temple ritual in Jerusalem

prior to the exile, but its date cannot be determined. (2) The Song of the Ark (x, 35, 36), must have originated at a time when the ark was still moved from place to place, that is, before the erection of the Solomonic temple. The first two lines seem to have been addressed to the ark as it was carried into battle, the rest on its return to the sanctuary. (3) A Song concerning the boundary line between Moab and Israel (xxi, 14, 15). Only a fragment of this has been preserved, whose meaning in doubtful and origin uncertain. (4) The so-called Song of the Well (xxi, 17, 18), an ancient folk-song, the origin and occasion of which are uncertain. (5) Song concerning Heshbon, the city of Sihon (xxi, 27–30). This fragment presents numerous difficulties; the text is corrupt, as a result the meaning is obscure and the date uncertain. (6) The Oracles of Balaam (chapters xxiii, xxiv). Chapter xxii and some verses in 23 and 24, written in prose, furnish the historical setting for the utterances of Balaam, which are poetic in form. There are seven poems, four longer ones centring around Israel, and three shorter ones containing threats against other nations: (a) Israel's exaltation (xxiii, 7–10); (b) Israel's conquering power (xxiii, 18–24); (c) Israel's prosperity and strength (xxiv, 3–9); (d) Israel's conquering king (xxiv, 15–19); (e) destruction of Amalek (xxiv, 20); (f) devastation of the Kenite territory (xxiv, 21, 22); (g) an oracle of uncertain meaning (xxiv, 23, 24). It has been suggested, with some degree of probability, that xxiv, 1–19 is not the continuation of chapter xxiii but a duplicate account of the same incidents. If so, poems c and d may be simply different recensions of a and b, the former representing the tradition current in the south, the latter that current in the north. As to the date of the poems there exists much uncertainty. For the poems centering around Israel, Gray considers a date prior to Saul out of the question and a date earlier than David improbable; they may well have originated during the period of the early monarchy. Of the shorter poems the first, against Amalek, may reflect conditions in the age of David (compare 1 Sam. xxx); but the other two are usually assigned to a later date; that against the Kenites seems to presuppose the rise of Assyria, and the last oracle the dawn of Greek power.

Bibliography.—In addition to the discussions named in the body of the article, attention may be called to the following books in English: Bacon, B. W., 'The Triple Tradition of the Exodus' (Hartford 1894); Chapman, A. T., 'Introduction to the Pentateuch' (Cambridge 1911); Cornill, C. H., 'Introduction' (London 1907); Creelman H., 'Introduction' (New York 1917); Driver, S. R., 'Introduction' (1891; new ed., 1910); Eiselen, F. C., 'The Books of the Pentateuch' (New York 1916); Gray G. B., 'Introduction' (New York 1913), and 'Numbers' (International Critical Commentary series, New York 1903); Kennedy, A. R. S., 'Leviticus and Numbers' ('New Century Bible,' Edinburgh 1911); McFadyen, J. E., 'Introduction' (New York 1905); McNeile, A. H., 'Numbers' ('Cambridge Bible,' Cambridge 1911). Hastings, 'Dictionary of the Bible,' and 'Encyclopedia Biblica.'

FREDERICK CARL EISELEN,
Professor of Old Testament Interpretation,
Garrett Biblical Institute.

NUMBERS, Theory of, in its elementary part, is that branch of mathematics which deals with the properties of integers. The scope of the whole subject can be best indicated after an explanation of the idea of a *modular system* of numbers, which is fundamental in it. An adequate treatment of certain problems relating to integers requires that the system of integers (including zero) under consideration be enlarged by the introduction of certain other numbers, and that the system, so enlarged, shall retain the fundamental properties of the original system. The latter is such that it contains the difference (and hence the sum) of any two of its numbers, and this property is selected as fundamental. A system of numbers which has this property is called a *modular system*; it always contains (1) the number zero, (2) the negative of each of its numbers, (3) an infinite (see ASSEMBLAGES, GENERAL THEORY OF) number of numbers. In general it is possible to select a certain set of numbers of the system, called the basis of the system, as say, $m_1, m_2, \dots, m_n$, called the elements of the basis, and to express every member of the system in the form $x_1m_1 + x_2m_2 + \dots + x_nm_n$, where the x 's are integers. The theory of numbers is the study of certain modular systems.

DIVISIBILITY OF INTEGERS.

The set of integers, which is a very simple modular system having one element, unity, in its basis, has the additional property that it contains the product of every two of its numbers; and two large classes of relations of integers are called *additive* and *multiplicative* since they depend mainly upon ideas of addition and multiplication respectively. The introductory part of the subject deals mainly with the latter relations. For the sake of brevity there will be assumed from Arithmetic and Algebra (see ALGEBRA) the commutative and associative laws for addition, the commutative, associative and distributive laws for multiplication, the meanings of divisor, or factor, common divisor, greatest common divisor (G. C. D.), multiple, common multiple, least common multiple (L. C. M.), [a, function, and the processes for finding the G. C. D. and L. C. M. of two integers.

Factorization of Numbers.—An important and at times an exceedingly difficult problem is that of finding all divisors of a number. Certain numbers have no divisors except themselves and unity. These are called *prime*. (Two numbers which have no common divisor except unity are called *relatively prime*). All divisors of a number may easily be found if all of its prime divisors are determined, but no satisfactory method has been devised for such determination. Nevertheless certain principles are clearly understood.

Consider now one modular system consisting of all positive and negative multiples of an integer a , and another consisting of all such multiples of another integer b . It may be shown that (1) the set of numbers consisting of all of the numbers of these two systems and also of the sums of all pairs of them is a modular

system consisting of the positive and negative multiples of d , the G. C. D. of a and b . For if any two integers of the first system be ax_1, ax_2 , and if any two of the second system be by_1 and by_2 , then any two of the third system can be represented by $ax_1 + by_1$ and $ax_2 + by_2$. The difference of these, $a(x_1 - x_2) + b(y_1 - y_2)$, is in the third system, since it is the sum of $a(x_1 - x_2)$ and $b(y_1 - y_2)$, which are in the first and second systems, respectively. The third system is, then, a modular system, and consists of all multiples of its smallest number, n , say. Since a and b are in the third system, n must be a common divisor of a and b . But every number of the system, being of the form $ax + by$, is divisible by d . Hence $n = d$.

As an example, let $a = 6, b = 8$, whence $d = 2$. The three systems are respectively
 $\dots, -24, -18, -12, -6, 0, 6, 12, 18, 24, \dots$
 $\dots, -32, -24, -16, -8, 0, 8, 16, 24, 32, \dots$
 $\dots, -8, -6, -4, -2, 0, 2, 4, 6, 8, \dots$

Corollary (2). If two integers a, b , have their G. C. D. equal to d , there exist integers x, y , such that $ax + by = d$. (This is true even if $d = 1$).

Example 1. $a = 6, b = 8, d = 2; 6 \cdot 3 + 8(-2) = 2$.

Example 2. $a = 5, b = 6, d = 1; 5 \cdot 5 + 6(-4) = 1$.

The following result is used repeatedly in later arguments:

Theorem (3). If of three numbers a, b, c , two of them, a and b , are relatively prime, then every common divisor of ac and b is a common divisor of b and c . For let ac and b have a common divisor d . Since a and b are relatively prime there exist numbers x and y , such that $ax + by = 1$. Then $acx + bcy = c$. But d is a divisor of acx and bcy , and hence of c . It is therefore a common divisor of b and c .

Corollary (4). If a and b , and also b and c , are relatively prime, so are ac and b .

A theorem of fundamental importance in relation to the factorization of numbers may now be proved.

Theorem (5). A positive integer can, in one and only one way, be represented as a product of prime factors.

If possible, let an integer n be expressed by two different products of prime factors, $p_1p_2\dots p_k$ and $q_1q_2\dots q_l$, where in each case the order of the factors is such that a smaller factor never follows a larger. Then $p_1p_2\dots p_k = q_1q_2\dots q_l$. If any factor, as p_2 , were not present in the second product it could not be a divisor of that product, nor of n (see 4). A continuation of this argument yields a *reductio ad absurdum*.

For large numbers the problem of factorization is very difficult, but for small ones it is comparatively easy. For since the smallest prime factor of a number n , not itself a prime, cannot exceed $\sqrt{n}$, it is necessary to test only prime factors up to $\sqrt{n}$.

Distribution of Primes.—The proof that the number of primes is infinite was given by Euclid, and is singularly brief. The assumption that there is a largest prime, p , is shown to be incorrect by the consideration of the number $1 + p$, which, not being divisible by any number less than $(p + 1)$, must either be divisible by a prime greater than p or be a prime itself.

The law of distribution of primes has been

carefully studied, but the investigations cannot be presented here, the law being a very obscure one. Two special results are of some interest. It has been shown that between any number n (>1) and its double, $2n$, there is at least one prime, and also that any number, m , of consecutive numbers can be found, no one of which will be prime.

Number and Sum of Divisors of a Number.

—If the number 55125 be expressed by means of its prime factors the result is $3^3 5^3 7^2$. Now every divisor of this number must be a product of powers of 3, 5 and 7. In fact, all of these divisors are terms in the expansion of the product $(1+3+3^2)(1+5+5^2+5^3)(1+7+7^2)$. This expansion contains $(2+1)(3+1)(2+1)=36$ terms. Hence the number of divisors of 55125 is 36. Again, the product mentioned is equal to the sum of these 36 divisors.

Also $(1+3+3^2)=\frac{3^3-1}{3-1}$ (see ALGEBRA, *Geometrical Progression*). Hence the sum of all divisors of 55125 is $\frac{3^3-1}{3-1} \frac{5^4-1}{5-1} \frac{7^3-1}{7-1}$. In

general, if $n=p_1^{a_1} p_2^{a_2} \dots p_k^{a_k}$ the p 's being primes, (6) the number of divisors of n is $(a_1+1)(a_2+1)\dots(a_k+1)$, and (7) their sum is

$$\frac{p_1^{a_1+1}-1}{p_1-1} \cdot \frac{p_2^{a_2+1}-1}{p_2-1} \dots \frac{p_k^{a_k+1}-1}{p_k-1}$$

Number of Numbers less than a Given Number and Relatively Prime to It.

The number $10125=3^3 5^3$. The numbers less than 10125 and relatively prime to it are those which are not divisible by 3 or by 5. From the first 10125 numbers all multiples of 3, and all multiples of 5, should be omitted. There are $\frac{1}{3} \times 10125$ multiples of 3, and $\frac{1}{5} \times 10125$ multiples of 5, but some of these, the $\frac{1}{15} \times 10125$ multiples of 15, are multiples of both 3 and 5. Hence the number of numbers relatively prime to and less than 10125 is $(10125 - \frac{1}{3} \times 10125 - \frac{1}{5} \times 10125 + \frac{1}{15} \times 10125) = 10125 (1 - \frac{1}{3}) (1 - \frac{1}{5})$, since the multiples of 15 should not be removed twice. In general, if $n=p_1^{a_1} p_2^{a_2} \dots p_k^{a_k}$ it may be shown that (8) the corresponding number, which is always denoted by $\phi(n)$, is $n \left(1 - \frac{1}{p_1}\right) \left(1 - \frac{1}{p_2}\right) \dots \left(1 - \frac{1}{p_k}\right)$. For example

$\phi(7)=6$, $\phi(10)=4$, $\phi(p)=(p-1)$. This important function $\phi(n)$ has the notable properties. (1) If n and m are relatively prime $\phi(nm)=\phi(n)\phi(m)$; (2) If $d_1, d_2, d_3, \dots$ are all of the divisors of n , $\phi(d_1)+\phi(d_2)+\phi(d_3)+\dots=n$.

THEORY OF CONGRUENCES.

Consider the modular system consisting of all positive and negative multiples of a positive integer m . Then any integer either is in this system or differs from a number of it by a number r , less than m . Hence every integer is expressible in the form $mq+r$. Integers may then be divided into m classes, all those in any class having the same remainder when divided by m . Then the difference between two numbers of the same class is divisible by m , and these two

numbers are said to be *congruent with respect to the modulus* m . If n_1 and n_2 are in the same class, this relation is written $n_1 \equiv n_2 \pmod{m}$, a notation which is due to Gauss. The statement is called a *congruence*. Thus the modulus being 3, the numbers 7 and 16 belong to the same class, since each gives the remainder 1 when divided by 3. Then $7 \equiv 16 \pmod{3}$, or in other words, the difference between 7 and 16 is a multiple of 3.

The following are fundamental properties of congruences, the modulus, when omitted, being m :

- (9) If $a \equiv b$, and $a \equiv c$, then $b \equiv c$.
- If $a \equiv b$, and $c \equiv d$, then $a+c \equiv b+d$, and $ac \equiv bd$.
- If $a \equiv b$, then $ca \equiv cb$.
- If $ca \equiv cb$, and if d is the G. C. D. of c and m , then $a \equiv b \pmod{\frac{m}{d}}$.

Between the methods used and the results obtained in the theory of congruences and the methods and results in the apparently unrelated field of the theory of equations (see EQUATIONS, GENERAL THEORY OF), there is a parallel so striking that one acquainted with the latter can promptly select, and even solve, a great many of the most important problems relating to the former. Thus congruences may state relations between known quantities only, or between known and unknown quantities, in the latter case suggesting the problem of finding possible values of the unknown quantities. Congruences of the latter sort may be classified either according to the number of the unknown quantities or according to the degrees of the expressions with respect to these unknown quantities. Thus if $f(x, y, z, \dots)$ is an algebraic expression containing several unknown numbers $x, y, z, \dots$, as well as known numbers, the standard problem is: *To determine integral values for $x, y, z, \dots$ such that the congruence $f(x, y, z, \dots) \equiv 0 \pmod{m}$, shall be true.* A set of values of the sort required constitutes a *solution* of the congruence. If there is only one unknown number in the congruence, any value of that number for which the congruence is true is called a *root* of the congruence. Two roots which are congruent are regarded as the same root.

Consider now congruences which contain only one unknown number x , and in particular, congruences of the form $f(x) = a_0 x^n + a_1 x^{n-1} + \dots + a_n \equiv 0 \pmod{m}$ where $a_0, a_1, \dots, a_n$ are integers, a_0 being relatively prime to m . Then by methods parallel to those of the theory of equations it may be proved that when the modulus is prime (1) the congruence has not more than n different roots; (2) if r is any integer, the remainder free from x obtained when $f(x)$ is divided by $(x-r)$ is congruent to $f(r) \pmod{m}$; (3) if r is a root of the given congruence, the remainder obtained by dividing $f(x)$ by $(x-r)$ is congruent to zero $\pmod{m}$.

Linear Congruences.—The general congruence of the first degree in x , namely, $ax + a_1 \equiv 0 \pmod{m}$, a_0 being relatively prime to m , has just one root. For of the m numbers $a_0, 2a_0, 3a_0, \dots, (m-1)a_0, ma_0$, no two differ by a multiple of m (see 9). Hence just one of them belongs to each of the m classes of numbers. If ka_0 and $-a_1$ belong to the same class, then

$\{ka_0 - (-a_1)\}$ or $ka_0 + a_1$ is a multiple of m . Hence $ka_0 + a_1 \equiv 0 \pmod{m}$; and k is a root of the congruence.

Corollary: The congruence $ax \equiv 1 \pmod{m}$ (a_0 relatively prime to m) has just one root, a_0 , say.

In this case the numbers $a_0, \bar{a}_0$ are called *associate numbers*.

If in the congruence $ax + a_1 \equiv 0 \pmod{m}$, a_0 and m have as G. C. D. the number d , the congruence has no roots unless a_1 is divisible by d , in which case it has d of them. For suppose that $a_0 = a'_0 d$, $a_1 = a'_1 d$, $m = m' d$. Then if $a_0 x + a_1$ is divisible by m , $\frac{a_0 x + a_1}{d}$ or $a'_0 x + a'_1$ is divisible by m' , and conversely. But the congruence $a'_0 x + a'_1 \equiv 0 \pmod{m'}$ is of the sort considered just above, and the numbers which satisfy it are all congruent $\pmod{m'}$. It has then only one root, say $k \pmod{m'}$. All numbers which satisfy the latter congruence are roots of the former, but they are not all congruent $\pmod{m}$. On the contrary, with respect to the modulus m , there are d distinct sets, and the original congruence has d roots $k, k + m', k + 2m', \dots, k + m'(d-1)$.

The last result furnishes an interesting example of the failure of the parallel between the theory of congruences and the theory of equations. Of these there are not a few. They generally occur when the modulus is not prime. Another interesting example is the possibility of solving several simultaneous congruences in one unknown quantity, the moduli of the congruences being different.

Theorems of Fermat and Wilson.—Before discussing the various classes of congruences of higher orders it is convenient to exhibit two of the most interesting results of the whole subject. They are the theorems of Fermat and Wilson.

FERMAT'S THEOREM. If p is any prime number, and a any number less than p and greater than zero, then $ap^{-1} \equiv 1 \pmod{p}$.

Consider the set of numbers $a, 2a, 3a, \dots, (p-1)a$. No two of them are congruent $\pmod{p}$. Hence they are congruent to different ones of the numbers $1, 2, 3, \dots, (p-1)$, though not necessarily in this order. The product of the first set is congruent to the product of the second set, whence $ap^{-1} |p-1 \equiv |p-1 \pmod{p}$. Then $ap^{-1} \equiv 1 \pmod{p}$ since $|p-1$ is relatively prime to p (see 9).

The statement of Wilson's theorem is: If p is any prime number, $|p-1 \equiv -1 \pmod{p}$.

Both of these theorems have been so generalized as to apply to the case in which the modulus is not prime.

Fermat's theorem furnishes another instance of the failure of the parallel between the theory of numbers and the theory of equations. For from it we see that the congruence $x^p \equiv x \pmod{p}$ is satisfied by every number of the system of integers.

Congruences of Higher Orders.—The general quadratic congruence may be written $a_0 x^2 + a_1 x + a_2 \equiv 0 \pmod{m}$. Its solution may be reduced to the solutions of a linear congruence and of a binomial congruence of the form $x^2 \equiv a \pmod{m}$. In connection with this congruence the important questions are: (1) What

relation must exist between a and m in order that the congruence may be solvable? and (2) What are the roots of a congruence of this sort which is known to be solvable? According as the congruence is or is not solvable, a is said to be a *quadratic residue* or a *quadratic non-residue* of m .

In regard to the first question it may be noted that if $(x^2 - a)$ is divisible by m , it is divisible by every prime factor, p , of m . Hence if the congruence is solvable a must be a *quadratic residue of every prime factor of m* . It may also be proved that the product of two numbers is a quadratic residue if each number is a residue, or if each is a non-residue, but that the product is a non-residue if only one is a residue. Hence it is possible to determine whether a is a residue of m if one finds whether each prime factor of a is a residue of each prime factor of m . This procedure raises three distinct questions, for a may have as factors, $1, 2$ or odd primes. It is easy to show that, p being a prime factor of m , (1) -1 is a *quadratic residue of all primes of the form $4n+1$* (e.g., 13, 17, 29), but a *non-residue of all primes of the form $(4n+3)$* (e.g., 23); and (2) 2 is a residue of all primes of the form $(8n+1)$ or $(8n-1)$ (e.g., 17, 23), but a non-residue of all primes of the form $(8n+3)$ or $(8n-3)$ (e.g., 11, 29).

To determine whether a given odd prime, p , is a quadratic residue of another odd prime q , use is made of the famous Reciprocity-Theorem, first proved by Gauss. This theorem states that if, of two odd primes p and q , one is of the form $(4n+1)$ then each is a quadratic residue of the other, or each is a non-residue of the other; while if both primes are of the form $(4n+3)$, one is a residue or non-residue of the other according as the other is a non-residue or residue of the one. This theorem is the most celebrated one in the theory of numbers; it has been proved in a great variety of ways. Gauss himself having contributed seven distinct proofs. The application of this result and of the two preceding ones is greatly facilitated by the use of what is known as Legendre's Symbol.

Legendre's Symbol.—It is found that according as a number a is or is not a quadratic residue of p , a certain function of a and p is congruent to $+1$ or $-1 \pmod{p}$. Legendre introduced the symbol $\left(\frac{a}{p}\right)$, defining it to be $+1$, or -1 , according as a is or is not a quadratic residue of p . The three results stated may be written symbolically:

$$(1) \left(\frac{-1}{p}\right) = (-1)^{\frac{p-1}{2}}; \quad (2) \left(\frac{2}{p}\right) = (-1)^{\frac{p^2-1}{8}}; \\ (3) \left(\frac{p}{q}\right) \cdot \left(\frac{q}{p}\right) = (-1)^{\frac{p-1}{2} \cdot \frac{q-1}{2}}.$$

The use of the third result may be illustrated by taking $p=13, q=3$. Then $\left(\frac{13}{3}\right) \cdot \left(\frac{3}{13}\right) = +1$.

But two congruent numbers are both residues or both non-residues. Hence, since $13 \equiv 1 \pmod{3}$, $3, \left(\frac{13}{3}\right) = \left(\frac{1}{3}\right)$. Moreover 1 is a quadratic resi-

idue of every number. Hence $\left(\frac{1}{3}\right) = +1$:

and so $\left(\frac{3}{13}\right) = +1$. Accordingly 3 is a quadratic residue of 13.

The difficulties of solving a binomial quadratic congruence which is known to be solvable are relatively slight, and the question will not be considered here.

The theory of congruence of degrees higher than the second is far from complete. Considerable attention has been given to binomial congruences of the form $ax^n + a \equiv 0 \pmod{m}$. Gauss found that he could not properly state the reciprocity-theorem for the case $n=4$, without making a study of the modular system of numbers of the form $a+b\sqrt{-1}$, a and b being integers. His results have been generalized and much more general modular systems have been studied. An account of these cannot be given here.

Other Branches of the Subject.—The theory of congruences belongs to the multiplicative part of the subject. Another notable branch is the theory of forms, which is essentially additive. In it the standard problem is "Given an expression $f(x, y, z, \dots)$ in which all of the numbers are integers, to determine whether by a choice of integral values for certain unknown quantities the expression can be made to assume a specified integral value." Thus in the case of the quadratic form $ax^2 + bxy + cy^2$, the problem is to find whether a specified integer m can be broken up into three integral parts of the form ax^2 , bxy , and cy^2 , and to determine in how many essentially different ways this can be done. The study of the classification of quadratic forms alone requires the use of infinite series (see SERIES) and of other agencies which at first sight seem to be entirely unrelated to the theory of integers. The theory of forms has been studied principally in connection with forms of the second order in any number of unknown quantities $x, y, z, \dots$, and forms of the second and third orders in two unknown quantities. One other branch, also of an additive nature, is the theory of partitions of numbers, the partitions of a number being the different ways of expressing it as a sum of a given number of integers. Thus the partitions of seven into four integers are $1+1+1+4$, $1+1+2+3$, $1+2+2+2$. The treatment of this subject also requires the aid of the higher analysis.

Historical Sketch.—Historically, the development of the Theory of Numbers falls into two well-defined periods, whose point of division is the year 1801. Until late in the first period the subject was not recognized as constituting a distinct branch of mathematics. The publication in 1801 of Gauss' famous 'Disquisitiones Arithmeticae' firmly established the subject as such a branch, and since that event its development has been rapid and uninterrupted.

Probably the earliest investigators in this subject were Pythagoras (580?-500? B.C.) and his followers, who were familiar with the ideas of odd and even numbers factors and multiples and primes. By the time of Euclid (about 300

B.C.) the subject included the idea of perfect numbers, that is, those which are equal to the sum of their divisors less than themselves, and of common divisors, the process for finding G. C. D., the proof that the number of primes is infinite. Diophantos (246?-300? A.D.) studied methods of finding rational solutions of indeterminate equations. His work inspired some of the best of the later writers of the first period, among them Bachet de Meziriac (1581-1638 A.D.) and Fermat (1601-55 A.D.), who edited his works. Fermat contributed several very notable results, though without proof. Among them are the theorem already mentioned in the preceding text and the theorem that no integral solutions exist for the equation $x^n + y^n = z^n$, if n is an integer > 2 . Euler (1707-1803 A.D.) proved this last theorem for $n=3$ and 4, generalized the former theorem, studied the function $\phi(n)$, stated the reciprocity-theorem and initiated the study of quadratic forms. The work of Lagrange (1736-1813 A.D.) and Legendre (1752-1833 A.D.) on quadratic forms closes the first period.

In the work which opened the second period Gauss (1777-1855) systematized the subject in much the same way as that in which Euclid brought order into the subject of geometry. He treated thoroughly the elementary theory of congruences, residues (quadratic and higher), quadratic forms and founded the modern theory of modular systems by the study of the system of numbers $a + b\sqrt{-1}$, a and b being integers. Of the many workers since Gauss' time it will suffice to mention Dirichlet, who simplified some of Gauss' methods, and made important contributions by the use of infinite series; Kummer, Dedekind and Kronecker, who considered general modular systems; and Eisenstein, Smith, Hermite, Sylvester and Minkowski, who contributed largely to the theory of forms.

NUMERALS (from Latin *numeralis*, from *numerus*, number). In mathematics the word is commonly used to designate characters which represent numbers, as in speaking of the Roman numerals. In very ancient times there were approximately as many systems of numerals as there were languages, and particularly with the higher numerals there were often quite radical modifications from century to century. The numerals most generally used by the mathematicians of classical times were the Greek; of mediæval times, the Roman; of modern times, the Hindu or Arabic. Of these, the first two were but little used in actual computation, the abacus (q.v.) answering for this purpose.

The primitive Greeks, like other early peo-

Professor of Mathematics, Teachers' College,
Columbia University, New York.

NUMERATION, the reading off of numbers that are expressed in figures. As shown in NOTATION (q.v.), the first figure on the right hand expresses units; the next, tens; the third, hundreds, and following the same nomenclature with the next three figures, we have the fourth expressing the units of thousands; the fifth, tens of thousands; the sixth, hundreds of thousands. The seventh figure, in like manner, expresses units of millions; the eighth, tens of millions, and the ninth, hundreds of millions. When this method is consistently followed out, as is the case with American, French and other Continental arithmeticians, the fourth period, or group of three figures, is denominated billions, the first figure of it (the 10th from the extreme right) being units of billions, the next, tens of billions, etc. Read in this way, the figures 27,684,563,904,209 express twenty-seven trillions, six hundred and eighty-four billions, five hundred and sixty-three millions, nine hundred and four thousands, two hundred and nine units. If every number had an independent name an ordinary lifetime would not be sufficient in which to learn them up to even 1,000,000. In Great Britain there is a variation in the mode as given above, the only effect of which is to render it more complicated: thus, after units of millions come tens and hundreds of millions, but then instead of billions we have, according to the current usage, thousands of millions; after this, tens of thousands of millions and hundreds of thousands of millions, and then billions, which occupy the 13th figure from the right, and are reckoned in the same way as millions, so that the next unit or trillions does not come in till the 19th figure. The above number, according to the British mode, would be read twenty-seven billions, six hundred and eighty-four thousand-five hundred and sixty-three millions, nine hundred and four thousands, two hundred and nine units. The first method is perfectly symmetrical, keeping throughout to divisions of three figures, the second only keeps to this division up to hundreds of millions, when it changes it for a division into parcels of six figures, which are named from units up to hundreds of thousands of units. The latter mode is, however, gradually falling into disuse. See NOTATION, ARITHMETICAL; NUMBERS, THEORY OF.

NUMERICAL APERTURE, a term used in optics; the method by which the illuminating and resolving power of high-power microscopic objectives is calculated. Since it became customary to interpose water, oil or other fluid between the object and the lens, it is found that a water immersion lens of $97\frac{1}{2}^\circ$, and an oil immersion of 82° , give equal results to a dry or air lens of 180° . This obviously depends on the diameter of the back lens of the objective and on the refractive index of the medium between lens and object. It is expressed by the formula $n \sin u$, where n is the refractive index of the medium—air or fluid—and u the semi-angle of aperture. It is thus found that an oil-lens of 180° has a numerical aperture of 1.52 against 1.00 for 180° in air. This only represents the comparative diameters of the effective pencils, and the relative illumination is, of course, obtained by squaring the numerical apertures to get the comparative areas of the pencils. We thus find that an oil-lens of 180° gives 2.310 the illumination of a dry object of 180° .

NUMERICAL NOTATION. Musical notation has been the subject of many experiments from time immemorial, and our present system is the result of long-continued development. At one time letters were used to represent tones; then came the peculiar signs known as *neumæ*; and these in turn were developed into the notes of to-day. But theorists have not been satisfied with the present system, and have tried to improve upon it in various ways. One innovation is that of designating the tones by means of numerals instead of notes. Although the ancient Persians already had a method of this kind, and Souhaity in the 17th century adopted a similar plan, it is Rousseau with whom the device in question is more especially associated. In 1742 he read a paper before the French Academy of Sciences entitled 'Projet concernant de nouveaux signes pour la musique,' in which he developed his ideas on the subject. Notes, as mentioned, were to be replaced by numbers, and the various octaves and accidentals were to be indicated by special signs. The plan did not meet with much favor, but similar schemes were from time to time brought forward again, largely by compatriots of the famous French thinker. Only one of these, embodied in the well-known Galin-Paris-Chevé system, has gained wider prominence. But the numerals in this system are only used in preparation, not replacement, of the ordinary notation, and there are other features on which the comparative popularity of the system in part depends.

It is doubtful whether any plan which endeavors to supersede the present method by means of numbers will ever be able to gain a secure foothold. In the first place, our system appears actually to be as good a one as it is possible to construct. The defect of the numerical method is that it does not appeal sufficiently to the faculty of perception. It involves the understanding rather than the eye. Its application would seem to be limited to extremely simple passages, while the extension to more involved harmonic and polyphonic sections would entail complexities as great as or even greater than those which it seeks to avoid. The staves of our present usage are a happy symbolization of musical strings, and the notes are

equally appropriate as representations of the hammers or fingers by which these strings are set into operation. To substitute numbers, therefore, would be a step backward rather than forward.

Again, the present system has been established so long that it is almost out of the question to think of replacing it with another. The attempt to do so would resemble the endeavor to establish a new system of weights and measures, or alter the spelling of entire languages. Even these latter changes, desirable though they may be, have been found impossible to effect in some countries. There is little hope, therefore, for a reform which does not promise advantages of a character so decided as to compensate for all the inconveniences incident to a change.

ALBERT GEHRING,

Author of 'The Appreciation of Music,' etc.

NUMIDIA, nū-mīd'ī-ā, Africa, the ancient Roman name for the region now corresponding roughly with modern Algeria. It was divided among various tribes, but after the Second Punic War it was united under Masinissa, and several of its rulers became noted in Roman history, more especially Jugurtha. In 46 B.C. it became a Roman province. Under the Roman emperors Numidia attained a high degree of prosperity, and Christianity was in a flourishing condition here. It was afterward conquered by the Vandals, later by the Arabs and in modern times by the French.

NUMISMATIC AND ARCHÆOLOGICAL SOCIETY, The American. See AMERICAN NUMISMATIC AND ARCHÆOLOGICAL SOCIETY.

NUMISMATICS (Greek, *νόμισμα*; Latin, *numisma*, a coin) in the science which treats of coins, their origin and technique, their history, mythology and art. A coin (Low Latin, *cuneus* = a die, and then, coin) is a piece of metal of a determined shape and weight, bearing a mark, device or type stamped upon it by government authority, which constitutes an official guarantee of the fineness and weight of the metal. The coin serves as an official and guaranteed medium of exchange, and is thereby distinguished from the medal which is a commemorative piece resembling the coin externally but having no exchange function; and also from tokens, counters, etc., which are only semi-official in origin and do not possess the permanent legal character of the coin.

It is clear from the foregoing that objects of a monetiform character, such as medals, tokens, counters, medalets, metallic tickets and the like, while included in the study of numismatics according to its widest acceptance, are only brought within the scope of the science by a considerable extension of the term. Their study, while interesting and important and sometimes indispensable, does not form the chief subject of investigation. Neither does our modern paper currency, nor do the earlier forms of money before the invention of coined money, such as shell-money, ring-money, etc., nor the ancient and modern substitutes for metal coinage in various materials such as wood, leather and shell come within the strict definition of the subject. All such objects, metallic or not, monetiform or otherwise, are studied as subordinate branches of the science

whose main point of interest is the coin. Just outside and yet partly within the definition fall the official and private commemorative insignia called decorations or orders, which, including as they do medals issued in war and peace to be worn as decorations, can scarcely be denied a place in the family group. These, then, are the widest limits of the science. The field covers the coinages of all countries from the earliest times to the present day, and it will only be possible here to indicate the general outlines of the two chief branches, coins and medals.

Coins.—The question of the origins of coinage is to-day well established. Coins were independently invented in western Asia, more precisely on the coast of Asia Minor, and this invention is the starting point of the Greek and Roman series. Again, coins appear to have been invented independently in China and also in India, in the latter case at a considerably later date. The subject is most naturally divided into four groups, Oriental, Greek and Roman, mediæval and modern coinages. Under Oriental are classed all coins emanating from the Far and Near East with inscriptions in Chinese, Arabic, Persian and Indian, i.e., all Eastern languages except (1) coins of Semitic peoples in close proximity to ancient Greece, namely, the Jews and Phœnicians, (2) the coins of the ancient Persians and the Bactrian rulers of India which are usually, because of their close relationship, grouped with the Greek coins. Oriental coins may also be described as Asiatic and they extend over the whole period embraced by our other three divisions, Greek and Roman, Mediæval and Modern. Greek and Roman coinage comprises those coins bearing Greek, Latin and allied inscriptions (with the inclusions above noted), which were struck by the peoples of the lands surrounding the Mediterranean basin and in the far-way colonies of those ancient civilizations. The period of issue is from the invention of coined money about 700 B.C. to the fall of the Roman Empire, 476 A.D. Greek coins proper fall within the chronological limits, 700 B.C. to 268 A.D. (death of Gallienus, Roman emperor). Roman coins begin as late as the middle of the 4th century, or 338 B.C., and extend to 476 A.D.

Mediæval coinage includes all European coinages from the dissolution of the Roman Empire down to about the 16th century. The line of demarcation between mediæval and modern coins is to be found in the technical execution of the piece. The "milled" coin, that is, one struck by a "mill and screw" press in place of the hand-wielded hammer, marks the beginning of modern machine methods of striking. The process of striking coins by means of a screw press instead of by hand began in England about 1651 (and still earlier in France), but was not generally adopted until 1662. The greater and ever-increasing regularity and mechanical exactness achieved by machinery led finally to the complete mathematical symmetry of the modern coin.

Greek and Roman Coins.—The most ancient civilizations preceding that of the Hellenes or Greeks had not made the important discovery of coining money. Among the peoples of Assyria and of Egypt, among the Phœnicians and the pre-Hellenic populations, known as Minoan (Cretan) or Mycenaean, coins were un-

known, although a form of money consisting of metal in lumps, rings and bars was employed in exchange. The credit of adjusting a lump of metal to a fixed weight and stamping it with a mark must be given to the Greeks of Asia Minor living along the coasts of Ionia. Ancient tradition seems to assign the invention to the Lydians of Asia Minor, and the truth is probably that the Lydians and the Ionian traders or bankers issued the first coins of the Western World. There are no fixed types on these earliest coins, and this fact and other considerations lead to the view that the issues were neither civic nor regal, but somewhat private in their nature. These pieces are bean-shaped lumps of a mixed metal called electrum found in Ionia as a natural alloy consisting of gold and silver in a variable composition. The obverse or face of the coin is the side which at first bears the device or type. An example of a very primitive coin without any type is shown in plate I, 1. The obverse is merely roughened while the reverse has three irregular punch marks or incuses. Animal types are very common devices on the earliest coins, e.g., the stag (plate I, 2), the lion (plate I, 3) and lion and bull confronting (plate I, 4). The coin with a stag (unique, British Museum Collection) is remarkable for the Greek inscription reading: "I am the badge of Phanes," and was perhaps struck at Ephesus. At about the same time as the earliest Ionian coins, i.e., about 650 B.C., arose the silver coinages of Ægina, Corinth, Chalcis and Eretria (in Eubœa) in Greece proper. The coins of Athens, about 594 B.C., are among the earliest that show double types, i.e., a device on both obverse and reverse. The early Corinthian piece, called a stater or standard coin (plate I, 6) and the primitive currencies of Athens (plate I, 7) and Ægina (plate I, 8) formed together with the electrum staters of Asia Minor the chief currency of the period 700-480 B.C., the epoch of archaic art.

To Cræsus of Lydia, 561-546 B.C., belongs the credit of introducing a coinage of pure gold and silver, 10 of the silver pieces passing for one of the gold. These gold Creseids or staters of Cræsus (plate I, 4) are the earliest gold coins known, if we except the occasional pieces of the archaic electrum stater class in which the gold contents are much higher than the average (plate I, 3). The Creseids are at any rate the earliest pure gold coins. These were followed by the pure gold darics (plate I, 5) of the Persian conquerors of Lydia, named after Darius the Elder (521-486 B.C.), who issued a gold and silver coinage which became, like that of Cræsus, a state coinage of great proportions. Thus early was a standard gold coin invented which is the prototype of our modern standard gold coin, the English pound and French 20-franc piece, etc. The darics, like the electrum staters of Cyzicus in Asia Minor, and the silver tetradrachms of Athens, Ægina, etc., formed a sort of international coinage which passed readily in all the markets of the ancient world. Plate I, 9, shows a tetradrachm of Syracuse of the period about 500 B.C. still archaic in style. An intervening style called the transitional arose after the end of the Persian wars, 480 B.C., lasting for about 60 years and led up to the great blossoming of Greek art in the 4th century. Among the finest creations of Greek numismatic art are the

large coins known as Syracusan medallions, the decadrachms struck in Sicily about 413 B.C. They were victory coins issued after the defeat of the Athenians by the Syracusans. These masterpieces of die-engraving are the work of artists who signed their names on the medallions. Plate I, 10, is a decadrachm of Cimon signed KIM (Kimon) on the bandeau of the nymph's head on the obverse. Plate I, 11, is the work of Euaenetus signed EYAINET (Euainetos) beneath the head of the obverse. In plate I, 12, we have an example of the coinage of Alexander the Great which had a very wide circulation in Asia Minor following upon his conquest of the Persian Empire in 331 B.C. After Alexander's death in 323 B.C. these tetradrachms continued to be issued for 100 years or more. The conquests of Alexander extended even to the Indus (327 B.C.) and his successors founded an empire in Bactria, thus carrying the Greek types far to the East. The portraits on the Bactrian issues (plate I, 13—Antimachus) are very realistic and purely Greek in style.

The earliest coins of the Roman series are those issued for the Roman population in Italy and consist of large cast bronze issues of a most unwieldy size. The more primitive currency consists of irregular bronze lumps or ingots called *aes rude*. The next currency, *aes grave*, is regular in its shape which is circular and the coins weigh about a pound (Fig. A).

FIG. A.

These coins were issued about 335 B.C., and there were various subdivisions of the standard piece or *As* which is here represented bearing the head of Janus. Under the head horizontally is the mark of value, 1, or unit. The *aes grave* currency was issued in six denominations, viz., the *as*, the *semis* (half), *triens* (third), *quadrans* (fourth), *sextans* (sixth) and *uncia*, ounce or twelfth. At first these were of the liberal (pound) weight, but the system suffered a succession of reductions in weight from 335-89 B.C., at which final date the *As* had a minimum weight of one ounce or one-tenth of the old Oscan pound of 273 grams. The silver *denarius* or piece of 10 asses, with its half (*quinarius*) and quarter (*sestertius*) was first

struck in 268 A.D., and this with the bronze currency just described above forms the chief coinage of the Republican period. The Republican silver coins used to be known as Consular or "family" coins from the presence on them of the names (at first abbreviated) of officials who used the Roman gentile name. These officials were monetary magistrates, not consuls, although the consuls may have originally been in charge of the issue of coinage. The Republican silver and bronze coinage has been arranged chronologically in the catalogue of the British Museum, but the sales catalogues continue to follow the old family, or gentile, alphabetical system. Under the Roman emperors the currency was composed of the gold *aureus* (plate I, 15—Augustus, 29 B.C.—14 A.D.), the silver *denarius*, and the new coinage consisting of the large brass coin called the *sestertius* (of four asses) (plate I, 14—Nero, 54–68 A.D.), the middle brass, *dupondius* (two asses) and the copper pieces, the *as*, *semis* and *quadrans*. The obverses bear portraits of the emperors and the imperial family. The art is often excellent in the first two centuries after which it suffered a decline. The head of Faustina the Younger (plate I, 16), the wife of Marcus Aurelius, is a good example not of the finest, but still of excellent work. The appearance of the portraits of women of the imperial family is not to be understood as signifying that such coins were struck by the sovereign right of the empress or daughter of the emperor, for it was merely in the nature of a compliment that the portraits of the imperial family appeared on the coins.

The coins of Phœnicia, Parthia and Judæa are commonly classed with Greek coins. They are described at this particular point because we are now passing from the coinage of the Western world to that of Asia. The coins of Phœnicia, partly Hellenic and partly Oriental in character, show many interesting types of Phœnician deities. The Phœnician galley and the dolphin bear witness to the maritime character of the country. The two great mints of Sidon and Tyre issued abundant coinages. Plate II, 1, a coin of Tyre, 450–400 B.C., shows the dolphin above the waves and reverse, owl accompanied by the Egyptian royal emblems, the crook and flail. The independent coins of the Jews were probably first struck during the reign of Simon Maccabæus under the right of coinage granted by Antiochus VII of Syria in 139–138 B.C. The well-known shekel (plate II, 4) bears the sacred cup with the inscription "shekel of Israel" and "year 2"; the reverse has for type a branch with three buds and inscription "Jerusalem the Holy." The coins of Parthia begin in the 3d century B.C. and continue to about 220 A.D. These people gained their independence (248 B.C.) from the Seleucid kings who as successors of Alexander the Great had ruled Persia. The silver drachms and tetradrachms bear portraits of Oriental looking rulers in a Greek style. (Plate II, 1, MITHRADATES I, 174–136 B.C.). The reverse type, a Parthian archer in Oriental dress, is a fit emblem of this warlike race. The ancient Persian coinage, as we have seen above (plate I, 5), has a distinctively Western character and it was therefore described in connection with the Greek series. The Parthian coins are of Greek weight and

fabric (i.e., external appearance), and their types reveal a Greek origin. But the coins of the Sassanians, a Persian race which overthrew the Parthians (226 A.D.), are of true Oriental character. The coins are thin and flat in relief, being thus sharply differentiated from Greek coins. The types are: obverse, portrait of king in high Oriental head-dress; reverse, the Persian fire altar flanked by two attendants. The inscriptions are in Pehlevi. On the coin figured on plate II, 2 (Sapor II, 309–380 A.D.) the bust of the deity is placed above the altar where flames are usually seen. This coinage continued down to 651 A.D. when the Arabs conquered Persia.

Oriental Coins.—The Arabic coinage begins shortly after the establishment of the Arab dynasty, 661 A.D. The earliest coins are imitations in gold and copper modeled upon the coins of the Byzantine emperors of Constantinople. The Byzantine coinage (plate II, 14–17) is an outgrowth of the Roman imperial series, but as it was such a prolific currency and extended through the mediæval period, it is best treated later in connection with the mediæval coinage on which it exerted a lasting influence. Plate II, 13, shows an Oriental issue which preserves the old Byzantine types and has even an inscription in Greek, ΤΗΒΕΡΙΑΔΟ = Tiberias (mint-place in Palestine) followed by same mint-name in Arabic. It was struck probably before the orthodox Arab coinage, which began in 695 A.D. The original Byzantine prototype of the obverse is seen on the gold solidus (plate II, 12) of Heraclius I and his two sons. In Persia the Arabs copied coins of Sassanian types, bust of king and Persian fire altar (cf. plate II, 2) debased in style. Plate II, 3, shows an Arabic imitation of a Sassanian coin of Chosroes, 591–628 A.D., issued by the Arab governor in Persia, Abdullah ben Hazim, in 688 A.D. at the mint of Merv in Turkestan. Outside of the circle enclosing the obverse type is an Arabic inscription reading "In the name of God." The true Mohammedan coinage begins in 695 A.D. The Arabic issues present a striking contrast to all other coinages because of their limitation to mere legends as types, since images were prohibited. The coinage covers a vast territory and its general external characteristics are the thin fabric (true mainly for mediæval period), flatness, great regularity and good execution, especially of the earlier Arab or Cufic coins, and the almost complete absence of picture types, the conspicuous exceptions being certain imitative issues. The early coins shown in plate II, 5 and 6, belong to Haroun-el-Rashid, 786–809 A.D., well known to us from the 'Arabian Nights.' The Arab conquerors of Persia struck coins of the Sassanian types just noted throughout the mediæval period in Persia. About 1520 the coinage of the Shahs of Persia begins, and its thick *flap* (or metal piece on which the coin is struck) and flowing style of writing mark it off distinctively from the earlier Mohammedan coinages. Plate II, 7, is a coin of Shah Hussein (1694–1722 A.D.).

The earliest native coinage of India begins about 350 B.C. and consists of square, punch-marked silver and copper. Plate II, 8, shows a *purana* with the swastika, an ancient symbol, the sun and various punch-marks probably stamped

by bankers or traders as in the case of the earliest Ionian coins. A local coin struck at Taxila, single die, reverse plain (plate II, 9), bears the Buddhist symbols, the Chaitya and sacred Bodhi tree enclosed in a railing. The Kushan copper coin (plate II, 10) shows Kadphises II, king of Kabul and Northern India, 85-120 A.D., standing near an altar, Greek inscription and on the reverse, the god Siva and bull. The Kushan tribes conquered the Greek kingdom founded in the Kabul Valley by the Bactrian rulers. Thus Greek and Oriental characteristics combine.

The most ancient group of Oriental coins is that of the Chinese people who evolved a type of coinage entirely unlike the coinages of the Western world, and dating probably from just as early a date as the earliest coins of the Greeks, i.e., about 700 B.C. The coinage is of cast bronze and the shapes, which are those of various implements, knives, spades, etc., suggest the age of barter when different objects of every-day use passed as media of exchange. The familiar round coins with a square hole in the centre known as "cash" were issued at a very early period and this form of coin is still in use. A knife coin of Ming City issued during the civil wars in the 3d century B.C. is shown in plate III, 1. The mark on the blade indicates the mint place. The cash here shown (Plate III, 2) is a piece of almost pure brass of the ruler Chien Lung, 1733-96. It bears the name of the reign and the words *tung pao*, "current money," and on the reverse the name of the mint in Manchu.

The coinage of Japan is comparatively modern and began about the 5th century A.D. It consists of copper coins similar to the Chinese. Silver was not uncommon. The long ingots of base silver with various stamps impressed on them were issued in the 17th and 18th centuries. Small oblong silver pieces, rather ornamental in style, called *ichi-bu* and *ni-bu*, "one bu and two bu," were struck in the 19th century. Gold pieces were issued in the form of flat plates of oblong shape, rounded at the ends, called *o-ban* and *ko-ban*, "large plate" and "small plate." The piece here shown (plate III, 3) is a *ko-ban* and is about 150 years old. Both China and Japan have adopted a modern currency, although the old currency is still in use to-day.

Mediæval Coinage.—The Byzantine coinage forms a sort of appendage to the Roman series and is so closely connected that there is scarcely any perceptible difference between late Roman and Byzantine issues. An example of an issue of the declining empire is the gold solidus (plate II, 15) of Constantius II, 337-361 A.D., which has a Byzantine appearance but is classed with the latest issues of the Roman Empire in the East. Byzantine coinage proper begins in 491 A.D. The large bronze coin of Justinian, (plate II, 14) 527-565 A.D., shows the emperor holding the globe surmounted by a cross, a Christian emblem. The reverse is occupied by a large M, the Greek numeral for 40, indicating 40 nummi, the denomination, and below C O N for Constantinople, and at the sides A N N O XIII, 13th year of the reign, hence 539-540 A.D. This coin is therefore a dated piece and this is the characteristic ancient method of dating, which is by regnal or official years. Above the M is the Christian cross again. The two solidi

following (plate II, 16, 17) of Constans II (641-668 A.D.), and of Constantine VII with his son, Romanus II (945-959), show the emperors holding the cross; also, the globe with cross and the cross on a pedestal, all typical devices. The reverse of the former bears the figure of Christ with nimbus. These then are some of the characteristic Byzantine types: bust of emperor facing holding the globe; two emperors side by side facing; three figures standing (see plate II, 12); bust of Christ facing.

The influence of Byzantine coin types may be traced in Italy and Sicily, in Russia, in France and Germany and as far north as Denmark. The source of many mediæval types is therefore to be sought in Byzantine models. The European coinage from the fall of the Roman Empire to the rise of the empire of Charlemagne consists of barbarous, largely imitative issues struck by the Visigoths, Ostrogoths, Vandals, Lombards, Merovingians, etc. The year 800 may be taken as the beginning of the true mediæval coinage for the silver denarius of Charlemagne was a definite departure from the gold coinages of the age of the barbarians who based their issues upon the old Byzantine prototypes. The year 1252, when the gold florin was first struck in Venice, may be said to fix the point of departure from the old transitional mediæval styles to the more varied and original issues of the later mediæval period. The *denier* (denarius), the *grot* (groat, groschen) and gold *florino* (florin) were the types of coins from which arose a vast multitude of denominations and issues struck by a great number of authorities—kings, dukes, bishops, popes, abbots, and so on. With the Renaissance, the coinages assume a more independent character and the European coinages are full of the fresh inspiration of a great artistic epoch. The introduction of portraits led to one of the finest developments possible in the field of coins and medals. The period of the classical Renaissance which opens with the middle of the 15th century ranks with the best Greek period (end of the 5th century and the 4th century B.C.) for the distinguished excellence in numismatic and medallic productions. In Italy artists of world renown such as Vittore Pisano, known as Pisanello, Matteo da Pasti, Sperandio, Benvenuto Cellini, and others produced large cast bronze medals modeled with unerring artistic simplicity and grace. After the 16th century the art of the coin and medal began to degenerate. A formal classicism set in which held medallic art in fetters until the revival of artistic work on the medal in modern France led to whatever is good in our modern achievements. We cannot follow the details of the development of either coins or medals in the various countries of Europe during the period succeeding the Renaissance and the modern epoch. But we must briefly describe certain phases of the coinage of our own country.

United States Coinage.—The earliest coins struck in the American colonies are the New England shillings, six-pences and three-pences issued in Massachusetts, about 1652. The shilling (plate III, 4) bore the initials N.E. (New England) and the Roman numerals XII to indicate the denomination. There is no type properly speaking, just the stamps on a thin flat

piece of silver. In 1616-24 the English of the Bermudas, known then as Sommers Islands, struck copper shillings, six-pences, three-pences and two-pences bearing a hog on one side with Roman numerals to indicate the value, and on the other side a ship. These pieces, called "hog money," constitute the earliest form of money used in the colonies, though not a native coinage. The English government refused to allow the colonies the rights of coinage and on the other hand failed to provide coins for their use. Hence, the New England shillings were struck without authority from the home government. The coins are necessarily of the most primitive design. Six-pences and three-pences were also coined. In 1652 this type was given up and the more interesting series of shillings and fractions appeared. These bore the inscription IN MASSACHUSETTS on the obverse which bears as type a tree, commonly the pine, but sometimes the oak and willow, while the reverse bore the inscription NEW ENGLAND. A. N. DOM in a circle in the centre of which was 1652, under which XII (plate III, 5). These coins continued to be struck until 1686, but the date of the piece was never altered.

For about 100 years the coinage of the colonies consisted of local and foreign token coinage, that is to say, pieces of merely nominal value, the only authorized pieces provided by the English government being the Rosa Americana copper coins issued in 1722. In 1787 the State of Massachusetts struck copper cents (plate III, 6) bearing on the obverse an Indian standing and holding bow and arrow with inscription COMMONWEALTH and a star in the field to indicate the colony, while the reverse bore an eagle with open wings in heraldic pose holding an olive branch and arrows and the inscription MASSACHUSETTS and date 1787. On the eagle's breast is CENT (or HALF CENT). In 1788 New Jersey struck copper cents bearing the following types, head of a horse above a ploughshare and NOVA CÆSAREA, while the reverse bears a shield and the inscription E PLURIBUS UNUM (plate III, 7). The State of Connecticut likewise issued similar copper cents. The first national piece was the so-called Fugio cent bearing a sun-dial above which the sun and inscription MIND YOUR BUSINESS and date 1787, while the reverse consists of a link border composed of 13 circles, and a central circle enclosing the inscription WE ARE ONE; on the band around the central circle is inscribed UNITED STATES.

These were the simple and homely beginnings in the early development of the Union. There were pattern pieces of various kinds, cents with the head of Washington, the Continental dollar, a trial piece, and so on. In 1793 the first regular coinage of the United States began with an interesting issue of large copper cents bearing a quite agreeable and not inartistic head of Liberty (plate III, 8) accompanied by the inscription LIBERTY and date and varying reverses with inscriptions UNITED STATES OF AMERICA and ONE CENT. There were also corresponding half-cent pieces. The later developments are so familiar that we need not go into the details here. There was an early gold coinage beginning in 1795, eagles and half-eagles, showing an attractive Liberty head wearing a cap and on the reverse an eagle.

With the revival of the art of the medal in modern times, the coinage of modern peoples has undergone a decided improvement. The twenty-dollar or double-eagle gold coin designed by Augustus St. Gaudens is at once original and modern and of high artistic merit. The example here shown (plate III, 9) is the first type issued, and of high relief, an effect obtained by a slightly concave "field" or space about the type. The relief, unfortunately for art, was judged too high for practical uses, and the later issues are of lower relief.

Finally, there remains to be mentioned the very interesting private gold coinage struck in California, Utah, Colorado and Carolina during and after the great discoveries of gold in 1849. There are many varieties of this unique coinage of which two are here shown: The octagonal piece (plate III, 10), a fifty-dollar gold coin of Augustus Humbert, United States Assayer, struck in 1851 and an oblong bar issued by Moffat and Company (plate III, 11).

AGNES BALDWIN BRETT.

NUMITOR, nū'mī-tôr. See ROMULUS.

NUMMULITE, a genus of *Foraminifera*, mainly extinct, which forms vitreo-calcareous, many-chambered shells having much the form of a doubly convex lens, which when flattened by pressure, as in fossil examples, led to their being likened to little coins (*nummuli*). They varied in size from that of a pinhead to that of a silver dollar. The group originated in the Carboniferous, increased and flourished at its maximum during the early part of the Tertiary period, when these foraminifers swarmed in the seas in incredible abundance. Their shells constitute the bulk of the Eocene Nummulitic Sandstone of the Old World, where it is one of the most important, if not the principal formation of the Tertiary series of rocks, in point of extent. Attaining a thickness of many thousands of feet, it ranges from the Alps and Atlas to the Carpathian Mountains; appears in Egypt, Asia Minor, Persia, and can be traced through India and China into Japan. The pyramids of Egypt are built in greater part of this nummulitic limestone. *Orbitoides* is found in the Eocene deposits of our Southern States. See FORAMINIFERA. Consult Geikie, 'Text-book of Geology' (1882), and the writings of Lyell, Prestwich and other geologists.

NUN OF KENT. See BARTON, ELIZABETH.

NUNATAK, a rock hill projecting through glacial ice in the form of an island. Particularly common near the edge of the Greenland ice sheet. See GLACIER.

NUNC DIMITTIS, *nunk di-mūt'is*, the first two words of the Latin version of the Song of Simeon (Luke ii, 29, 33), "Lord now lettest thou thy servant depart in peace," etc. It was anciently used in the Vespers or Compline services of the Eastern and Western Churches, and is found in the Book of Common Prayer as part of the evening service.

NUNCIO, *nūn'shī-ō*, a papal commissioner who permanently represents the Pope abroad, and corresponds to the secular ambassador at a foreign court. A papal commissioner who is sent on a temporary mission is styled a legate and, if a cardinal, is styled a legate *a latere*, that is, sent immediately from the side of the Pontiff. Previously to the Council of Trent the papal nuncios acted as judges in the first instances of matters which lay within ecclesiastical jurisdiction; since that time they have been formed into a kind of court of appeal from the decisions of the respective hishops.

NUNCOMAR. See HASTINGS, WARREN.

NUNEATON, *nūn-ē'tōn*, England, a town of Warwickshire, on the Anker, 17 miles north-east of the town of Warwick. It has two churches, a free grammar and several other schools. Cotton and woolen manufacturing is carried on to some extent. Pop. 27,700.

NUÑES, *noo'nyēsh*, **Pedro**, or **PETRUS NONIUS**, Portuguese geographer and mathematician: b. Alcacerdo Sal, 1492; d. Coimbra, 1577. He was professor of mathematics at the University of Coimbra. Among his works are a translation of parts of Ptolemy (1537); 'De Crepusculis Liber' (1542), in which is described the measuring instrument known as the nonius, which consists of a protractor graduated in 90ths, 89ths, . . . 46ths of a quadrant; and 'De Arte atque Ratione Navigandi' (1546). A complete edition of his works was published at Basel in 1592. It is to Nonius that we owe our knowledge of the mathematical instruments of the early Portuguese navigators.

NUÑEZ, **Cabeza de Vaca**, *noo'ñyās kā-bā'-thā dā vā'kā*, **Alvar**, Spanish explorer in America: b. Estremadura, about 1490; d. Seville, 1557. In 1527 he sailed from Spain in the ill-fated expedition of Pánfilo de Narváez in the capacity of royal treasurer and high sheriff of the expedition, which met with much ill-luck. Núñez showed great resourcefulness in his attempts to get the party back to the coast of the Gulf. The boats were finally wrecked and the survivors were washed ashore on the islands off Matadorda Bay (1528). While most of the Spaniards were retained as slaves, Núñez finally secured his liberty. He was successful in trade, exchanging the shells and wampum of the coast for hides and other inland commodities. During his eight years' captivity he also gained considerable reputation as a sorcerer and the reverence in which he was consequently held was undoubtedly an aid to his safety. He escaped; fell in with three other survivors of Narváez' undertaking and together they ascended the Rio Grande; crossed Chihuahua and

Sonora to the Gulf of California and finally (May 1536) reached Culiacan. They were sent on to the City of Mexico, which they reached in July of the same year. Thirteen months later Núñez reached Spain. The pilgrimage of 2,000 miles involved every sort of vicissitude. One result of the journey was to reveal to Spanish knowledge a great territory north of Mexico and to lead to the strange quest for the seven cities of Cibola. A joint account of their travels, given by the travelers at Santo Domingo, was printed in Oviedo's 'Historia General y Natural de Indias.' Núñez was sent as administrator or Adelantado of Rio de La Plata in 1540, and was the earliest explorer of Paraguay. In 1544 he was arrested on the charge of Irala, a follower; sent to Spain; condemned to exile in Africa, a sentence which was apparently never executed. In eight years he was officially pardoned. He published an account of his adventures in 1542. This appeared in an English version in 'Purchas his Pilgrimes' (1625); as well as in a translation by Smith (1857-71). Consult Bancroft, H. H., 'History of the North Mexican States and Texas' (San Francisco 1884); Lowery, W., 'Spanish Settlements within the Present Limits of the United States' (New York 1901); Oviedo, G. Fernández de, 'Historia General y Natural de las Indias' (Madrid 1853).

NUÑEZ, **Pedro de Villavicencio**, Spanish painter: b. Seville, 1635; d. there, 1700. He was of noble birth and early became a pupil of Murillo (q.v.) and one of the best Spanish painters of the Seville school. At Malta, where he resided as one of the Knights of the Order of Saint John of Jerusalem, he studied under Matteo Preti (q.v.), called "Calabrese." Returning to Seville he lived on the closest terms of intimacy with Murillo who expired in his arms. After the death of his great teacher he went to Madrid and there produced the picture, 'Beggar Boys Playing Dice,' which is altogether in the best style of Murillo. This work he presented to Charles II, king of Spain. 'Scenes from the Life of the Virgin' he executed for the Carmelite convent at Seville, while his fine likeness of Archbishop Spinola at Seville gives a good idea of his power and style as a portrait painter. He was an excellent portrait painter and his historical and genre compositions are, after those of Murillo, among the best of the Seville school.

NUÑEZ, **Rafael**, Colombian statesman: b. Cartagena, 28 Sept. 1825; d. there, 18 Sept. 1894. He entered Congress in 1851, became Secretary of the Treasury in 1855 and consul at Havre in 1862, and, later on, at Liverpool. He became governor of the state of Bolivar in 1876 and President of Colombia in 1879, 1883 and 1891. Several revolts took place during his occupancy of the Presidency, owing to the loosely organized form of the federation. So in 1886 Núñez carried through a reform of the Constitution by which the government was made a centralized republic and the presidential term of office extended to six years. This made Núñez virtually a dictator for the rest of his life. He was also, previous to this, a journalist, editing the *Porvenir* in Colombia and *El Continental* in New York; and he published several volumes of prose and verse, the most important

being 'La reform politica en Colombia' (Bogotá 1885).

NUÑEZ DE ARCE, Don Gaspar, Spanish dramatist and lyric poet: b. Valladolid, 6 Aug. 1834; d. 1903. He studied at the University of Toledo, became a deputy in 1865, a member of the Academy in 1876 and Minister for Colonial Affairs in 1882. Subsequently he became a senator and president of the Society of Spanish Writers. He was special war correspondent for *La Iberia* during the African campaign (1859-60), and his letters back from the front attracted nation-wide attention. His lyric verse won for him the title of the "Tennyson of Spain." Among his works are 'Gritos del Combate' (1875), poems of the revolution; 'La Selva Oscura' (15th ed.); 'La Vision de Fray Martin' (1880, 1886, on Martin Luther), translated into German by Fastenrath ('Luther im Spiegel Spanischer Poesie,' 2d ed., 1881); 'Ultima Lamentación de Lord Byron' (1879); 'El Vértigo' (1879); 'La Pesca' (1884); and 'Maruja' (1885). Among his dramas are 'Deudas de la honra'; 'Quien debe pagar'; 'Justicia providencial'; and 'Haz de leña.' In the edition 'Obras dramaticas escogidas' (Madrid 1884) are included most of his dramas.

NUÑEZ DE BALBOA. See BALBOA.

NUNIVAK, noo'ni-vāk, Alaska, an island off the west coast, in the Bering Sea; separated from the mainland by the Etolin Strait, about 48 miles wide. It is about 55 miles long and 40 miles wide; area, about 1,200 square miles. It is fertile and well wooded on the west and south; the inhabitants are Eskimos. They have considerable trade in ivory, skins and fish.

NUN'S PRIEST'S TALE, *The*, one of the stories in Chaucer's 'Canterbury Tales.' Its origin is a fable by Marie de France which was subsequently amplified in the 'Roman du Renart.' It relates the escape of Chanticleer from the jaws of the fox by inducing the latter to open his mouth for speech. Dryden modernizes the story in 'The Cock and the Fox.' In Æsop's Fables a similar narrative occurs.

NUPHAR, a genus of yellow water-lilies, order *Nymphæaceæ*. See WATER-LILY.

NUR-ED-DIN EL-BETRUJI, noor-ed-dēn' ēl-bē-troo'jē, Arabian astronomer: b. Morocco, 12th century. He was known also by the name of Alpetragius and was an authority upon astronomy in his day. He disproved Ptolemy's theory of the epicycle. See 'Alpetragii Arabis Planetarum Theoricis Physicis Rationibus Probata' (Venice 1531). Consult Suter, 'Die Matematiker und Astronomen der Araber' (Leipzig 1900).

NUR-AND-SPELL, an old English game, peculiar to the rural districts, played with a ball, which is "risen" from a trap and hit with a bat made for the purpose. The ball, called the "nur," is made of wood, a little bigger than a walnut. The bat, called a "tripstick," as it is also used to spring the trap or "spell," consists of a piece of hard wood, six by four inches, and one inch thick (the pommel), attached to a supple handle from three to four feet long, which the player grasps with both hands, giving the full swing of his body with the stroke. The game consists of the cumulative distance of a given number of strokes, the player who

has the greatest number of yards being the winner.

NURAGHE, noo-rā'gā, the name given to prehistoric monuments in Sardinia belonging to the Bronze Age. The origin of the word is unknown. It is very likely that it is derived from the Phœnician *nur*, meaning fire. The *nuraghi* are distributed all over the island, but are more frequent toward the centre and in the Nurra. In the district of Gennargentu some of them are 3,600 feet above sea-level. Notwithstanding the use of many of them as quarries by neighboring villagers, they still number between 3,000 and 4,000, suggesting a large but scattered population in pre-historic times. Sometimes they occupy inaccessible mountain tops or important sites on ridges, sometimes they are found in the approaches to tablelands, in narrow gorges and at the fords of rivers. Many are on the seashore and in fertile plains. Generally the *nuraghe* was near a spring or well. Each *nuraghe* was within sight of neighboring *nuraghe*, evidently for the purpose of signaling, and each was surrounded by a little plot of ground sufficient for the support of a family. Everything points to the supposition that they were fortified habitations and not tombs or temples.

The *nuraghe* in its simplest form is a conical tower about 30 feet in diameter at the base and decreasing in diameter as it ascends. When complete it is 60 feet high. It is built of rough blocks of stone (about two feet high), unhewn sometimes and sometimes roughly dressed on one side with bronze instruments. On the inside the gaps are often filled with clay. The roof is sometimes of wood, sometimes of earth and vaulted. The entrance almost invariably faces south, about five or six feet high. The architrave is flat, and there is a space over it to admit light and to relieve the pressure on it from above. Within the doorway there is usually a niche on the right and a stone staircase ascending in the thickness of the wall to the left. At the end of the corridor is a round central room unlighted except for the door. Small rooms or stone cupboards in the thickness of the wall occupy the sides of this chamber. The staircase leads to a platform on top of the *nuraghe*, or to a second chamber concentric with the first lighted by a window above the main doorway of entrance. Some of these simple *nuraghe* have additions, bastions or chambers; and in some cases there is a very complicated system of fortification—a wall of circumvallation with towers at the corners, protecting a small group of buildings, such as the Nuraghe Losa, near Abbasanta, and the Nuraghe Saurecci, near Guspini. Others, like the Nuraghe Lugheres near Paulilatino and the Nuraghe de S' Oreu near Domusnovas, are protected at the entrance by a regular system of courtyards—something after the fashion of a baronial castle of the Middle Ages. Stores and arms were probably kept in the recesses in the gloomy central chamber, where sometimes stone seats project from the walls and where there are traces, too, of a domestic altar. The upper floors seem to have been the residence of the chief's family. Here are hearths and a smoke-hole in the roof. The earliest type of *nuraghe* apparently coincides with the later Neolithic Age. The date of this *nuraghi* civili-

zation is now placed from toward the end of the second millennium, extending to about the 7th century B.C. Votive ships are found in some of the forts, and there are remains of marine animals used for food, shell necklaces, amber (evidently brought by sea) and blocks of copper with Ægean stamps. Many of the earlier bronze and stone figures have close analogies in Cretan finds. Whether we can regard these primitive Sards as themselves a maritime people or merely as possessing trade relations with the prehistoric Greek world is still uncertain. The fate of the nuraghi civilization is unknown. Whether from external attack or internal decay, it was already declining when Phœnician settlements began.

Close to or in sight of the *muraghe* to which they belong are the prehistoric tombs. These are of two classes: the "giants tombs" and the "tombs of the spirits," pointing in work as in name to the giant-race—Titans, Cyclops, "sons of Anak," "remnant of the Rephaim," etc., that raised cromlechs, lifted and poised the ponderous rocking-stone, erected dolmens and menhirs and built Stonehenge and "Cyclopean walls."

NUREDDIN-MAHMUD, *noq-rēd-dēn'* mā-mood', Malek al-Adel, sultan of Syria and Egypt, styled "Al Shahid," "the Martyr": b. Damascus, 21 Feb. 1118; d. there, 15 May 1174. He succeeded his father as emir of Aleppo in 1145 and repelled Jocelin de Courtenay's attack on Edessa. He held the armies of the Second Crusade (1147) at bay, and, after their departure, invaded Antioch and speedily wrested from the Christians all northern Syria, making Damascus his capital. The alliance of the Greeks and Franks against him came to nothing, and Nureddin extended his power to Egypt. But there his lieutenant Shirkoh was succeeded by the great Saladin (q.v.), who gradually made himself independent of his master. Nureddin was on his way to Egypt to punish Saladin when he died. He was highly praised by Christians and Mohammedans as a just, charitable and noble character.

NUREMBERG, *nū'rēm-bērg*, or **NURNBERG**, Germany, a city of Bavaria, in Middle

Franconia, the second in the kingdom, and once the greatest and most wealthy of all the free imperial cities of Germany. It is on the Pegnitz, 93 miles northwest of Munich. It is partially surrounded by an ancient wall flanked with towers and pierced with 10 gates, the whole enclosed by a dry ditch 100 feet wide and 50 feet deep; parts of these fortifications have been removed to make way for great extensions and improvements. The Pegnitz, traversing the town from east to west, divides it into two nearly equal parts, the north, or Sebalderseite, and the south, or Lorenzerseite, connected by numerous bridges. Notwithstanding modern improvements Nuremberg remains the quaintest and most interesting of German cities, owing to its many picturesque mediæval features. The Burg or royal palace, built (1024-1158) by Conrad II and Frederick Barbarossa, commands a glorious view of the surrounding country, and is rich in paintings and wood-carvings. Among conspicuous public edifices are the town-house, an Italian three-story building, with a fine front, and a great hall, the walls of which are decorated with paintings in oil, many of them by Dürer; the Germanic National Museum, founded in 1852 in a suppressed Carthusian monastery, a Gothic building of the 14th century, with extensive cloisters, since much extended by the addition of the adjoining rebuilt Augustinian monastery, among the first in Germany, and exceedingly rich in works illustrative of the arts and industries of the Middle Ages. The most remarkable edifice is Saint Sebald's Church, which gives its name to the north division of the town. It is a Gothic structure of great elegance externally and internally (its older parts dating from the 10th century), containing the shrine of Saint Sebald, a tomb in bronze by Peter Vischer, who, with his five sons, labored upon it for 13 years, and adorned it with nearly 100 figures, among which those of the apostles are conspicuous for size and beauty. Other buildings deserving of notice are the church of Saint Lorenz, containing a remarkable monument by Adam Kraft, exquisitely sculptured in white stone, 64 feet in height. There are several public fountains, the chief being the Schöne Brunnen, in the form of a graceful Gothic cross 63 feet high, adorned with figures. There are statues of Dürer, Hans Sachs, Melancthon and others. There is also a monument of the war with France, erected in 1876. The town library contains over 110,000 volumes, and educational institutions are numerous. Communication between the various parts of the town and with the suburbs is facilitated by electric tramways. Before the passage to the East Indies round the Cape of Good Hope was discovered Nuremberg was the great mart of the produce of the East coming from Italy and going to the north. The manufactures are still considerable, and again rapidly rising in importance. Among the most important at the present day are toys, lead-pencils, colors, chemicals, clocks and watches, brass and steel wares, playing cards, tobacco and cigars, railway-carriages, machinery, electrical apparatus, musical and scientific instruments, beer, etc. The toys made here and in the neighborhood go to all parts of the world. Printing, lithographic work, type-founding and book-binding are also extensively carried on. There are schools for the training of mechanics;

and there is a large industrial museum. The town is celebrated, in connection with its industry, for the invention of watches, wheellocks (used in discharging old muskets), gauge-plates for drawing brass-wire, clarinets and air-guns.

Nuremberg, though an ancient city, does not carry its origin so far back as Roman times. It had acquired considerable importance by the 10th or 11th centuries, and was frequently visited by the emperors of Germany. It was greatly enlarged by Conrad III, and received several embellishments and important privileges from Frederick Barbarossa. In 1219 it was raised to the rank of a free city of the empire. It early took part in the Reformation. Subsequently it suffered during the great European wars, and being repeatedly laid under contribution by both parties became so exhausted that the sources of its prosperity were almost dried up, and the population rapidly decreased by extensive emigration. Having finally incurred a load of debt, which made it an acquisition of little value to any state, it was formally taken possession of in 1806 by Bavaria, which undertook the settlement of its debts, and, by judicious arrangements, has considerably increased its trade. Many distinguished individuals have been born here, among them the poet Hans Sachs, the painter Albert Dürer (whose house may still be seen), and the sculptors Peter Vischer and Adam Kraft. Pop. about 400,000.

NURHAG, ancient round towers on the island of Sardinia. They are about 50 feet high and about 90 feet in diameter, measured at the base and outside of the platform on which the largest of them are founded. The materials are limestone, trachitic porphyry, granite or volcanic rocks, obtained from the neighboring quarries. Each block forms a cube about three feet each way, and its surface is an irregular line, such as the blows of the hammer in shaping it may be supposed to have made; the walls are without cement, within as well as without. A wall of 10 feet, built like the main structure, is surrounded by a parapet three feet high. The roof of each apartment is arched; the entrance terminates in a flat architrave, and is sometimes so high that a man can enter without stooping, and sometimes so small that he can only creep into it on his stomach, though it gets wider as he proceeds. Hence the low chambers are mere cells formed in the thickness of the wall, while the high chambers are supported by pillars. In the cells broken human bones mixed with earth, like that of ordinary graves, have been found. It is many centuries since these remarkable monuments attracted attention. The origin and aim of these structures is still, however, not free from doubt, though they are gen-

erally regarded as tombs, constructed so as to be available, in emergencies, for purposes of defense.

NURSE, Trained, is one who has followed a course of training in a school for nurses usually connected with large city hospitals, for two years or more, and who has received a diploma after a severe examination and has been graduated. It was not until the early part of the 12th century that a so-called school for nurses was organized, by the Abbess Hildegard, among her friends and associates for service in the hospitals. From this small beginning grew the system of a special training for nursing, which, however, remained in its infancy until the middle of the 19th century. In 1840 there was an organization of nurses in London which cared for the sick poor, but it remained for Florence Nightingale to give the impetus to a movement toward securing a more efficient training for nurses. This movement Miss Nightingale started in 1853. In 1870 Miss Louise Lee Schuyler, who was the founder of the New York State Charities Aid Association, organized the Bellevue Training School for Female Nurses in New York City, and in 1872 the first class of trained nurses in the United States was graduated from Bellevue Hospital. Now nearly every large hospital in the country has its training school.

The term of study, in most of the schools, is two years. In some of the small towns the course may be for six months or 18 months, and in some schools three and even four years is required. Application is made to the superintendent of the training school, and after a physical examination the applicant is received on a two-months' probation term. During this period the applicants receive board and lodging, but serve without pay, and education, strength, powers of observation and endurance are tested. If, after this probation, they prove acceptable to the superintendent, they are required to sign an agreement for the balance of the term, whereby they bind themselves to obey the regulations of the hospital and remain in the school until the term is ended. This agreement can be terminated for cause by either party. Pupils reside in the "home" connected with the hospital, wear a uniform, while on duty, and receive board, lodging, laundry work and a small compensation. Lectures are given by the members of the staff of house physicians, the visiting physicians and surgeons and head nurses. The lectures by the physicians cover anatomy, physiology, materia medica and all departments of medicine. The head nurses teach bandaging and the dressing of wounds. Obstetrics and the care of the insane are also taught. Massage is taught in a degree; but if a nurse wishes to take the full course, it requires a six-month term in a regular massage school. A diet-kitchen, where proper food for the sick is prepared, is generally under the charge of one of the head nurses. The first three months are occupied by the pupils in a general observation of the work of the hospital ward's head nurse and the assistant nurse. The care of the beds of the patients is one of the first duties learned. Taking the pulse, temperature and respiration of a patient and making a record of it on a chart provided are the next steps. In the surgical wards the dressing of slight wounds is a

part of the duties, and probably the pupil must assist in the care of the operating-room and making ready the dressing to be used after operations have been performed. The pupil is then examined and, if the examination is satisfactory, advancement to assistant nurse follows. After three months more comes another examination, and at the end of a year still another. The pupil then is a full-fledged nurse and is placed in charge of a ward, and full responsibility for the condition of the patients is placed upon her. She must receive the new patients sent from the receiving ward, note their condition and, if she thinks it warranted, send for the house physician at once. Otherwise the patients wait until the regular call. She must go with the house physician when he makes his visits to the bedside of each patient, carefully note his diagnosis of each case, make a memorandum of the medicines prescribed and see that the medicine is properly administered. She must note the least sign of change in the patient's condition, and, if for the worse, call the physician at once, or in extreme emergency be ready to know what to do and do it at once. She must be extremely self-reliant and be ready to know how to act on the instant, as the life of the patient very often depends on quick action. After graduation she goes into private practice and must be prepared any hour, day or night, to respond to a call. The salary received varies, according to the severity of the case.

In December 1887, D. O. Mills of New York, after a visit to the city hospitals, decided that the number of infirm and sick men who were in the hospitals made it a necessity to educate male nurses, and he organized the Mills Training School for Male Nurses of Bellevue Hospital, put up a building on the Bellevue grounds and gave it to the city of New York to be used as a "Home" for the male training school. The first class of male nurses was graduated from Bellevue in 1890. The male training school idea was taken up by the physician in charge of the City Hospital, on Blackwell's Island, and the first class graduated from there in 1890, shortly after the Bellevue class. The training is the same as in the female schools, the only difference being that greater attention is bestowed upon diseases of men. When the male nurse begins private practice his salary ranges from \$5 a day of 12 hours to \$10; and, in contagious or infectious diseases, to even more.

State registration of trained nurses is now a law in New York, Virginia, North Carolina, New Jersey, Maryland, Indiana, California, Colorado, Connecticut, New Hampshire, District of Columbia, Iowa, West Virginia, Minnesota, Illinois, Georgia, Wyoming, Washington, Texas, Oklahoma, Nebraska, Delaware, Pennsylvania, Missouri, Michigan, Massachusetts. The legislatures of these States passed bills between 1903 and 1910 requiring trained nurses to register their names and addresses with the county clerk of their respective counties. In the State of New York registered nurses are entitled to use the abbreviation "R.N." after their names, and it is made a misdemeanor punishable by fine for any person not a trained nurse to use the abbreviation. Nothing, however, contained in the acts is considered as conferring any authority to practise medicine or to undertake the treatment and cure of diseases.

Examinations are held under a commission of five members of the New York State Nurses' Association, appointed by the Regents of the University of the State of New York. They grant certificates which may be revoked for sufficient cause, after written notice to the holder, and no person is allowed to practise as a registered nurse after such certificate has been revoked. The law in the other States is virtually the same as in New York. The best-known training schools are those connected with the Bellevue, Presbyterian, Mount Sinai and City Hospital in New York City; the Massachusetts General Hospital in Boston; Philadelphia and Pennsylvania hospitals in Philadelphia; Johns Hopkins Hospital in Baltimore and the Illinois Training School for Nurses, Chicago. The first class of young negro women ever graduated as trained nurses was sent from the Lincoln Hospital and Home, New York City, in December 1903. For provisions of the State laws consult Body, L. C., 'State Registration for Nurses' (Philadelphia 1911). Consult also Goodnow, Minnie, 'Outlines of Nursing History' (Philadelphia 1916).

NURSE-FROG, any of various frogs and tree-frogs which have or make special arrangements for the care of the eggs or young, or of both. The most widely known example is probably the European obstetrical frog, the male of which takes charge of the eggs as soon as laid by the female, and carries them with him until they hatch. Many other species, especially among those living in the American tropics, take precautions as to their offspring. Thus one, the Brazilian ferreiro (*Hyla faber*), makes beneath the water in the ponds where it goes to spawn small walled-in basins of mud, within which the spawn is deposited and the tadpoles are reared in safety from many enemies that would attack them were they running at large. Several kinds of frogs have their few eggs placed upon the back of the female, in pits or pouches in the skin, and keep them there until they hatch; and in one well-known genus (*Phylllobates*) the tadpoles cling to the mother's back and are carried about and cared for until able to transform and care for themselves. Consult Gadnow, 'Amphibia and Reptiles' (1902). See FROG.

NURSE-SHARK, a name given by American fishermen to several different kinds of shark, as the Sleeper (*Somniosus microcephalus*), and especially a voracious tropical shark (*Ginglymostoma cirratum*) abundant about the coral reefs of the West Indies and the coast of Mexico, where it is called *gata*. The Port Jackson shark (*Cestracion*) is sometimes called nurse-shark.

NURSERY, properly speaking, any place in which plants are grown for transplanting. As used in America, however, florists' establishments have been excluded because they were developed later than the fruit nurseries and because their equipment is strikingly different. Since the development of nurseries in which ornamental plants such as herbaceous perennials are grown, the term has been gradually returning to its original meaning, for many nurseries now grow for sale all classes of plant materials—trees, shrubs, perennial herbs, "bedding stock" and even annuals.

As now constituted, the nursery business in

North America is a development of the past century and a quarter, for though there were some nurseries prior to 1800, they were few, small and local in their influence. With the development of fruit growing, especially in New York State, about the time of the opening of the Erie Canal in 1825, the nursery industry began to grow both in extent and influence. Until about 1860 the development of the business was mainly westward from New England to New Jersey and to Michigan and Illinois. After the Civil War the industry began to spread southward and southwestward until now practically every State has its nurseries.

On the Pacific Coast, especially in California, the mission fathers had their small nurseries, but not until agriculture began to rank in importance with mining were commercial nurseries established in these States. To-day some of the largest and most important ones are located in California, but New York still leads in this industry, its centre during the past 75 years continuing to be at Rochester.

Indexes of the relative importance of the industry are afforded by the 13th United States Census Report, which shows about 2,500 nurseries, representing an aggregate value of \$20,600,000 and an area of 80,600 acres. During the decade since the previous census the value of the product had more than doubled, being over \$21,000,000 in 1909. Of this amount New York contributed more than \$2,700,000, California \$2,100,000 and Texas \$1,200,000. Extensive nursery interests are also centred in Maryland, Florida, Michigan, Missouri, Georgia, Alabama, Tennessee, Ohio, Arkansas and Kansas.

In America nursery methods differ widely from those of Europe. They have mainly to do with extensive rather than intensive practices, the growing of large numbers of specimens for commercial ventures, instead of specially trained specimens for amateur plantings. This statement applies particularly to fruit trees, which in America are planted far apart, whereas in Europe they are more popularly grown upon walls and trellises or as cordons and espaliers in greatly restricted quarters. American nurserymen are interested in growing straight stemmed fruit trees in uniform rows, each specimen being as nearly as possible a replica of every other of its kind.

While berry bushes such as currant and gooseberry are grown from cuttings, and others (raspberries, blackberries, etc.) are reproduced by means of "tips" and "suckers," the tree fruits are propagated by grafting or budding. (See GRAFTAGE). Any of these method, depending upon the species or the variety, may be used for reproducing ornamental trees and shrubs. Forestry subjects are generally grown from seeds. They often demand great care and skill in the handling of the seeds and of the seedlings. Formerly piece root grafting was the most popular method of propagating apples and pears in the Eastern States. In some sections it is still in vogue, but as in the case of the stone fruits, such as peaches and cherries, budding is steadily replacing it. In the Middle West small pieces of root are advocated not so much because they permit the growing of several trees from the one stock, but because the "piece" merely serves to nurse the scion until this develops

roots of its own and thus the trees attain greater hardiness than might otherwise be the case. Experiments tried in various States seem to indicate that otherwise there is little advantage gained by budding over grafting, or long pieces over short ones except in convenience and speed of handling. In some cases nurseries practise "double working" to avoid the damage to weak trees, for instance, Tompkins King and Grimes Golden apple from diseases such as collar rot, these varieties being worked upon resistant stems such as Ben Davis or Northern Spy.

To supply the general nurseries with stocks upon which to graft or bud the various named varieties of fruit and ornamental trees, specialists have arisen during the past 20 years, so that to-day the nurseryman who grows his own grafting or budding stocks from seeds other than peaches is the rare exception.

Prior to the Great War practically all the pear, cherry, quince and many other stocks were imported from France. But the war almost destroyed that industry, so American nurseries and the fruit industry have both seriously suffered in consequence. The Prairie States furnish the great bulk of the apple stocks, the work being in the hands of men who sow the seeds in rows, cultivate the seedlings like carrots or beans, dig the plants after the leaves have fallen in autumn and sell them to those nurserymen who use them for grafting during the winter or budding the following summer. With the peach the case is different; each nurseryman sows each spring seeds for what trees he needs and during the summer buds them. An interesting fact in this connection characterized the last year of the Great War and the succeeding season; namely, that whereas American nurserymen were often unable to supply desired varieties of apples, pears, cherries and other fruit trees, due mainly to shortage of stocks, they usually had complete lists of varieties and adequate supplies of peach trees simply because they grew the seedlings themselves.

Because many diseases and insects cause serious damage to nursery stock, special State and national legislation has been passed to control the dissemination of stock and provide for quarantine of imported plants, both interstate and international. Under provisions of various acts inspectors are placed at ports of entry to scrutinize imports of nursery stock, pass "safe" shipments and condemn and destroy such as are infested with disease and insects. Had such inspection been established early enough, many of the pests imported from foreign countries, especially Europe, might have been kept out and losses amounting to millions of dollars thus prevented. See INSECTS OF IMPORTANCE TO MAN; also PLANTS, DISEASES OF.

While insects and diseases make production of nursery stock difficult the most important restricting factor is the necessity to use land that has not grown trees oftener than once in five years. The trouble is apparently not chemical but physical, the main reason being that the land is under crop for several years and is handled when it should be left untouched. The humus becomes depleted, even exhausted, so several years of rest in clover or grass are necessary to put the soil in good condition again.

In America special nursery tools have been developed to economize time and effort and thus make the industry more profitable. Among these are various knives for grafting and budding, hoes for planting, spades with reinforced metal handles for digging, plows and subsoilers for preparing the land and apparatus for spraying two or more rows at a time. But most important of all are the tree diggers operated by 8 to 16 horses, by traction engines or by stationary engines which use steel wire cables wound on drums to draw them from end to end of the rows.

In the north eastern United States and adjacent Canada nursery stock of fruit trees, grape vines and bushes, also of many ornamentals, is dug in the autumn and stored in frostproof buildings, the best of which somewhat resemble cold storage houses. The main advantages of such storage are that damage by mice and rabbits and winter injury by frost are prevented and the nurseryman is permitted to pack and ship stock earlier in the spring than would be the case were the stock left out of doors during the winter. Unless the temperature is kept at 28° to 34° Fahrenheit there is considerable risk of damage either by freezing if below this range or by mildew if above; also there is risk of drying out of roots and tops so that when the stock reaches the purchaser it may be lacking seriously in vitality. Thus the practice of winter storage favors the nurseryman more than the planter. Hence the advantage to the latter of ordering dormant stock for fall delivery, whether he plants in the autumn or merely "heels in" or buries the stock until spring.

Nursery interests in the United States and Canada are represented by several sectional organizations and the whole area by the American Association of Nurserymen which meets annually in various parts of the country and publishes an annual report. *The National Nurseryman* is a monthly magazine devoted to the industry and published at Rochester, N. Y. American books which deal with the propagation phases of the business are Fuller, 'Propagation of Plants' (New York 1887); Bailey, 'The Nursery Book' (New York, 11th ed., 1907), and Kains, 'Plant Propagation, Greenhouse and Nursery Practise' (New York 1916).

M. G. KAINS,

Horticultural Consultant.

NURSERY FOR CHILDREN, Hygiene of the. There is no part of the home requiring more particular and intelligent care with respect to the conditions of health than that which is assigned to the children of a household. The children's apartment should be a large, sunny, dry and well-ventilated room. Absence of sunlight is as bad for children as plants—both grow pale and sickly in consequence of it. Excess of sunlight can be averted by blinds, awnings or dark-colored (preferably green) window-shades. The room should be above the first floor, in a well-built house, on dry ground, and should have good plumbing. The furniture of a nursery should be comfortable, but simple and easily cleaned. The floor is best covered with a carpet or rug which can be readily removed for cleansing or when a contagious illness prevails. The walls should be either painted (preferably a light gray), varnished or

covered with a varnished paper which can be washed. Dirt must be kept out of the nursery. There should be no heavy furniture. All cupboards and closets should be kept clean and well aired. There should be no "tuck-away" places. Dusting, as ordinarily carried out—that is, the transferring of dust from one place to another—should be unknown. Dust should be removed by hand, with a slightly moistened piece of cheese-cloth, and with the cloth fastened in a metal grasp fitted to the end of a pole made for that purpose. The floor should be swept after moistened tea leaves or sawdust have been sprinkled over it, or better yet, with a vacuum cleaner. The corners of the room should be rounded so that no dust can lodge in them.

Ventilation and Warming.—While a nursery should be always comfortably warm, it should be well aired or ventilated and fresh air must come from out of doors. Few houses are equipped with such a good system of heating and ventilation that the opening of a window to admit air is not necessary. But cold air should not blow upon the child. In fact, in cold weather children should not be allowed to stay near a window, even if closed, as it is the cold air that comes through crevices that "cuts like a knife." As the current of cool air is greatest along the floor of a room, in cold weather children should not sit upon the floor. The room may be frequently ventilated by opening a window for a short time at the top, the children meanwhile being more warmly clad. Or the air may be admitted through an elbow tube or through the space between the upper and lower sash, the lower sash being raised several inches and having under it, along its entire length, a board (window-board). A stout piece of cloth, decorated if desired, may be fastened across the lower part of the window, with the window raised nearly to the upper edge of the cloth, the air comes tempered through the cloth and also between the upper and lower sash. The upper sash may be lowered a few inches and a frame covered with one or more layers of cloth fitted in between the sash and the window-frame. As lamp and gas light readily pollute the air of a room, electric light is preferable.

The temperature of a nursery should be from 65° to 70° F. Open fire-places or hot-water pipes are frequently better for heating purposes than close stoves or furnaces, which unduly dry the air. If close stoves are used they should have no dampers, because of the danger of coal-gas permeating the air of the room. All heating and lighting apparatus should be well protected, so that children cannot burn themselves or set fire to anything.

Nuisances and Sources of Contamination.—There should be no imperfect plumbing in the nursery—in fact all plumbing would better be in an adjacent room. Soiled napkins and other offensive articles should be promptly removed from the nursery, also remnants of food. Toys should, as far as possible, be unpainted and clean. Disinfectants are rarely needed, except in cases of sickness, if sunlight, good air and cleanliness are secured.

Toilet.—While a warm bath, with the occasional use of a pure soap and thorough drying, is necessary, the child should become accustomed to cool water. This can usually be

accomplished by gentle sponging with cool water after the use of warm water. A child does not always need a daily bath. Soft towels or cloths are best for drying purposes. Toilet-powders need not be used except where the skin remains moistened. Much of the soreness upon the buttocks and in the groins can be prevented by the use of dry, soft napkins, washed in soft water and with a soap containing little alkali. The scalp and teeth should be kept clean, and only soft brushes employed. A comb should rarely be used.

Dress.—This should be sufficiently warm, and as small in amount as is consistent with comfort. The underclothing is of the most importance and should be of woolen or linen mesh-work of varying degrees of thickness, depending on the seasons of the year. The fabric of children's clothing should be soft. Tight construction by bands is injurious. When a child begins to use its limbs freely the clothing should be shortened. Shoes should be soft, and for young children without heels, and should not cramp the toes.

Food.—The child's food should be well cooked and clean; the milk should be pure; if there is any doubt as to its purity it should be sterilized. Long-tubed nursing-bottles should not be used. All receptacles of food should be kept clean. Boiling and straining the drinking-water is frequently advisable. It should be cooled by placing it in corked bottles in the refrigerator. (See CHILDREN, DISEASES OF). Consult Dennett, R. H., 'The Healthy Baby' (New York 1912).

NURSERY LORE, songs and folklore of children. Nursery lore naturally divides itself into two distinct classes, the songs, rhymes and stories told from generation to generation in substantially the same form by older people, and the peculiar child lore handed on from one generation of children to another by the children themselves. The former include the vast body of nursery stories found recorded in books for the use of children, and the tales of mothers and nurses told to children. To the second division belong the songs, games and occasional stories which children habitually make use of in their play. Many of these are of great antiquity. The strongest faculty in the child is that of imitation. He lives over again in his games the occupations that interest his elders; and long after the latter has substituted newer interests and occupations for the older, the child continues to hand down to succeeding generations of children echoes of the past in the shape of imitations of these earlier activities of the human race. In the course of time these become conventionalized into an unchanging, meaningless form in which all memory of their origin is lost. These are repeated in the playroom, on the playground and wherever children meet together. The verse form of the songs and jingles helps to preserve them unchanged from year to year, and they, in their turn, aid in preserving the formulas of games which they accompany. These games, with their accompanying songs and formulas, were at one time the property of older people as well as of children, and some of them were dropped by the latter almost within the memory of persons still living. Out of the May dances and other ceremonial ob-

servances of a like nature, dating back to the days of a widely extended nature worship, sprang many later sports and celebrations, after the Christianized peoples had forgotten their former beliefs but had not yet altogether abandoned the more striking of the ceremonies connected therewith. These form a most curious and interesting survival of the manners and customs of tribes and peoples. In them are mingled and, as it were, jumbled together history, love games, flower oracles, rhymed formulas, striking alliterations and assonances, pleasing jingles, cadences and songs with refrains or choruses. The memory of the dead past that inspired them is gone; but the charm of music and of simple refrain has survived in a luxuriant growth of what appears pure senseless sound, beautified by the freshness, simplicity and earnestness of child nature.

Games.—When books and other reading material were not so plentiful as now, when means of communication were poor, and when people found few sources of public entertainment outside their own homes and those of their relatives and friends, then formal square dances, charades and games of many kinds were very popular and formed a part of every entertainment where young, middle-aged and even older people were met together for social ends. These games, some at least of which had a mythological origin probably of remote antiquity, were originally played to the accompanying of rhymed formulas, singing, and later to the sound of musical instruments in the case of the country dances. These rural entertainments included guessing games, dances, counting games, sports of such a nature that the youth of both sexes might take part in them, choruses (carols), riddles, games of hide and seek and pure nonsense contests. These were all imitated by the children in their play. The same thing may be seen to-day in Russia, Hungary, parts of Germany and Austria where the peasantry has preserved its more rural and primitive aspects. Among the American Indians, but a generation ago, the children imitated, in their games, the sports and ceremonies of their elders. In parts of Latin America, notably Mexico, the nine days preceding Christmas are given over to entertainment in which a memory of the "novenas" is the leading feature. (See POSADAS). The children imitate these semi-sports, semi-religious formulas at school, in the streets and at home, performing them exactly as their elders do; and often they continue them for several days after the "novenas" are past, probably because the constant movement and the music please them. In all of these there is in evidence the process through which the ancient folk ceremonies passed in becoming nursery lore.

Nursery lore, like everything human, has been subject to many changes stretching over long periods of time. Rhymes, choruses and tales have been detached from one connection and attached to another; and folklore has grown up about certain mythological personages and historical characters, giving us very distinct and abiding notions of them. Every child and older person, for that matter, knows that King Arthur was a goodly king, old King Cole was a merry old soul, Queen Guinevere was skilled in the baking of cakes,

Queen Anne once ruled the land (England), Georgey Porgey, the German Prince who reigned in England, was fond of pudding and pie, and that the merry Charley (the Stuart) loved good ale and wine. Many of us, too, remember that other luckless Charles of our childhood days, who went about, in our imagination, upon a black horse, and the James who had a daughter which he gave to the Oranger, only to be driven out of his kingdom by the two of them. All these more modern characters have been dressed up in ancient rhymes just as were Arthur and the chivalrous characters of his age. In the games and rhymes of children we still hear a curious echo of this burning past of English history, when the events chanted therein went to every true man's heart. The scurrilous songs sung by the Stuart adherents about the house of Guelph during the reign of the first four Georges is reflected in the rhyme showing that the Georgey Porgey already referred to "Kissed the girls and made them cry". Many a young girl cried and many a household mourned on account of the profligate character of members of the families of these early German sovereigns of England. Yet it is curious to have the echo of this non-moral age come down to us in the mouths of innocent children and to have it hobnobbing with "Poor Old Robinson Crusoe," the athletic cow who jumped over the moon, or the dish that purloined the spoon.

Cradle Songs are to be found in the lore of nearly all races; and they are undoubtedly of great antiquity. The North American Indian possesses some of the most beautiful of these lullabies. The structure of the latter gives an indication of how they were originally composed. If the child cried and remained awake past his natural bedtime, the assumption of primitive people was that he was being troubled by some spirit. Incantations and choruses were at once resorted to in order to free the infant from his unwelcome visitor. The more powerful the charm the more likely was the child to soon fall asleep. Practically all the Indian races had songs of this character, living examples of which are still to be found in current use among the Pueblo Indians and the native races of Mexico, Central America, Colombia and Venezuela. As the charm idea grew more and more obscured with the imposition of Christianity upon paganism, the lullabies assumed a more human and personal tone. Side by side with these humanized lullabies existed tales of changelings and bewitched children which continued to form a part of nursery lore in most countries until comparatively recent years. When children became ill, it was believed they were being troubled by some evil spirit, and songs, charms and incantations were resorted to to scare them away from the child or to induce them to leave it. In the course of time these, too, became lullabies in a modified form.

Riddles.—These are as old as the literature and ritual of races. We find them constantly appearing in biblical and other literatures in connections that show they played an important part in the life of the people from the highest to the lowest. The gods, the oracles, the prophets, the priests and the rulers frequently spoke in riddles and myths, and adventurers

and heroes are represented as propounding riddles to those high in authority. Oracular language was used in connection with almost every phase of life in its relation to religious ceremonies. It is but natural, therefore, that many of these should have survived among other superstitions of the past. They are found curiously intermingled with surviving child lore, often in a form that still reveals their ancient connections.

Charms entered into almost every phase of belief, every relationship of life, and, in the greater part of the world, belief in them has not yet altogether disappeared. They were used to cure every form of disease, to induce love, to drive out evil spirits, to scare away witches and wizards, to make butter come, to render fields, cattle and women fruitful. In the olden days they were of fearful import, and only priests and those empowered to handle them might lawfully use them. Those found using them without this authorization might be drowned, buried or otherwise put to death as a menace to the people. The old charms of making butter, milking a cow to an incantation and the driving away of witches are survivals, among others, of charms whose efficacy was once universally believed in. As already indicated, to this class belonged the lullabies or cradle songs which were, at one time, quite numerous. Many ancient prayers took the form of charms, as, for instance, in the nursery rhyme "Mathew, Mark, Luke and John guard the bed that I lie on," or "Mathew, Mark, Luke and John saddle the horse, and I'll get on!" ("I'll be gone"), and other variants: "Hickup, hickup, go away, come again another day!" The first invocation was to the saints, though it was probably of an earlier origin, while the latter invocation was to the thing itself which was creating the trouble. "Rock-a-bye baby, thy cradle is green," "Hush-a-bye baby, on the tree top!" and "Bye, bye, Baby Bunting, Father's gone a hunting," all point to a charm origin when conditions of society were vastly different from what they are to-day. Among the Pueblo Indians are very many stories in which the plot exists by virtue of some charm which is finally effective in saving the hero of the tale. These stories are in the transition stage when they please children and older people alike, as they are intended to. The Pueblos also possess many similar tales which are avowedly for the entertainment of the children.

Accumulative Stories are tales that keep adding to the original incident as the story proceeds, as "Old Mother Hubbard," "The house that Jack built." Sometimes each incident is repeated and a new one added until the end is reached; while in other tales these repetitions are avoided. These tales take many forms; some are short and some are quite long. Of the longer ones there are generally several versions with variations. Though they may be of considerable antiquity most of these stories seem to be tales of pure invention. This, in itself, would explain the many variants of such tales.

Proverbs and Refrains.—A large class of nursery rhymes in a sense may be called riddles. Of this class are "Humpty Dumpty," "The ship-sailing on the sea," "Little Nancy Red-head and white toes, the longer she stands the shorter she grows" (a candle), "Old mother Twitchell

who has but one eye," and "Higgledy, Piggledy, here we lie, plucked and picked and put in a pie." Closely allied to these are many tales that seem to be largely nonsense with a goodly mixture of humor. There is the hen who crossed the road to get to the other side, and "Peter White who never went right because he followed his nose and that was always awry," the piper who had a cow and no hay to give so he took his pipes and played "Consider, good cow, consider." In another closely related group of nursery rhymes a proverb is presented instead of a riddle. Many of these are undoubtedly of very ancient origin and mythological connection and signification. To these belong such sayings as "See a pin and pick it up, all the day you'll have good luck"; "Monday's child is fair of face, Tuesday's child is full of grace, etc." "The child that is born on a Sabbath day is bonny and blithe and good and gay." This takes us back to the pre-Christian days when children born on the day of the Sun were supposed to be under his protection and, subject, for this reason, to very favorable influences. All the other references in the nursery rhyme can be traced to pre-Christian beliefs in the character of the various gods after whom the days of the week were named. Sneezing was generally a sign of ill luck, but it was especially so on Friday. This old superstition survives in many countries. If you sneeze the German wishes you good health, and most of the Latin nations invoke the name of Jesus (for your protection). About this belief have grown up various nursery rhymes, many of which seem to be used purely in a proverbial sense. To these belongs such advisory verse as "He who would thrive must rise at five"; "A stitch in time saves nine" and "For every evil under the sun there's a remedy or there's none."

Some nursery rhymes are essentially dramatic in form. To these belong the good Doctor Faustus who whipped his scholars out of Scotland into France and out of France into Spain and into Scotland whipped them back again; "The man in the moon who came tumbling down and asked his way to Norwich town," "The Crooked man who went a crooked mile"; "Bryan O'Lin, his wife and his mother who all went over the bridge together"; old Mother Goose who whenever she wanted to wander, used to ride on a very fine gander; and the old woman who went up in a basket to brush the cobwebs off the sky. Of another kind, of a no less dramatic quality, are the sentimental stories of Billy Pringle, Cock Robin and Jenny Wren; the lady bug whose house was on fire. These all run into the tragic. More cheerful is the story of the hen that washed the dishes, baked the bread, scrubbed the floor and ran errands; and there's a distinctly joyful note in the tale of the little girl who gathered roses and took them to the queen and received in return a diamond as big as her shoe.

JOHN HUBERT CORNYN,
Birmingham Southern College.

NUS, Eugène, è-zhèn nūs, French dramatist: b. Châlons-sur-Saône, France, 1816; d. 1894. He was an ardent Socialist, and his first success as a dramatist was with his 'Jacques le Corsaire' (1844). Among his works are 'L'Enseignement mutuel' (with Desnoyer, 1846); 'Le Vicaire de Wakefield' (1849); 'La tour de Londres' (with Brot and Lemaitre, 1855), all dramas; and 'Les dogmes nouveaux' (1861); 'La république naturaliste' (1862); 'Lettre à Emile Zola' (1879); 'Choses de l'autre Monde' (1880); 'Ala recherche des destinées' (1891); 'Vivisection du Catholicisme' (1894), etc.

NUSHAGAK (noo'shā-gāk) **BAY**, Alaska, practically an extension of Bristol Bay. It is noted for its salmon fisheries. The annual catch varies from nearly 3,000,000 to 6,100,000. Since 1907 the government has protected the tributary streams, Nushagak and Wood, the spawning-grounds of the salmon. The native settlements of Chogiung, Nushagak and Kakanak are situated on the shores of Nushagak Bay and all are provided with government schools.

NUSKU, noos'koo, in Assyrian mythology, a solar deity who afterward became a fire god. He was regarded as a messenger of the gods.

NUSLE, noos'lyě, Austria, town in the Crownland of Bohemia, the southeastern suburb of Prague. A castle and park are the chief features. Candles, soap and cocoa-fibre mats are produced here. Pop., including the village of Pankratz, 53,000.

NUSSBAUM, noos'bowm, **Johann Nepomuk**, German surgeon: b. Munich, Bavaria, 2 Sept. 1829; d. there, 31 Oct. 1890. He studied in Munich, Würzburg, Berlin and Paris, and in 1860 became professor at the University of Munich. He published 'Die Pathologie und Therapie der Ankylosen' (1862); 'Die Verletzungen des Unterleibs' (1880); 'Ueber Chloroformwirkung' (1885), etc.

NUT, noot, in Egyptian mythology, the goddess of the sky, wife of Keb, the god of earth.

NUT, a piece of metal tapped and adapted to be screwed on the end of a butt. It is used for many purposes, but especially on the end of a screw-bolt, in order to keep it firmly in its place.

NUT BROWN MAID, The, an old English ballad, the earliest extant form of which is found in Arnolde's 'Chronicle' (1502). It is based on the legendary story of Henry Clifford, known as "The Shepherd Lord." Consult Percy, 'Reliques,' series 2, book i, 6.

NUT-GALL, a hard, nut-like gall (q.v.), especially those from the Asiatic oaks, used in ink-making and for other purposes. The Chinese and Japanese nut-galls of commerce, however, are from species of *Rhus*, and are large and very irregular in form. They contain from 30 to 60 per cent of tannin, and are the source of gallic acid ($C_6H_2(OH)_3COOH$) which appears in white silky needles, soluble in alcohol, less so in ether and sparingly soluble in cold water; it is precipitated blue-black by ferric salts, the color disappearing on boiling, and is not affected by gelatine, except in the presence of gum. Consult Maisch, 'Materia Medica' (2d ed., 1885).

NUT-GRASS, or **CHUFA**, a sedge of the genus *Cyperus*, especially *C. esculentus*, of the Eastern and Southern States, whose root-stocks bear small tubers, like nuts, which are edible to man, and of good flavor when roasted, and which are highly nutritious to hogs who eagerly search for them. Consequently these sedges are planted in some parts of the country as a food-crop for swine. An oil may be expressed from these tubers, or "ground-almonds," which is an excellent substitute for olive-oil for table use.

NUT-LOCK, a means for fastening a bolt-nut in place preventing its becoming loose by the jarring or tremulous motion of the machinery. Such are used upon fish-plates of railways, upon harvesters, etc.

NUT-WEEVIL, a snout-beetle of the genus *Balaninus*, which deposits an egg in the kernel of a nut, when it is young, where the egg hatches and the grub feeds until the kernel is destroyed, when it bores its way out through the shell. Several species infest the various commercial nuts.

NUTATION, a slight change in the direction of the earth's axis produced by the same cause as the precession of the equinoxes, namely, the attraction of the sun and moon upon the equatorial protuberances of the earth. If the orbits of the earth and moon were circular and in the same plane, the motion of precession, which consists in a slight revolution of the direction of the earth's axis in a period of about 266 years, would be regular and uniform. But, owing to the inclination of the orbits, and the revolution of the moon's node, the real direction of the axis of the earth revolves in a small circle around its mean direction in a period the same as that of the moon's node, namely—18.6 years. Bradley discovered and explained nutation not long after his discovery of the aberration of the fixed stars.

NUTATION IN PLANTS. The word comes from the Latin *nutatio*, a nodding, and in pathology is defined as "a constant nodding or oscillation of the head by which it moves involuntarily in one or more directions." The word has a more extended meaning in plant life for it defines the various movements executed by organs—such as stems, leaves, roots and tendrils by which the organ is inclined successively in various directions. Nutation is due to the unequal rate of growth on different sides of the organ. Nutation is, therefore, one of the problems of growth as well as of movement. Sachs, in 1873, restricted the term nutation to the movements of the apex produced by

growth. Frank had previously (1868) applied it to growth movements which result from external influences. Baranetzky (1883) associated circumnutation with the influence of gravity and Darwin (1880) asserted that "circumnutation is universal in all growing organs." Nutation is one of the problems of the movements of plants (phytodynamics) upon which botanists and physiologists are engaged, for phytodynamics is one of the most important foundations of vegetable physiology. Consult Sachs' 'History of Botany,' trans. by Garnsey and Balfour (Oxford 1890), pp. 535-563; Green, J. R., 'A History of Botany,' continuation of Sachs (Oxford 1909), pp. 445-457).

NUTCRACKER, the English name of a species of crow (*Nucifraga caryocatactes*) found ranging over a wide area in the pine forests of northern and sub-Alpine Europe and Asia. It is dull brown, thickly speckled with white spots and is about the size of a jay. The nutcracker is gregarious, wandering in bands of 50 or 100 in the autumn, but scattering to remote regions and becoming silent during the breeding season. Its chief food is nuts and seeds of conifers. It is said to hold nuts and cones with its foot and to extract the kernels by repeated blows of the bill.

A closely related American bird is Clark's crow (*Picicorvus columbianus*), discovered by the Lewis and Clark expedition in 1804-06. It is about one foot long, of a generally gray color, the wings and tail black with large white areas. It inhabits the coniferous belt of the Rocky Mountain slopes and congregates in great flocks, which rove in search of food. The well-concealed nest is built in the tops of pine trees in the highest mountain ranges. Consult Coues, 'Birds of the Northwest' (1874).

NUTHATCHES, small passerine birds forming the family *Sittidae*, related to the titmice, from which, and from the creepers, they are readily distinguished by the long, straight, slender bill. The typical genus (*Sitta*), with about 15 species, is confined to North America, Europe and Asia, but some related genera are found in the southern hemisphere. In the United States we have four species and several sub-species. The common resident eastern species (*S. carolinensis*) is nearly six inches long and has the under parts white, but is blue on top, and has a green-back crown. The red-bellied nuthatch (*S. canadensis*) is an inch shorter, with the under parts rusty brown and the glossy black cap cut by a pure white stripe on each side. This is a migrant species, which breeds in the Northern States and Canada and on mountain tops, but in winter extends its range to the Gulf Coast. Two still smaller species, the brown-headed nuthatch (*S. pusilla*) and the pigmy nuthatch (*S. pygmaea*), are respectively southern and far western. Both have the crown brown, not black, as in the other two species, and *S. pygmaea*, which is only four inches long, may be distinguished by the black and white markings on the middle tail-feathers, which are plain in *S. pusilla*. The habits of all are similar. They spend their time in traveling restlessly up and down the trunks and limbs of trees in the most nimble manner, hanging in any attitude supported by their strong, large feet alone and without the assistance of the tail. Consequently they display greater freedom of movement than either the woodpeckers or the

creepers. Their food consists chiefly of insects and their eggs. In the autumn and winter they have the habit of wedging acorns and nuts firmly in crevices, and hacking them with the bill till they break open; this is done partly for the kernels and partly for the grubs which they frequently contain. From this habit the common name is derived. Their only note is a hoarse call. They nest in holes in trees, often in crevices beneath bark, and lay four to eight speckled eggs.

NUTLEY, N. J., town in Essex County, five miles north of Newark and eight miles south of Paterson. The town was settled in 1680 and has several picturesque old colonial Dutch stone houses. Nutley was included in the Newark Patent of 1713 and when the townships were formed it became part of Bloomfield in 1812, part of Belleville in 1874, was formed into the Franklin township in 1882 and finally in 1902 it was incorporated as the town of Nutley. Nutley is practically a residential suburb of New York and contains many handsome houses. It possesses a Carnegie library, the Nutley School and an attractive high-school building. The chief industries are paper and woolen mills. In 1912 the commission form of government was adopted. Pop. (1920) 9,421.

NUTMEG, the hard kernel of the fruit of various species of *Myristica*, especially *M. fragrans* or *moschata*, of the order *Myristicaceæ*. The common nutmeg tree grows about 25 feet high, bears oblong, entire leaves, axillary racemes of small flowers, followed by golden yellow pear-shaped fruits which split in halves, exposing the kernel surrounded by a false aril which forms the mace (q.v.) of commerce. The fleshy halves of the fruit are used as preserves in countries where the trees are cultivated. Various species are cultivated in the tropics, particularly the East Indies, West Indies and Brazil. They are among the most important spices as which they are chiefly used. A fatty oil called oil of mace is expressed from the seed, and a nearly colorless essential oil is obtained by distillation. The tree thrives in the West Indies up to elevations of 2,000 feet, but is less productive there than at lower altitudes. It does best in a well-drained, rich loam, in warm, protected valleys.

NUTMEG-BIRD, a name among bird-dealers for an East Indian mynas (*Munia undulata*), also known as cowry-bird; it is brown, with white streaks above and spots below, a yellow rump and a white middle to the under parts. An Eastern fruit pigeon (genus *Myristicivora*) is also so called, because it feeds upon the nutmeg fruit.

NUTMEG MELON. See **MELONS**.

NUTMEG STATE, a popular name for the State of Connecticut, derived from the alleged ingenuity of Yankee inventors who were facetiously charged with manufacturing wooden nutmegs to be sold as genuine.

NUTRIA. See **COYPU**.

NUTRITION OF FARM ANIMALS, *The*. The common domestic animals are fed for a variety of purposes. With cattle, sheep and pigs it is the object to induce gains in weight, that is, to fatten them, or in the case of milk cows, to produce gains in the form of body secretion—milk, rather than fat on the

body. In a similar way, sheep are fed for the production of wool; goats for milk or their fleece, and poultry for the market and the production of eggs. Cattle are sometimes, and horses are almost universally, fed as beasts of burden. Animals with young require food for their development and after birth the young animal needs it for growth and the development of the body as well as for maintenance.

A great deal of information regarding food requirements has accumulated from the experience of countless generations and for many years the problem has been studied experimentally at agricultural colleges, experiment stations and similar institutions, in this and other countries. It is fair to say, at the present time, that the feeding of farm animals rests upon quite well-defined general principles, derived from the studies of the chemist and the animal physiologist, concerning the composition and functions of food and the way it is utilized after it is eaten. Such studies show that the materials composing the body are constantly breaking down and being consumed and that to keep the animal in a healthy and vigorous condition requires a constant supply of new material; if this is lacking or is insufficient, hunger and finally death result. To supply the needed materials for growth, maintenance and repair is one of the chief functions of food, but in addition to this it maintains body temperature and also furnishes the force or energy which enables the animal to do work, including that pertaining to the necessary functions of the body, such as keeping up the beating of the heart, the respiratory movements and so on. Since it furnishes heat and energy, the food may be said to serve as fuel. If, in addition to maintaining the system, growth is made, as in case of a young animal, or milk is secreted, more food is needed than for maintenance. If the supply is in excess of all demands, some is stored as a reserve material, principally in the form of fat. To supply food in the right proportions to meet the various requirements, without waste, constitutes scientific feeding. By carefully studying the composition of feeding-stuffs, the proportion in which they are digested and the requirements of different animals when at rest, at work, producing wool, giving milk, etc., the principles of feeding have been deduced. In applying these in practice, the cost and special adaptations of different feeding-stuffs must also be taken into account.

The animal body and the different feeding-stuffs which nourish it are all made up of a comparatively few chemical compounds, namely, water, ash or mineral matter, and the so-called nutrients, protein, fats and carbohydrates, the carbohydrates being subdivided into two groups, namely, "nitrogen free extract," that is, sugars, starches, etc., and "crude fibre." Of these protein is the only nutrient which supplies nitrogen, the characteristic element of body tissue in the right form, and is, therefore, the only one which can truly serve for building and repairing the flesh and other nitrogen containing portions of the animal body. Mineral substances are also essential for tissue building as well as other purposes. Fats and carbohydrates serve as fuel and yield energy in the forms of heat and muscular power. Protein may also serve as a source of energy and thus has a two-fold function.

Water.—Water, though not a nutrient, is essential, being needed to dilute the blood and for other physiological purposes. All animals also require oxygen of the air for maintaining the life processes. Water constitutes from 40 to 60 per cent and ash from 2 to 5 per cent of the body; fat varies greatly with the condition of the animal, but seldom falls below 6 or rises above 30 per cent. The dry matter of the flesh, skin, bones, muscles, internal organs, brain and nerves, in short, all the working machinery of the body, is composed quite largely of protein.

Accessory Substances.—Recent investigations have indicated that in addition to the foregoing ingredients there are present in feeding-stuffs minute quantities of other substances, variously known as "vitamines," "accessory ingredients," "growth substances," "stimulating substances," etc. However, the prevailing opinion is that they are not substances with stimulating or some other special function, but that they are rather to be regarded as food constituents in the same sense as mineral matter and protein are food constituents and that, like them, they are indispensable for body growth and development. Their nature and function are not yet fully understood but it is known that their absence from the ration may constitute a limiting factor in growth, may influence reproduction or may lead to the development of specific diseases. Fortunately these substances are usu-

ally plentiful in the leafy portions of plants, and rations containing such materials as pasturage clover hay, alfalfa hay, corn fodder or corn silage are comparatively unlikely to prove deficient in this respect. See NUTRITION OF MAN for more extended discussion of nutrients.

Character of Food.—The feeding-stuffs of most importance for farm animals are of vegetable origin and include cereal grains; such as oats and corn, either ground or unground, and the milling by-products, such as middlings and bran; leguminous seeds, as beans, peas and cow-peas; oil cakes and other commercial by-products, as linseed-oil cake, cotton-seed meal, gluten feed and so on; fodder crops, fresh and cured; and the different roots, tubers and green vegetables. In quite recent times, cane molasses, beet molasses and other beet-sugar by-products have also assumed more or less importance in this connection. As regards feeding-stuffs of animal origin, milk is the natural food of the young of all mammals. After weaning, skim-milk is a common food, especially for pigs. Dried blood, meat meal and similar feeds of animal origin are also sometimes fed. The composition of a number of the more important feeding-stuffs may be seen by reference to the subjoined table, which shows the average composition as determined by analysis and also the digestible nutrients furnished by each 100 pounds of the feeding-stuffs.

It will be seen that the cereal grains resem-

TABLE I.—AVERAGE COMPOSITION OF A NUMBER OF FEEDING-STUFFS.

a Largely non-albuminoid nitrogenous materials.

b Very largely sugars.

ble one another quite closely in composition, being characterized by a fairly low water content and a considerable amount of protein and nitrogen-free extract. Some crude fibre derived largely from the outer or bran layer of the grain is also present. Bran, shorts, middlings and other by-products and cereal grains vary in composition, but all have a low water content while the crude fibre content is rather high, and the nutritive ingredients are principally protein and carbohydrates. The large proportion of crude fibre is due to the fact that these products represent the outer layers of the grain, which are more hard and firm in structure than the interior portion which consists quite largely of starch. Beans, peas and leguminous seeds resemble the cereal grains in having a low water content, though in general they furnish a higher percentage of protein. Such foods are known to be useful and valuable, but with the possible exception of cowpeas, they are not very commonly fed in the United States, although much used in Europe.

Concentrated Feeds.—The various cakes, gluten meals and similar feeding-stuffs are, generally speaking, commercial by-products. Thus, cotton-seed cake is the material left after the oil has been expressed from the cotton seed. In the same way linseed cake is the residue obtained from flaxseed in the manufacture of linseed oil. When these are ground they become cotton-seed meal and linseed meal. In the manufacture of beer the malted grain remaining is known as brewers' grains, and is best fed after drying. When starch is manufactured from corn, the nitrogenous portion of the grain is rejected and constitutes gluten feed and gluten meal. There are a number of mixed feeds on the market which are made up of shrunken grains, branny material and other residues obtained in the manufacture of cereal breakfast foods, etc. These vary in feeding value, some of them comparing favorably with more common cereal feeds. Grain, ground and unground, commercial by-products, leguminous seeds, oil cakes and similar products are very frequently called concentrated feeds, the name being suggested by the fact that their feeding value, especially the protein content, is high in comparison with the bulk. So far as the general experience and the result of American and foreign experiments go, most of the common feeding-stuffs in the group are wholesome and valuable.

Forage Crops.—The various forage crops—grass, clover, Kafir corn, corn, etc., all have a high water content when fresh, that is, they are more or less succulent and juicy. They contain, however, considerable nutritive material, chiefly protein and carbohydrates, and are valuable feeding-stuffs. The leguminous forage crops—alfalfa, clover, cowpeas, soy beans, vetch, etc.—are richer in protein than the grasses. When forage crops are dried and cured the resulting hay is richer in proportion to its bulk than the green material; in other words, it has been concentrated by the evaporation of the greater part of the water present. However, this is not the only change which has taken place. When hay is properly cured, it undergoes a peculiar sort of fermentation or oxidation materially affecting its composition,

improving the hay by diminishing the quantity of crude fibre and by increasing the relative amount of other nutrients, especially nitrogen-free extract. Hay which has undergone proper curing has a better flavor and agrees better with animals and is apparently more digestible than hay which has dried quickly in the sun without fermentation.

The feeding value of different forage crops, fresh and cured, depends in considerable degree upon the stage of growth, the nutritive value of the crop, generally speaking, increasing until the growth is complete and diminishing somewhat as the plants mature or become overripe. Straw, the fully ripened stalk of cereal grains, contains some nutritive material, but is less nutritious than the same portion of the plant cut before ripening. In the perfectly ripe condition the nutritive material, elaborated in different portions of the ordinary forage plants, has been largely conveyed to the seed and used for its development or stored as reserve material. Young animals get needed mineral matter from milk. Later forage crops, fresh and cured, are important sources of mineral matter, indispensable for growth, development and health.

Silage.—Green forage crops are frequently preserved by ensiling. In this process the material undergoes a peculiar oxidation which correspondingly changes it in composition and food value. Some of the carbohydrates are changed into alcohol, acetic and other acids, and crude fibre is undoubtedly softened somewhat, and possibly the silage is thus rendered more digestible. Bodies having peculiar flavor and odor are also formed. By far the most important crop ensiled is corn, but various sorghums are also satisfactorily used. Green cereals are less satisfactory, but some of the legumes may be employed, as well as such materials as beet pulp, beet tops, refuse from pea canneries, etc.

Roughage.—The green crops, hay, straw and other cured crops and silage, are frequently called "coarse fodder" or "roughage." This term is due to the fact that they contain a comparatively small amount of nutritive material and a high proportion of crude fibre as compared with their total bulk. Although pound for pound inferior to concentrated feeds in composition, they are an essential part of the ration of farm animals, capable of producing a large part of the total food material, as well as serving to give the required bulk to the food and being useful in other ways, among them their richness in the "accessory substances" previously referred to. It is believed that unless the food when taken into the stomach is comparatively bulky and the mass is more or less loose in structure, it is not readily acted on by the digestive juices.

The outcome of many experiments made with farm animals is in accord with the observation of careful feeders: namely, that the various common coarse fodders may be fed very largely as circumstances demand. Although timothy hay is still regarded, in some regions, and corn fodder in others, as the best coarse feed, yet experience has shown that both these feeds, corn silage, and also hays from the cereal grains and from clover and alfalfa, are all of great value.

Fresh herbage was, of course, the original food of domestic animals, and in early times natural pasturage was almost entirely depended upon to support them during a considerable part of the year. The importance of pasturage is still conceded, but the fact is also recognized that if, owing to drought or other cause, the supply is insufficient, other food will be needed. When green food is cut and fed fresh to farm animals, more or less confined, the practice is called "soiling," and is becoming quite prevalent, especially in older countries where land is expensive. Partial soiling is much more common, being relied upon to carry animals through the period when pastures are short. Under the soiling system, a larger number of animals can be kept upon a given acreage, and by allowing open air exercise in a large yard or pasture, the practice has been demonstrated as entirely feasible for dairying animals. On an average, carrots, Swedish turnips or rutabagas and other roots and tubers, green vegetables and fruits contain a high percentage of water and small amounts of the different classes of nutrients. The percentage of crude fibre is smaller than in the green forage crops; but since the proportion of nutritive material is small in comparison with the total bulk, they are ordinarily referred to as coarse fodder. The establishment of beet-sugar factories in this country has led to the production of immense quantities of sugar-beet pulp as a waste material, sometimes called "diffusion residue," or "beet chips," which consist of the residue of the beet after the extraction of the sugar under pressure in the diffusion batteries. This is used as feed. Sugar-beet molasses is another product of the beet-sugar manufacture which accumulates in large quantities, and both this and cane molasses are coming to be regarded as an important feed. It owes its value largely to the sugar in it.

Preparing Feed.—It is often claimed that cooking feed increases its palatability and digestibility. The general opinion drawn from experiments with farm animals is that this belief is not warranted and that the cost of cooking is not made up for by the increased value of the ration. Soaking feed, especially hard grain, renders it more easily masticated, and possibly increases its digestibility, but the general conclusion is that the importance of soaking feed for most farm animals is overestimated. Opinions differ as regards the advantages of grinding grain, but from the results obtained in a large number of tests with farm animals it does not appear that the superiority of ground over unground grain is sufficient to pay for the cost of grinding, provided the animals have good teeth and sufficient time to chew their food thoroughly. Chaffed or chopped coarse fodder occupies less space for storage than uncut hay or straw and can be readily handled. Shredding corn fodder is a useful practice, and more of the stalks and harder portions will be eaten than when fed whole, but for most farm animals in general the practice of cutting or chopping coarse fodder is much less followed in the United States than in Europe. Precaution should always be taken to avoid feeding-stuffs which are harmful in themselves or which become harmful. Dirt, small stones, etc., should be removed from grain by proper screening and all feeding-stuffs should be clean. Moldy feeds and those which are more or less

decomposed are unwholesome and may prove a cause of various diseases. Plants which are infested with ergot are also harmful. There are a number of plants which are poisonous to stock, such as rattlebox (*Crotalaria sagittalis*), loco weeds (*Astragalus* sps.), larkspur (*Delphinium* sps.), death camas (*Zygadenus venenosus*), water hemlock (*Cicuta* sp.), etc., and care should be taken to prevent animals from securing them. An explanation of the poisoning of stock by young sorghum and other green plants ordinarily wholesome is offered by the discovery of a peculiar glucosid, which with the aid of a special ferment, also present in the plants, liberates prussic acid. This is doubtless always present in at least minute traces, but apparently becomes dangerous when the plant is arrested in dry weather at certain stages of its growth. Sunlight such as prevails in the arid and semi-arid regions of the United States sometimes causes the development of the poison in excess.

Digestibility of Feeds.—The real value of any feeding-stuff is determined not alone by its composition, but also by its digestibility; that is, by the amount of material which it gives up to the body in its passage through the digestive tract. It is evident that if two feeding-stuffs have practically the same composition, but one gives up more material to the body than the other—that is, is more thoroughly digested—it must actually be more valuable than the other material. The bulk of the substance of almost all feeding-stuffs is insoluble when eaten or not in the right condition for body use. Material in solution can pass through the walls of the stomach and intestines into the circulation and be utilized by the body; therefore, digestibility consists chiefly in rendering insoluble materials soluble. This is effected by the aid of digestive ferments and also to a less extent by bacteria. The usual method of ascertaining the digestibility of a given material is to feed it for a longer or shorter time, the amount and composition being determined. From the total nutrients consumed, the amounts excreted undigested in the faeces are deducted, showing the amount of each retained in the body. It is the usual custom to express the amounts digested in percentages, the results thus obtained being termed coefficients of digestibility. As regards the results of digestion experiments with farm animals as a whole, it may be said that the percentage of protein digested is fairly high, being greater in grains and seeds than in hay or grasses. Generally speaking, the value obtained for the digestibility of fat is rather low, but there are reasons connected with the analytical methods commonly followed which render the results obtained with fat not altogether satisfactory. Nitrogen-free extract is quite thoroughly digested by farm animals, but crude fibre is much less thoroughly assimilated. Farm animals differ considerably as regards the thoroughness with which they digest their foods. It seems fair to say that, in general, ruminants digest a larger percentage of fats and carbohydrates, including crude fibre, than horses, the difference being most marked in the case of the crude fibre. Pigs ordinarily digest their food quite thoroughly. These results are in accord with what might be expected from differences in the digestive organs of the different classes or animals.

Food Requirements.—Attempts have been made to ascertain the food requirements of various kinds of farm animals under different circumstances, and large numbers of feeding experiments have been made under varying conditions with this end in view. From the results various feeding standards have been deducted which attempt to show the amounts of digestible protein, fat and carbohydrates supposed to be best adapted to different animals when kept for different purposes.

The feeding standards prepared by Wolff, a German investigator in animal nutrition, as well as their energy requirements, were formerly the most widely used of any. Wolff's standards have been modified by Lehmann, as the result of additional experiments and practical experience, and also in the attempt to adapt them more closely to the practical needs of the animal. A number of these standards are as follows:

statement of the amounts of the different nutrients required by animals, as indicated by the results of experiments and observation, and are intended to apply to the average conditions. No single standard can be laid down for all conditions, nor need a standard be adhered to arbitrarily. Good judgment and intelligent observation on the part of the feeder are also necessary.

The value of any ration which may be determined upon may be calculated with the aid of the feeding standard and the figures in Table I. Suppose four pounds of oats constitute one of the ingredients of a ration. According to the table, it is evident that if 100 pounds of oats furnish 9.25 pounds of digestible protein, one pound will furnish .0925, and four pounds will furnish .37000. In the same way, if 100 pounds of oats supply 124,760 calories of energy, one pound will furnish 1247.60 calories and four pounds will furnish 4990.40. The sums of the protein supplied by all the feeds show the

TABLE II.—WOLFF-LEHMANN FEEDING STANDARDS.
(Amounts of nutrients required per day per 1,000 pounds live weight)

ANIMAL	Total dry matter	Digestible nutrients			Fuel value
		Protein hydrates	Carbo-hydrates	Fat	
	Pounds	Pounds	Pounds	Pounds	Calories

Third period.....	25	2.7	18.0	0.4	40,200

Recent investigations of the experiment stations of this and other countries have shown that in some respects these standards, which are still much used, are inaccurate, and extensive modifications, calling especially for less protein, have been proposed by Henry and Morrison. Other standards, based on determinations of net energy values, have been proposed by Armsby for several kinds of livestock, and by Bull and Emmett for fattening lambs. In Denmark and other Scandinavian countries what is known as the "feed unit" system is used for measuring the relative efficiency of milk production by different herds and individual cows. Standards for dairy cows have also been formulated by Haecker, Woll and Humphrey, Savage and Eckles. Of special interest are Armsby's discussions of the economics of animal feeding from the standpoint of the conservation of food energy.

It should be borne in mind that the feeding standards are simply a concise and approximate

total amount in the ration, and so on, with all the other nutrients, and with the energy. In making such calculations, it is a common practice to consider only the protein and energy value since these factors show features of the food best understood and the calculation is somewhat simplified without materially lessening the value of the results. Too little is known as yet to warrant similar calculation for mineral substances and vitamins. It is believed that well-chosen rations as regards protein and energy will supply these needs also. It is not necessary that a ration should furnish each day the exact amount called for by a standard, but rather that it should approximate it through long periods, a slight deficiency at one time being made up by a corresponding excess at another.

In calculating rations it is essential that weights be used rather than measures. It is often inconvenient to weigh the grains, but the weight may be calculated with sufficient ac-

curacy by the figures given below, which show the weight of a quart of a number of common feeding-stuffs.

Some of these materials, especially by-products like wheat bran, vary considerably in weight, and the given figures cannot be regarded as strictly accurate. Weighing is, of course, always the safer way where it is desired to feed quite definite amounts. In selecting feeding-stuffs for his stock, the farmer will naturally be governed by the conditions of the market. The cost of feeding-stuffs is controlled by other factors than the actual amounts of food materials which they contain; indeed, there often appears to be very little connection between the two. Bearing in mind that the protein is the most expensive ingredient, and the one especially sought in concentrated feeds, the farmer can make his selection with the aid of such data as are given in Table I. Of course, the special adaptability of some materials to different kinds of animals and different purposes will also be taken into account.

Another important consideration where fertilizers or manures have to be relied upon is the manurial value of a feeding-stuff. If the manure is carefully preserved a large proportion of the fertilizing constituents of the feed is recovered in the manure and goes to enrich the land. See FERTILIZERS.

With respect to some feeds—the coarser grain products, for instance—which could be eaten either by man or by farm animals, it should be borne in mind that their fertilizer value would commonly be lost in the former case and saved in the latter, since house sewage is seldom and farm manure generally used for fertilizer.

Feeding-Stuff Inspection.—About three-fourths of the States have passed laws requiring that the composition of certain classes of feeding-stuffs be guaranteed by the manufacturer, and providing an inspection of these goods to see that the guaranty is complied with. In most cases the laws require that each package be labeled to show the protein and fat content, and often the maximum content of fibre. These laws in general apply only to the so-called concentrated feeding-stuffs, especially the by-products and mixed feeds, and not the cereal grains sold as such. The inspection is usually in charge of the Agricultural Experiment Station or the State Department of Agriculture and is managed very similarly to the fertilizer inspection. The need for this inspection arises from the quite wide variation

in the composition of many of the by-products, the confusion of names, as in the case of the by-products from starch manufacture, the large number of mixed feeds which are put upon the market under proprietary names, and the occasional tendency to mix with the material substances of inferior value. The feeding-stuff inspection protects the farmer from fraud in the same way as the fertilizer inspection, and gives him the benefit of a guaranteed composition in buying. The result of this inspection, which has been in operation a number of years, has been quite marked in driving inferior grades of goods, like adulterated cotton-seed meal, out of the market, and tending to bring about greater uniformity in composition in the case of standard by-products.

The Federal Food and Drugs Act of 1906 specifically includes in its scope the food of animals. It thus constitutes an additional safeguard against the adulteration or sophistication of feeding-stuffs entering into interstate commerce.

CHARLES FORD LANGWORTHY,

Department of Agriculture, Washington, D. C.

NUTRITION OF MAN. The term nutrition includes the sum of the processes by which an animal or plant absorbs and utilizes food substance. To be properly nourished, man must be supplied at suitable intervals with the foods which will best serve to build the body, maintain it in health and permit of the performance of the necessary amount of work. Food may, therefore, be defined as the nutritive material taken into the body for the purpose of growth and repair and for the maintenance of the vital processes. The body may be likened to an intricate engine which has to be built, kept in repair, supplied with fuel and operated. Food serves all these functions in the working machine, and in the intelligent selection of human food no function must be neglected.

Composition of Food.—A study of foods shows that they are made up of a few chemical constituents, namely, protein, fat, carbohydrate and ash, together with more or less water and in some cases with minute amounts of the newly-recognized vitamins. The first three of these constituents are organic compounds of carbon, hydrogen and oxygen, the proteins having in addition nitrogen, sulphur and occasionally other elements, such as phosphorus and iron. As regards the group *protein* the molecule is very complex and may vary within wide limits while still possessing certain common characteristics. It may be likened to a chain, longer or shorter, made of links which differ in number, kind or arrangement. There are 18 different kinds of links (amino acids) in most of the food proteins, but there are certain proteins which lack one, two or three kinds of links and are thus incomplete unless combined with others furnishing the lacking links. For convenience we may roughly divide the common proteins into two groups according to their make-up of amino acids. First, the complete proteins containing all essential amino acids, such as milk, eggs and meat, and certain vegetables, such as soy beans and peanuts; second, incomplete proteins including most of the vegetable proteins.

The group *fat* includes the fat of meat, such

as suet and lard, the fat of milk (butter), and true vegetable fats and oils like olive, corn and cotton-seed oil. Associated with these are the fat-like substances or lipoids, such as the phospholipins and phosphatids of egg yolk and of active animal and vegetable tissues. As the fats and fat-like substances differ from the other constituents of food in being soluble in ether, the term "ether extract" is often and quite properly applied to this group.

The group *carbohydrate* includes the sugars, starches, pentosans, celluloses, crude fibre, and other bodies of a similar chemical structure, all of which can more or less readily be broken down into the simple sugars. The group is usually divided according to the analytical methods followed in estimating it into nitrogen free extract" and "crude fibre," the former division including principally sugars, starches and most of the pentosans, and the latter cellulose, lignin and other woody substances which very largely make up the rigid structure of plants. The human body has the power of utilizing principally the sugars and starches as food, but the cellulose and other practically non-digestible carbohydrates may, however, serve a useful purpose in giving bulk to the food residues and thus facilitate their passage along the digestive tract. The carbohydrates occur chiefly in vegetable foods, although some are found in animal foods, such as the lactose, or milk sugar, in milk and glycogen in liver.

The group *mineral matter* includes the inorganic elements present in the form of salts or in combination with organic material in the juices and tissues of the different foods, the principal elements found being sodium, calcium, magnesium, iron, chlorine, fluorine, phosphorus and sulphur. The term "ash constituents" is often and very appropriately used for this group, since the mineral matter represents the incombustible portion which remains when any given food is burned. The ash constituents are present to some extent in all foods, with the exception of a few such as refined sugar, purified oils and pure starches. The proportion is much greater in milk, vegetables and fruits than in other foodstuffs.

The group of *vitamins*, or accessory factors, is composed, according to present knowledge, of two as yet unidentified substances, one soluble in fat and commonly known as fat-soluble A and the other soluble in water and known as water-soluble B. The water-soluble substance is present in nearly all common foods. It is not found, however, at least appreciably, in polished rice, commercial starch, pure sugar or in fat of either animal or vegetable origin. The fat-soluble substance is less widely distributed. It is found in the fats of milk, eggs and organs and in the green leaves of plants but is not found in seeds—save in or related to the germ—or in oils, such as olive oil and those from oil-bearing seeds, such as cotton seed. The occurrence of a third vitamin is claimed and the name water soluble suggested.

Water is present in practically all foods, predominating in fresh fruits and succulent vegetables.

Food as it is bought or even as served on the table contains more or less material which is not or cannot be eaten, such as the bones of meat and fish, the shells of eggs and the skins

and seeds of vegetables and fruits. In discussing the chemical composition of foods, such portions are usually spoken of as refuse, but they form an important item when the actual cost of the nutrients of food is considered.

Composition of the Body.—The human body is composed of the same general constituents as are the foods. Proteins are the most important constituents of body tissues, including the muscles and internal organs. Analyses of body tissues show that they are made up of the same links or amino acids as are the food proteins, but generally in a different form of linkage, so that it is necessary that the chains which are supplied by the food should be more or less completely unlinked and recombined in new form. The fat in the human body is found in adipose tissue, around certain organs, and joined with protein in complex combinations of still unknown composition in cellular protoplasm. Carbohydrates are present as glycogen in the liver and muscles and circulating as sugar through the blood. Mineral matter is found in the skeletal structure and active protoplasm and in the body fluids. The vitamins are present in the secretions of the mammary glands and the fat-soluble form in the fat of the active organs. Water is present in the body tissues and fluids.

Digestion and Absorption of Foods.—The similarity in composition of foods and of the human body shows that one important function of food is to furnish the necessary materials for the building and repair of the body. The food materials are made ready for this purpose by the process of digestion which consists in separating the useful portion of food from that useless to the body; breaking down complex substances into simpler forms, in dissolving and emulsifying and so making food capable of diffusion through the lining of the digestive tract. This is accomplished with the aid of digestive ferments or enzymes which are contained in the saliva, in the gastric juice of the stomach, and in the pancreatic juice of the intestines. The saliva has the power of changing starches into sugar. The gastric juice acts upon proteins and to a slight extent upon fats, and the pancreatic juice upon the proteins, fats and carbohydrates. The chemical change involved is in all cases hydrolysis, that is, the addition of the elements of water in such a way that simpler products are formed. Digestion is aided by the fine division of the food in chewing and by muscular contractions—the so-called peristaltic action of the stomach and intestine—which helps to mix the digestive juices and their enzymes with the food. The digested food passes through the walls of the alimentary canal into the blood. The heart pumps the blood containing the nutrients of the digested food and the oxygen which it gets in the lungs all over the body, and thus the organs and tissues are supplied with the materials which they need for their particular functions.

The protein materials have been broken down during digestion into the separate links or (amino acids), or simple combination of links of which they were composed, and the tissues now select the necessary links and rearrange them into new chains. The growth

of protein tissues, muscles, liver, kidney, blood, etc., is obviously dependent upon the supply of the proper amount of the required kinds of links, otherwise the needed protein chains cannot be formed. The processes of daily life cause the breaking down of a certain amount of the living tissue of the protein-rich type, and if the body is to be maintained this must be replaced or repaired from the protein which the food supplies. This renewal and repair process in the body tissue may be likened to replacing worn or broken links. The proper selection of food proteins thus involves the use of complete proteins or such a combination of incomplete proteins that the deficiencies of one are supplied by others.

The hydrolysis products of the fats are, upon absorption, recombined into neutral fat and pass from the blood into the tissues where a part is transformed into tissue lipid or enters into combination with proteins to form some of the chemically complex substances of cellular protoplasm, cell membrane, or the central nervous system. The greater part of the fat is either used as fuel or stored for later use.

The simple sugars, which are the digestion products of carbohydrate, pass from the portal vein into the liver where they are temporarily stored as glycogen. This is given up gradually to the blood in the form of the simple sugar glucose, the content of which in the blood remains small and nearly constant. The glucose, which is thus carried to the muscles and other tissues by the blood, is partly converted into fat but to a large extent used as fuel.

The mineral matter is used as bone constituents, giving rigidity and relative permanence to the skeletal tissues, as essential elements of the organic compounds which are the chief solid constituents of the soft tissues, and as soluble salts held in solution in the fluids of the body, furnishing the material for maintaining the elasticity and irritability of muscle and nerve, the acidity or alkalinity of digestive tissues and of secretions and the neutrality or slight alkalinity of the internal fluids.

The water present in the food is not a nutrient in the sense that it serves for building tissue or yielding energy, but it is essential, serving for carrying the food in the digestive processes, for diluting the blood and for many other physiological purposes.

The changes which the vitamins undergo and their exact function are not clearly understood, as their chemical nature is as yet unknown. A deficiency of fat-soluble A causes the failure of young animals to grow under otherwise suitable conditions, and its prolonged absence from the diet may lead to a peculiar eye disease, xerophthalmia. A deficiency of water-soluble B is the cause of the disease beri-beri, marked by a degeneration of the nervous tissues. A deficiency of a third vitamin, it is claimed leads to scurvy.

Fuel Value of Food.—The activities on which the life of the body depends involve a continuous expenditure of energy, and this energy is obtained by the oxidation of carbohydrate, fat and the non-nitrogenous fraction of protein, as in the form of digestion products they circulate in the blood, meeting the oxygen taken in through the lungs. They repre-

sent the fuel of the human engine, and their calorific, or heat-producing, power, may be measured as accurately as that of coal or any other fuel by the use of an instrument known as the bomb calorimeter which measures the heat produced in the burning of a given amount of material by means of the rise in temperature of a known volume of water surrounding the bomb in which the combustion takes place. The result is expressed in calories, the amount of heat necessary to raise one kilogram of water one degree Centigrade. One gram of carbohydrate or protein has been found to produce four calories of heat, while the same amount of fat furnishes nine. If then the percentage of each of these constituents in a given food is known, its fuel value can be easily calculated. The average composition of a number of common foods and the energy which one pound will furnish when burned in the body are shown in Table I.

In the selection of a fuel there are other things to be considered than the ultimate heat which can be produced. The carbohydrates, particularly the sugars, may be likened to a quick-burning fuel, while the fats act as a more concentrated fuel, burning more slowly. Only the non-nitrogenous portion of protein is available for fuel, and this, together with the fact that a certain amount of protein is indispensable as building material, makes the use of it as a fuel expensive and extravagant. In the body all three are used in varying amounts, a shortage of one kind being made up within limits at least at the expense of others, and if there is a general shortage the body has to call upon its own tissues for fuel. Carbohydrate is burned in largest quantities, but for the sustained effort a certain amount of fat has been found necessary.

Digestibility of Foods.—The digestion of food, the exercise of the functions of the various organs and the oxidation processes result in the formation of various excretory products. The parts of the food which escape digestion are periodically given off by the intestines. Such solid excreta or feces include not only the particles of undigested food but also the so-called metabolic products, that is, residues of the digestive juices, bits of the lining of the alimentary canal, etc. Other excretory products are the urine, respired air and perspiration. One of the most important considerations in fixing upon the value of any given food is its digestibility; in other words, the proportion of its nutritive ingredients which the body can retain and utilize. As frequently employed, the term digestibility has several other significations. Thus to many it conveys the idea that a particular food "agrees" with the user; in other words, that it does not cause distress when eaten. The term is also quite commonly understood to mean the ease or rapidity of digestion, and one food is called more digestible than another because it is digested more readily or in less time. However, the term digestibility, as most commonly used in scientific treatises, refers to the thoroughness of digestion. This can be calculated for the three organic constituents and ash by the analysis of the food consumed and of the resulting feces. The relation between the constituents of the food consumed and the corresponding con-

TABLE I.—AVERAGE COMPOSITION OF SOME COMMON AMERICAN FOOD PRODUCTS.

FOOD MATERIALS (AS PURCHASED)	Refuse	Water	Protein	Fat	Carbo- hydrates	Ash	Fuel value per pound
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Calories

stituents of the feces is known as the coefficient of digestibility. From a large number of experiments, it has been calculated that on an average the different groups into which foods may for convenience be divided have the following coefficients of digestibility:

comparatively thick walls on which the digestive juices have little effect. The heat of cooking, especially with the aid of water, ruptures these cell walls and also makes the starch more soluble. In the case of breads, cakes, pastry and other foods prepared from flour, the aim

TABLE II.—COEFFICIENTS OF DIGESTIBILITY OF NUTRIENTS AND THEIR FUEL VALUE PER POUND IN DIFFERENT GROUPS OF FOOD MATERIALS.

FOOD MATERIAL	Protein		Fat		Carbohydrates

As a general rule, it may be said that carbohydrate is more completely digested than proteins or fats, and that the protein of animal foods, as supplied by meat, milk, fish and eggs, is more digestible than that supplied by vegetable foods. It will be seen, however, that the coefficients differ less for the different types of food than might be expected from popular impressions of digestibility and indigestibility. The coefficients of digestibility are also less influenced by the conditions under which the food is eaten and vary less with individuals than is generally supposed.

Preparation of Food.—The preparation of food has much to do with its nutritive value. Thus, many articles which are unfit for nourishment when raw are nutritious and palatable when cooked. It is also a matter of common experience that well-cooked food is appetizing and wholesome, while the same material, if badly cooked, is unpalatable. Cooking is of importance for at least three reasons. It changes the mechanical condition so that the food material may be acted upon more freely by the digestive juices; it makes it more appetizing by improving the appearance or flavor or both; and it kills by heat disease germs and parasites if such be present. Food which is attractive to the taste quickens the flow of saliva and other digestive juices and thus aids digestion. The cooking of meats develops the pleasing taste and odor of extractives and that due to the browned fat and tissues, and by softening and loosening the protein of the connective tissues makes the meat more tender. Extreme heat, however, tends to coagulate and harden the albuminoids of the lean portions and also to weaken the flavor of the extractives. Heating often changes the structure of food materials very materially so that they may be more easily chewed and more easily and thoroughly digested. In many vegetables the valuable carbohydrates, chiefly microscopic starch grains, are contained in tiny cells with

is to make a palatable, light and porous food more easily broken up in the alimentary canal than the raw materials. Sometimes this is accomplished simply with the aid of water and heat. In cooking, the heat changes part of the water in the dough into steam, which in trying to escape forces the particles of dough apart. The protein (gluten) of the flour stiffens about the tiny bubbles thus formed in the dough, and the mass remains porous even after the steam has escaped. More often yeast or baking-powder is used to "raise" the dough. The baking-powder when wet gives off the gas, carbon dioxide, and the yeast causes fermentation in the dough by which the same gas is produced. This gas acts as the steam does, only much more powerfully. When beaten eggs are used to lighten dough, the albumin encloses air in bubbles which expand, and the walls stiffen with heat and thus render the food porous.

Quite generally foods lose weight in cooking. The principal loss is water, but if food, such as vegetables or meat, is boiled in water considerable nutritive matter, principally soluble salts and water-soluble vitamin is lost unless the water in which the food is cooked be utilized. Cooking in alkaline medium destroys water-soluble vitamins. The process of desiccation which is now so extensively employed in the preservation of fruits and vegetables renders the watery foods much more concentrated.

Food Requirements and Dietary Standards.—The information gained from a study of the composition and nutritive value of foods may be turned to practical account by using it in planning diets for different individuals or classes of individuals. There are four important methods of studying the food requirements under different conditions and obtaining the so-called dietary standards: (1) By observing the amount of oxygen consumed and carbon dioxide evolved (respiration experiments), (2) by de-

termining the balance of intake and output (carbon and nitrogen metabolism experiments), (3) by direct measurement of heat given off by the body (calorimeter experiments) and (4) by observing the amount of food consumed (dietary studies). The most direct and convincing way of ascertaining the energy metabolism is the third of these methods, known as the method of direct calorimetry. This consists in measuring the total energy expenditure of the body as heat, or as heat and mechanical work, by confining the subject in a chamber permitting of actual measurement of the heat produced. The results obtained by all methods

From results of many investigations by the methods described above, a number of so-called dietary standards have been suggested which are designed to show the amount of nutrients and energy which are required by persons of different occupations and habits of life. These standards represent reasonable amounts rather than maximum or minimum quantities and are to be thought as guides for home and institution management, rather than exact expressions of food requirement. The European dietary standards proposed by Voit and the American standards proposed by Atwater follow:

TABLE III.—DIETARY STANDARDS.

INDIVIDUAL AND OCCUPATION	Actually eaten			Digestible			Fuel value
	Protein	Fat	Carbo-hydrates	Protein	Fat	Carbo-hydrates	
	Gms.	Gms.	Gms.	Gms.	Gms.	Gms.	Calories

(*) Fat and carbohydrate in sufficient amounts to furnish, together with the protein, the indicated amount of energy.

are strikingly consistent, and by means of them it has been possible to tabulate hourly factors from which the day's energy metabolism and, therefore, the day's food requirement in terms of energy may be computed.

By means of the first and third methods, not only can the energy be calculated, but the proportion of fat and carbohydrate oxidized can be determined. The so-called balance or metabolism experiments are used to determine as nearly as possible the protein requirement and have also been applied to the determination of the calcium, phosphorus and iron requirements on the assumption that with an adequate supply of these essentials a balance will be maintained between the intake and output. The plan followed in the fourth method, or dietary studies, is as follows: Exact account is taken of all the food materials (1) on hand at the beginning of the study, (2) purchased during its progress and (3) remaining at the end. The difference between the third and the sum of the first and second figures is taken as representing the amounts used. The amounts of nutriment and energy furnished by the total quantity of each food material are calculated through the aid of figures obtained from analysis of samples of the different foods or from tables of average composition. From the total food eaten by all the persons during the entire period, the amount eaten per man per day can be calculated, using the so-called man value coefficients for the various members of the family. The following coefficients were adopted by the Interallied Food Commission in 1918: From 0 to 5 years, 0.5 man value; from 6 to 10 years, 0.7; 11 years and over, males 1, females 0.83.

With the recognition of differences in the quality of proteins and of the importance of the unidentified fat-soluble and water-soluble vitamins, for which we have as yet no direct quantitative measurements, a fifth method of studying the food requirements has come into extensive use, namely, biological studies of maintenance and growth under different dietary conditions. These are of necessity conducted on laboratory animals, and the interpretation of results in the light of human nutrition is more or less theoretical. They serve to indicate, however, that too much weight must not be attached to any attempt to state the requisites of an adequate diet in terms of exact quantities of certain nutrients. At best such standards should serve only as an indication and not as a rule.

Selection of Food.—We may summarize the material requisites of an adequate diet under the following heads: It must (1) provide sufficient amounts of digestible organic nutrients to yield the necessary number of calories or energy; (2) furnish proteins in ample amount and of suitable sorts; (3) supply adequate amounts and proper proportions of ash constituents; (4) furnish sufficient vitamins, and (5) it must include a sufficient amount of material of such physical character as to ensure the proper handling of the food mass in the digestive tract.

As a simple means of ensuring these requisites, the diet should be so arranged that it contains in reasonable amounts representatives of each of the following groups into which foods may for convenience be divided: (1) Green and succulent vegetables; (2) milk, eggs, meats and other typically protein foods; (3)

cereal grains and their products; (4) sugars, including those naturally occurring in sweet fruits, fresh and dried; and (5) fats, including milk fats and organ fats. The first group supplies mineral building material in a proportion large in comparison with its energy value. The second group supplies in its protein, in a proportion large as compared to its energy value, nitrogen in the right form for body-building material. The fourth group supplies little except body fuel in a quickly available form. The fifth group is like the fourth, an energy-yielding group, but is set apart because the amount of energy supplied per unit weight of fat is so much greater than that supplied by a unit weight in any other group. The third or middle group shares the properties of the groups which precede and those which follow, being valuable sources of mineral and nitrogenous body-building materials and also important sources of energy. If representatives of each group be used, the diet will not lack in vitamins, for the fat-soluble A is found in the leafy vegetables of group 1, in milk, eggs especially in meat of group 2 and in butter and organ fat of group 5, and water-soluble B in representatives of at least the first three groups.

These groups should also be kept in mind in the economic use of food. A considerable choice of selection on the basis of cost can be made among foods of each group. If the group system or some equivalent is not adhered to there is danger in the economic selection of food of limiting too much the choice of foods to those of high calorific value, such as the cereal products. There is economic justification for the purchase of certain foods, particularly vegetables and fruits, which would appear expensive if considered simply as sources of energy. When economy demands the diminished use of meat, other protein foods should replace it in proper proportion. The greatest factor of safety in the human diet is the regular use of milk because of the high quality of its proteins, its mineral content and its richness in fat-soluble A.

In order that one may partake of a truly varied diet in which the various groups are rationally represented, proper dietary habits are very important as are also wise food selection and good cookery. Good food habits should be taught in youth. If they have not been acquired then, a special effort should be made to acquire them in later life.

CHARLES FORD LANGWORTHY,
Department of Agriculture, Washington, D. C.

NUTS, hard-shelled fruits, indehiscent, with a hard, dry pericarp, growing on certain trees and bushes in most temperate and tropical regions. The shell, which is often enclosed by woody or leathery husks, does not open of itself when the nut is ripe. Common examples are hazel and hickory nuts. Peanuts and other ground nuts properly belong to another class of fruits. The more important nuts may be divided into two classes: (1) those used for food, and (2) those used for oil, dyeing and other purposes, medicinal, ornamental and commercial.

The principal kinds of edible nuts are sweet and bitter almonds (*Amygdalus communis*), native to Asia Minor, northern Africa, southern Europe, and successfully cultivated in Cali-

fornia; Brazil-nuts, or nigger-toes, the seeds of a majestic tree (*Bertholletia excelsa*), whose habitat is Venezuela and northern Brazil; bread-nuts growing on a tree (*Brosimum alicastrum*) of Jamaica; several varieties of chestnuts, the American (*Castanea americana*) in the Eastern and Southern States, the Spanish (*Castanea sativa*) in southern Europe, northern Africa, and western Asia, also species found in Australia and Tahiti; cocoanuts, the fruits of the cocoanut palm (*Cocos nucifera*) in the East Indies, West Indies, Florida, South America, and Oceania; cola, or kola nuts, the seeds of a tree (*Cola acuminata*) native to West Africa and cultivated in tropical America; hazelnuts, filberts, or cobnuts (*Corylus avellana*) in England, Spain, Sicily, and other parts of Europe, also the American hazel (*C. americana*) and the California hazel; hickory nuts (*Carya alba* and other species) in the United States (from Maine to Texas) and Mexico; pecans (*Carya olivæformis*), in Indian Territory, Texas, Louisiana, and other southern States; pistachios or green almonds (*Pistacia vera*), found in southern Europe, southwestern Asia, and northern Africa; souari or suwarrow nuts (*Caryocar nuciferum*), also called the butternut of Demerara, native to Brazil and Guiana; walnuts (*Juglans regia*), commonly named English or Persian walnuts and Madeira-nuts, in Asia, Europe, Chile and California, also the black walnut (*J. nigra*) and the white walnut (*J. cinerea*) or butternut of the United States.

Certain edible nuts are used as sources of oil. The principal kinds are the almond (sweet and bitter), the ben nut of the East Indies, the candle nut of the South Sea Islands, the cashew-nut of the West Indies, the cocoanut of the East Indies, the dika nut of West Africa, the palm nut of West Africa, the pine nuts of Europe and Asia, the physic nut (*Curcas purgans*) of tropical America, the English walnut and the American butternut.

Of nuts having medicinal qualities are the seeds of *Strychnos nux-vomica*, of southern Asia and the East Indies, from which the poisonous drug nux-vomica is obtained, and the betel nuts, fruit of the areca palm (*Areca catechu*), in the East Indies and the Philippines, used as a vermifuge, also said to have stimulant and tonic properties. Some kinds of nuts are turned to account for various practical and ornamental purposes. The boomah nut (*Pycnocoma macrophylla*), of Africa, is used for tanning; soap-nuts (*Sapindus saponaria*), of the West Indies, in washing. The horse chestnut (*Æsculus hippocastanum*), of Europe, contains starch. The cumara nut (*Dipterix odorata*), of Brazil, is valuable for its perfume. The sassafras nut (*Nectandra puchury*), of Brazil, is used in flavoring chocolate. Ravensara nuts, also called the Madagascar clove nutmeg, are useful for seasoning. Many species of nuts are prized as ornaments. Betel nuts are utilized as coat buttons; bladder nuts (*Staphylea pinnata*), of Central Europe, are worn as beads in necklaces; also the bonduc nut (*Guilandina bonduc*), of India, and the grugru nut (*Acrocomia schlerocarpa*), of South America, are used as beads. The corozo nut or vegetable ivory, of Brazil and Colombia, is made into toys, and the coquilla nut (*Attalea funifera*), of Brazil, is valuable for decorative turnery.

The demand for nuts as an article of commerce is constantly growing. The consumption of home-grown nuts cannot be accurately estimated. The yearly exports of domestic nuts amount to \$398,312, of which pecans (the most important of native nuts) form a considerable item. Imports during the fiscal year 1914 amounted to nearly \$19,782,924, the bulk being of three kinds: almonds (\$4,678,000), walnuts (\$4,492,000), and cocoanuts (\$3,292,000). The most popular varieties of almonds are from Tarragona and Ivica, Spain, and from Formigetta, France. Shelled almonds, which are largely used by confectioners, for the most part come from Spain, Sicily and Italy. The walnuts from Grenoble, France, are said to be the best, and those from Naples have a fine flavor. Importations of cocoanuts are chiefly from South America and the West Indies. Of other nuts, filberts or hazels come principally from Italy, Sicily and Spain, chestnuts from France and Italy, and Brazils from South America.

Recent experiments tend to show that the food value of nuts is much greater than was formerly supposed. Many savages and wild animals depend largely upon nuts for sustenance through long periods of the year. According to a missionary of the Kongo, the natives subsisted almost entirely upon cola nuts during a famine lasting months. Among civilized people nuts have been looked upon as accompaniments to a feast, promoting cheerfulness and pleasant talk. They serve this purpose and more, for as sources of protein and fat they furnish considerable nutritive material and energy. Where other provisions are deficient in protein or albuminoids and fat, almonds and walnuts supply this lack. The chestnut may be used as a substitute for the cereals, because of its high proportion of starch, sugar and dextrin. In some parts of Asia nut oil is used considerably in cooking.

Almonds, Brazil-nuts filberts, hickory nuts, pecans, walnuts, chestnuts and other nuts contain in concentrated form a great deal of nourishment. When bought at ordinary prices, they should not be considered luxuries but fairly economical articles of diet. Investigations carried on at the Agricultural Experiment Station of the University of California in 1901-02 emphasize the fact that nuts are to be regarded as true foods rather than food accessories.

Samples are selected from various analyses of nuts. The edible portion of almonds contains: water, 4.8 per cent; protein, 21; fat, 54.9; carbohydrates, 7; ash, 3.9; fuel value per pound, 3,030 calories. Almonds are generally eaten as dessert, as is the Brazil-nut, whose edible portion contains: water 5.3; protein, 17; fats, 66.8; carbohydrates, 7; ash, 3.9; fuel value per pound, 3,329. The chestnut (Spanish, dry) contains: water, 5.9; protein, 10.7; fat, 7.0; carbohydrates, 74.2; ash, 2.2. The chestnut is widely grown in France, where large quantities are used as food by both poor and well-to-do classes. Dried chestnuts are ground to flour and baked in cakes. In Italy the chestnut is eaten fresh, boiled and roasted, also in the form of porridge. Chestnut cake is a common delicacy among the peasants of the Apennines. In Korea the chestnut practically serves as a substitute for the potato, being cooked in several ways. In some countries chestnuts are used for fattening hogs

and other animals. The edible portion of the filbert contains: water, 3.7; protein, 15.6; fat, 65.3; carbohydrates, 13; ash, 2.4; fuel value per pound, 3,432. The filbert is eaten chiefly as a dessert in England and America. In some countries of Europe it is often roasted, and it is sometimes ground to a flour and made into bread. It is grown in enormous quantities about Trebizond. The fruit of the shag-bark hickory is a great favorite with Americans. The edible portion of the hickory nut contains: water, 3.7; protein, 15.4; fat, 67.4; carbohydrates, 11.4; ash, 2.1; fuel value, 3,495. The pecan (*Hicoria pecan*) is the most popular of American nuts. The edible portion of the pecan contains: water, 3; protein, 11; fat, 71.2; carbohydrates, 13.3; ash, 1.5; fuel value per pound, 3,633. The English walnut ranks next to almonds in popularity. In Korea it is a regular article of diet. The edible portion of the walnut (Italian, *J regia*) contains water, 2.5; protein, 27.6; fat, 56.3; carbohydrates, 11.7; ash, 1.9; fuel value per pound, 3,100. As there is practically no refuse in the composition of nuts, other food substances having bulk should be eaten with them. Vegetarians point to the lithe, active squirrel and recommend the eating of nuts for reducing the abdomen and increasing agility. The fact that Americans do not appreciate the food value of nuts as much as Europeans and Asiatics do is attributed to the abundance of fruits and cereals in this country. The increasing demand, however, is encouraging nut culture in California and other States. The quantity and value of nut products in the United States as reported by the 13th census was as follows:

Almond.....	6,793,539 lbs.
Pecan.....	9,890,769 lbs.
Persian English walnut.....	22,026,524 lbs.
Miscellaneous nuts.....	23,617,178 lbs.
Value of all nuts.....	\$4,447,674

H., 'Nuts as Food,' 15th Annual Report Maine Agricultural Experiment Station (1900); Jaffa, M. E., 'Nuts and Their Uses as Food'; United States Department of Agriculture, *Farmers Bulletin*, No. 332 (1910); 'Reports Twelfth Census,' Vol. VI (1900); 'Nut Culture in the United States,' United States Department of Agriculture, Division of Pomology (1896); Fuller, 'The Nut Cultivist' (1896); Hume, 'The Pecan and its Culture' (Glen Saint Mary, Fla., 1910); Lake, 'The Persian Walnut Industry of the United States' (*Bulletin* No. 254 of the United States Bureau of Plant Industry); Parry, 'Nuts for Profit' (Parryville, N. J., 1897).

NUTT, nüt, Alfred Trubner, English folklore and Celtic scholar: b. London, 22 Nov. 1856; d. 1910. His education was obtained at University College School and the Collège de Vitry François. After serving from 1874 a three-years' apprenticeship in the book publishing business on the Continent, in Leipzig, Berlin and Paris, he succeeded to that of his father, David Nutt, in London, in 1877. He joined the Folk Lore Society soon after and was elected its president in 1897. He founded the English Goethe Society in 1886 and was one of the founders of the Irish Texts Societies in 1898.

He has written 'The Legend of the Holy Grail with Especial Reference to the Hypothesis of its Celtic Origin' (1888); 'The Voyage of Bran' (1895-97); 'Celtic and Mediæval Romances' (1899). He founded the '*Folk-Lore Journal*,' the title of which was afterward shortened to '*Folk-Lore*'; and contributed extensively to it and other magazines.

NUTTALL, nŭt'al, **George Henry Falkner**, American biologist: b. San Francisco, Cal., 5 July 1862. He is the son of Dr. Robert Kennedy Nuttall and the brother of Zelia Nuttall, the Mexican archæologist. He was graduated in medicine at the University of California in 1884 and took a Ph.D. at Göttingen in 1890. In 1890-91 he was assistant and associate at Johns Hopkins University, Baltimore; in 1894-99 he was a member of the staff of the Hygienic Institute, Berlin, and university lecturer in bacteriology and preventive medicine; and in 1900-06 he was lecturer in bacteriology and reader in hygiene in the University of Cambridge, England, where since 1906 he has been Quick professor of biology. He has been examiner for diplomas in public health and tropical medicine and hygiene at Cambridge, at the University of Liverpool and for the Royal Army Medical Corps; director of the Quick Laboratory, University of Cambridge, a member of Advisory Committee for Plague Investigations in India and of the Imperial Bureau of Entomology (Colonial Office, London). In 1892 Dr. Nuttall found the *Bacillus aerogenes*. In 1905 he demonstrated that bacteria in the alimentary canal are unnecessary for a perfect digestion in healthy animal life. In 1899 he showed the important part played by insects, the spider family and centipede family as transmitters of bacterial and parasitic diseases. Dr. Nuttall is an authority on tropical diseases and tropical medicines and is a member of various medical societies that specialize on these subjects. He is an officer and member of numerous medical and scientific societies. He was founder and editor of the *Journal of Hygiene* (1901) and of *Parasitology* (1908). He has published over 150 articles on American, British, German and other journals since 1886, dealing with research work in bacteriology, entomology, protozoology, hygiene and physiology and also 'Hygienic Measures in Relation to Infectious Diseases' (1903); 'Blood Immunity and Blood Relationship' (1904); 'The Bacteriology of Diphtheria,' with Graham Smith and others (1908); 'Ticks,' with C. Warburton and others (1908); 'The Drug Treatment of Canine Piroplasmiasis' (1910); 'Russian Ixodoides' (1912); and 'The Training and Status of Public Health Officers in the United Kingdom' (1913).

NUTTALL, nŭt'al, **Thomas**, English-American naturalist: b. Long, Preston, Settle, Yorkshire, England, 5 Jan. 1786; d. Nutgrove, near Saint Helens, Lancashire, England, 10 Sept. 1859. He learned printing, came to the United States in 1807; traveled widely; made numerous discoveries in botany; ascended the Missouri River in 1811, the Arkansas in 1819, and in 1825-34 was professor of natural history and curator of the botanic gardens at Harvard. In 1834 he joined an exploring party headed by Captain Wyeth to the Oregon and Upper California. From there he went to the Sandwich Islands, returning home by way of Cape Horn.

From 1842 he resided in England. Among his publications were 'The Genera of North American Plants' (1818); 'A Journal of Travels into the Arkansas Territory' (1821); 'Introduction to Systematic and Physiological Botany' (1827); 'A manual of the Ornithology of the United States and Canada' (1834); 'Narrative of the Pacific Expedition' (1839); and 'The North American Sylva: Trees not Described by F. A. Michaux' (1842-49).

NUTTALL, Zelia, American archæologist: b. in San Francisco, Cal., in 1864; d. in Mexico in 1915. She was the daughter of Dr. Robert Kennedy Nuttall and the sister of Dr. George Henry Falkner Nuttall the biologist. She was educated in Paris, Germany, Italy and at Bedford College, London. She made a special study of languages and turned her attention to the antiquities of Mexico. Her researches in Mexican archæology, ancient picture-writing and history made her famous and she took her place among the leading authorities on these questions. She first attracted attention by a contribution to the *American Journal of Archaeology* (1886) on 'The Terra Cotta Heads of Teotihuacan.' The following year she became assistant of the Peabody Museum and in 1908 was made honorary professor of the National Museum in Mexico. When the discoveries of mysterious old ruins in Mexico made that country a second Greece for archæologists Mrs. Whitelaw Reid and Mrs. Crocker of San Francisco gave the University of California funds to pursue archæological researches there. Zelia Nuttall was appointed field director of the Reid-Crocker mission. She then established herself in Coyoacan, one of the historic suburbs of Mexico City, in an ancient palace built by Alvarado, one of Cortez's aides. In her explorations of the Pyramids of the Sun and Moon near Teotihuacan, 27 miles from Mexico City plans for a local museum were made. She was a member of the scientific mission sent to Russia in 1894 by the University of Pennsylvania; a member of the jury of awards in all of the great American expositions beginning with the Columbian, and was the recipient of many medals from foreign countries. She was a member of American and foreign scientific societies. She prepared a facsimile edition of an ancient Mexican Codex (original owned by Lord Zouche at Harynworth, England) which is published as the 'Codex Nuttall' (1902), and published, in addition to numerous papers; 'The Fundamental Principles of Old and New World Civilization' (1901); 'Book of the Life of Ancient Mexicans' (1903); 'Penitential Rite of the Ancient Mexicans' (1904); 'New Light on Drake: Documents Relating to his voyage of Circumnavigation 1577-1580' (1914). Consult sketch (with portrait) by Danenbaum, R., 'Archæologist of Mexico' in *World To-day* (Chicago, April 1908).

NUTTING, Charles Cleveland, American zoologist: b. Jacobsonville, Ill., 25 May 1858. He was graduated from Blackburn University, Illinois, in 1880 and received the degree of M.A. in 1882. In that year he engaged in zoological explorations for the Smithsonian Institution, visiting Central America in 1882-84, and Florida in 1885. In 1886 he became curator and professor of zoology in the Museum of Natural History of the University of Iowa which he

held till 1890 and then became head of the department of zoology in the State University of Iowa. He was engaged in important scientific researches onward. He went to the Saskatchewan River in 1891, to the West Indies in 1893, Plymouth, England, and Naples in 1895, California in 1895 and 1909 and to the Barbadoes in 1917. He was a member of the civilian scientific staff of the United States ship *Albatross* during the Hawaiian cruise of 1902. Mr. Nutting is a member of various scientific societies and has been president of the American Society of Zoologists, central branch, since 1907. He collaborated in the reports of the Siboga Expedition (1909-11). His most important publications are 'Narrative of Bahama Expedition from University of Iowa' (1893); 'American Hydroids,' which appeared in the reports of the United States Commission of Fisheries and elsewhere (1900-04); report on 'Gorgoniacea of the Siboga Expedition' (1910). He is also the author of numerous articles published in scientific magazines in the United States and England.

NUTTING, Mary Olivia, American writer: b. Randolph Centre, Vt., 1 July 1831; d. 1910. She was graduated from Mount Holyoke Seminary (now College) in 1851, taught there 1853-70, was librarian of the institution 1870-1901, and from the last-named date to her death librarian emeritus. She wrote under the name of Mary Barrett until 1894. She has published 'Steps in the Upward Way' (1867); 'Our Summer at Hillside Farm' (1867); 'The Story of William the Silent' (1869); 'The Days of Prince Maurice' (1894), etc.

NUX VOMICA, the popular name for the seeds of a tree (*Strychnos nux-vomica*) of the natural order *Loganiaceæ*. The tree is a native of Ceylon, Coromandel and other parts of southern Asia. It is of medium size, bears oblong, entire smooth leaves, and flowers in terminal corymbs, followed by one-celled berries as large as oranges. They have brittle shells, white gelatinous pulp, and flat, disc-like hairy gray seeds which are tough, odorless and very bitter. The pulp is a favorite food of many birds. The seeds have long been used in pharmacy and medicine, and are of great value, being the source of the alkaloids strychnin and brucin. Under the name false Angostura bark the bark of this tree has been used to adulterate the true Angostura bark, from which it differs in its properties.

NYACK, nī'āk, N. Y., village in Rockland County, on the Hudson River, where the expansion is called Tappan Bay, and on a branch of the Erie Railroad. It is connected by ferry with Tarrytown on the opposite side of the Hudson, and it is about 26 miles from the Grand Central Station in New York. It was settled in 1700, incorporated as a village in 1873, gave up its charter in 1876, and was again incorporated in 1883. It is a beautiful residential village, but has some manufacturing. The chief industrial establishments are boot and shoe factories, wagon, carriage and sleigh factory, yacht, boat-building, and cloth finishing works. For many years it has been an educational centre; it is the seat of the Nyack Military Academy, the Hudson River Military Academy and the Rockland Military Academy. It has public and par'sh

schools, a public library and several good church buildings, notably Saint Ann's (Roman Catholic), the interior of which is beautifully decorated. The village owns and operates the waterworks. Pop. 4,444.

NYAM-NYAM, nyām-nyām', **NIAM-NIAM**, **AZANDE**, or **ZANDEH**, an African people of Negro-Hamite race, composed of numerous petty tribes dwelling in the basins of the Shari and Welle rivers. They number upward of 2,000,000. The men devote themselves to hunting and war; the women cultivate the fields and eleusine, manioc, sweet potato, gourds, yam, banana, etc. These with game are the chief food, though a portion of the people are notorious cannibals. They have no cattle. Considerable manual and artistic skill is shown in the forging of iron, making of pottery and baskets, and the carving of wood. They are passionately fond of music, and play a kind of mandolin. Polygamy prevails. Their weapons are spears, knives, a species of iron boomerang and shields. The petty tribes of which they are composed are partially independent and partly dependent to the Belgian Congo. Consult Schweinfurth, Georg, 'The Heart of Africa' (New York 1874); Stanford, 'Africa' (London 1895).

NYAN, nī-ān', a large wild sheep (*Ovis hodgsoni*) of the Tibetan Mountains, with great spiral horns on the head of the ram, and yielding excellent mutton. It is called argali by British sportsmen, and is one of the prizes of the chase in the Himalayan region.

NYANGWE, nyāng'wě, Africa, a trading station in the Kongo Free State, on the Kongo River; lat. 4° 15' S.; long. 26° 20' E. In 1871 it was visited by Livingston, and in 1876 Stanley made the place his headquarters while exploring the Upper Kongo. It is connected by road with Albertville on Lake Tanganyika. By caravan route, rivers and steam cars from Leopoldville connections exist with the Atlantic.

NYANZA, nyān'zā, a Bantu word meaning "great water." It is used as the English word "lake" in connection with the names of three large bodies of water in Central Africa: as, Albert Nyanza, Victoria Nyanza and Albert Edward Nyanza.

NYASA, nyās'sā or nyās'sā (from the Bantu word *nyanza*, that is, "great water"), a lake in southeastern Africa, nearly 400 miles from the Indian Ocean, and west of German East Africa, discovered by Livingston in 1858. It extends north and south about 350 miles, and east and west from 20 to 50 miles; area, about 14,300 square miles. It is about 700 feet deep at its southern point, but to north, or its source, it is quite shallow. Toward the south the bed sinks below the level of the Indian Ocean, and at its head the surface is over 1,000 feet above the ocean level. The outlet is Shiré River, which flows south into the Zambesi. With the exception of Murchison Falls and Rapids, 70 miles long, in the Shiré River, there exists unbroken water communication between the head of Nyasa and the Indian Ocean. The African Lake Company have launched steamers on the lake, investigated the coast, and made a road from the north end of the lake up the heights to the plateau between Nyasa and Tanganyika (q.v.). Another road has been made

around the rapids in the Shiré River. On the west and east coasts are mountains, those on the east are from 4,000 to 11,000 feet in height. In some places low sandy land extends between the water and the mountain, and in other parts, as at the north, the mountains come down to the water. A number of rivers flow into the lake from the west; they have broken through the mountain barrier.

NYASALAND PROTECTORATE, Africa, a portion of British Central Africa, lying around the shores of Lake Nyasa, and extending to the banks of the Zambezi, known from its constitution 14 May 1891 until the change to the present name in 1907, as the **BRITISH CENTRAL AFRICA PROTECTORATE**. It includes all British Nyasaland, as well as the Shiré Highlands, and the greater part of the basin of the river Shiré. The expenses of administering the Protectorate are partly met out of revenue locally raised, and further by an annual grant from the Imperial government. The administration is in the hands of a governor, assisted by an executive and legislative council. The area of the Protectorate is about 40,000 square miles; the European inhabitants number about 800, the Asiatics, 400, the native inhabitants about 1,060,000.

The principal occupation of the European settlers is planting; and many thriving plantations of coffee, sugar, cinchona and tobacco have been established. Ivory, tea, ground nuts and rubber are also raised. The principal imports are soft goods, provisions and hardware. The chief towns, Blantyre, Zomba, Fort Johnston (the principal port on Lake Nyasa, and naval depot), Karonga (north end of Lake Nyasa), the starting point for Tanganyika and Kotakota (west coast of Lake Nyasa). The Protectorate is divided into 12 districts, managed by a number of collectors and assistant collectors, judicial officers, etc. There is at least one judicial officer, and in some cases two or three, in each district. Almost the entire trade of British Central Africa is with the United Kingdom. Steamers ply on Lake Nyasa and on the Zambesi and Shiré rivers. A railway, 113 miles in length, now connects Port Herald with Blantyre, and is projected to Lake Nyasa. The Protectorate is connected by telegraph overland with the Cape; and, with the Portuguese rivers, to Chinde its port of outlet at the mouth of the Zambesi, and with Quilimane.

Consult Duff, H. L., 'Nyasaland under the Foreign Office' (London 1906); Johnston, Sir H. H., 'British Central Africa' (London 1897); Rankin, D. J., 'The Zambezi Basin and Nyasaland' (London 1893).

NYAYA, nyá'ya. See **HINDUISM**.

NYCTIPITHECUS. See **DOUROUCOULI**.

NYDIA, a character in Bulwer's 'Last Days of Pompeii.' She is a blind flower girl, of good birth, rescued from slavery by the hero.

NYE, nī, Edgar Wilson, American humorist: b. Shirley, Me., 25 Aug. 1850; d. near Asheville, N. C. 22 Feb. 1896. He removed when a young man to Wyoming Territory; studied law, and was admitted to the bar in 1876. He served as postmaster and was elected to the legislature. Subsequently he made his home in New York (1886), having already become widely known as a humorous lecturer and

writer under the pseudonym of 'Bill Nye.' His humor, which was very largely his own, consisted of daring puns and a hitherto unheard of free use of the English language. He treated, in a familiar way that caught the public fancy, kings and princes and men in high places. He was the author of 'Bill Nye and Boomerang' (1881); 'Forty Liars' (1883); 'Bill Nye's Blossom Rock' (1885); 'Remarks' (1886); 'Chestnuts' (1887); 'Fun, Wit and Humor' (1889); with J. W. Riley; 'Comic History of the United States' (1894); 'Comic History of England' (1896); 'Baled Hay,' etc.

NYEZHIN, nyě'zhēn. See **NIZHAN**.

NYIREGYHÁZA, nyě-rěd-y-hă'zō, Austria-Hungary, town in the district of Szabolcs, on the Nyir River, and at the junction of two railroads, about 170 miles by rail northeast of Budapest. It is in a productive agricultural region in which wheat, grapes and a variety of fruits grow luxuriantly. It is in the vicinity of the Tokay wine region. There are a number of manufacturing industries, among which are the manufacturing of matches, soda and saltpeter. Pop. about 40,000.

NYKÖPING, nü'hē-ping, Sweden, seaport, on a bay of the Baltic Sea, about 60 miles southwest of Stockholm. In the 13th century this was one of the most important places in Sweden. The castle, now a ruin, ranked in strength with those of Stockholm and Calmar. In 1719 the town was captured and nearly destroyed by the Russians. It has regular steamer communications with Stockholm and other ports, and is of considerable manufacturing and commercial importance, its business in spun goods and grain being very active. Pop. about 11,000.

NYLGHAU. See **NILGAI**.

NYM CRINKLE. See **WHEELER, ANDREW CARPENTER**.

NYMPH. See **PUPA**.

NYMPHÆACEÆ, an order of aquatic plants the water-lilies. They are generally large, floating on the surface of the water, and having a stem which forms a subterranean creeping shoot. The flowers are very large, solitary, with cylindrical peduncles as long as the petioles of the leaves; the perianth is colored, petaloid, composed of a great number of petals, arranged in several rows, and often inserted, as well as the stamens, in the lower part of the sides of the ovary; the outermost of these petals seem to constitute a calyx, while those within form a kind of corolla. The stamens are very numerous; the anthers are turned toward the centre of the flower. The ovary is simple, covered almost throughout by the perianth-segments and by the stamens; it is globular, with several cells, each containing a great number of ovules; the stigma is radiated, peltate, sessile. The fruit is globular, resembling externally a poppy capsule, indehiscent, fleshy within, divided into a great number of cells containing seeds immersed in a fleshy pulp. This order furnishes one of the best examples of the gradual passage of petals into stamens and of sepals into petals; the transition is so insensible that many intermediate bodies are neither precisely petals nor precisely stamens, but part of both. The principal genera of the order are *Euryale*, *Victoria*, *Nymphæa* and

Nuphar. See LOTUS; VICTORIA REGIA; WATER-LILY.

NYMPHS, in Greek mythology, youthful goddesses of inferior rank to the other divinities who dwelt in Olympus. Begotten by Oceanus, or by Zeus and others, they preserve and nourish the woods, rivers, springs and mountains. They are, therefore, distinguished according to their offices, as Oceanides, nymphs of the ocean, regarded as daughters of Oceanus; Nereides, or nymphs of the Mediterranean, who were regarded as daughter's of Nereus; Leimon-iades, or nymphs of the meadows; Dryades or Hamadryades, or nymphs of trees, whose lives were regarded as beginning and ending with those of the trees with which they were associated; Melides, or nymphs of fruit-trees; Oreades or Orestiades, or nymphs of mountains and grottoes: these, dressed lightly, as huntresses, were the companions of Artemis (Diana), who was herself originally an Arcadian nymph; there were also Naiades, who presided over fountains, Potamides over rivers, and Limniades over lakes. The nymphs hold a middle station between gods and mortals, and, without being immortal, yet live longer than is permitted to man. At their death the substance which they have supplied with nourishing moisture perishes also. This first notion of nourishment, which is supposed in the very idea of a nymph, seems to have given origin to the second representation of them as nurses of young children entrusted to their care.

NYORO, or **BA NYORO**, Bantu tribe living on the shores of Lake Albert Edward, in Africa. As a race they are well built, tall and good-looking. They live in cone-shaped, thatched huts and make dugout canoes, bur and rafts. They lived principally on sweet potatoes, fish and game, and are good weavers, potters and workers in iron. They are said to number about 125,000.

NYRÉN, nü-ran', **Magnus**, Swedish astronomer: b. Wernland, Sweden, 21 Feb. 1837. He was educated at Upsala and became an instructor in the Pulkova Observatory in 1868. His astronomical researches have been of great value and he was made vice-director of the Observatory at Pulkova in 1890, a position which he retained until 1908. In 1888 he was appointed Councilor of State; and in 1899 he was awarded the Valz prize by the Académie des Sciences, Paris. He has published 'Détermination du coefficient constant de la précession au moyen d'étoiles de faible éclat'; 'Bestimmung der Nutation der Erdachse' (1873); 'Variations de la latitude de Poulkova' (1893); 'L'Aberration des étoiles fixes' (1883), etc.

NYS, nüs, **Desiré**, Belgian philosopher: b. Saint Léger, Belgium, 21 Nov. 1859. He was educated at Tournai and at the universities of Louvain and Leipzig. In 1883 he was ordained a priest of the Catholic Church and from 1893

to 1906, served as director of the Séminaire Léon XIII at Louvain. He was made its president in 1906 and in the same year was appointed to the chairs of cosmology, psychology and chemistry in the University of Louvain. He is knight of the Order of Leopold II and member of the Philosophic Society of Louvain. He has published 'Le problème cosmologique' (1888); 'La notion detemps d'après S. Thomas d'Aquin' (1898); 'La notion d'pace au point de vue metaphysique et psychologique' (1900); 'La cosmologie' (1900; 2d ed., 1906); 'Les theories sur la nature de l'espace depuis Descartes' (1907). He is a contributor to 'The Catholic Encyclopedia' and to *La Revue Néo-Scholastique*.

NYS, **Ernest**, Belgian lawyer: b. in Contrai, Belgium, 27 March 1851. He was educated at the universities of Ghent, Heidelberg, Leipzig and Berlin and practised law in Antwerp and in Brussels, in both of which cities he held judicial posts. He became professor of international law in the University of Brussels and was made a member of the permanent court of arbitration at The Hague. He was also one of the editors of the *Revue de Droit International*. He is professor of international law at the Brussels University. The degree of honorary doctor of laws was given to him by the universities of Oxford, Edinburgh and Glasgow. His books include 'La guerre maritime' (1881); 'Le droit de la guerre et les précurseurs de Grotius' (1882); 'Les origines du droit international' (1894); 'Recherches sur l'histoire de l'économie politique' (1898); 'Le Droit international,' 3 vols. (1904-6, new ed., 1912); 'Idées modernes; 'Droit international et franc-maçonnerie' (1908); 'Les Etats-Unis et le Droit de gens' (1909); 'Le Droit romain, le droit des gens et le Collège, des docteurs en droit civil' (1912).

NYSSA, nīs-täg'müs, a genus of trees. See TUPELO.

NYSTAD, nü'stat, Finland, town in the Län of Abo-Björneberg, on the Gulf of Bothnia, 40 miles southeast of Abo. At Nystad was concluded in 1721 the treaty between Sweden and Russia, by which the territory conquered by Peter I along the Gulf of Finland and the Baltic was conceded to Russia. Pop. 4,500.

NYSTAGMUS, involuntary motion of the eyeballs. The movement is usually lateral, but is sometimes rotatory, and in rare cases vertical. It may be induced by inflammation and other disorders of the eyes, and in miners is not infrequently caused by long-continued work underground in obscure light. Very little in the way of cure is possible.

NYX, nīks, in Greek mythology, the goddess of night or darkness. She was the daughter of Chaos. Her brother was Erebus.

O

O the fifteenth letter and the fourth vowel of the English alphabet. It is derived, through the Latin and Western Greek alphabets, from the Phœnician letter ayin, of the same shape, corresponding to the Hebrew *ע* and pronounced as a heavy glottal catch. It is called the labial vowel because of the part the lips have in its pronunciation: for analogous reasons the third vowel *i* (ee) is called the palatal and *a* (ah) the guttural vowel. In the Greek alphabet, as we now have it, there are two characters to represent this vowel, namely, great *o* (omega, Ω, ω) and little *o* (omicron, Ο, ο), but these characters were not differentiated in early times. The vowel sounds in our language which are represented by *o* are numerous, namely, (1) The sound it has in *oh*, *lo*, *cone*: this is the regular, long sound of *o*, and it is common to English with most other languages. Curiously, English seems to lack the short vowel sound corresponding to this long *o*: what is usually called the short *o*, the vowel sound in *on*, *odd*, *log*, is not the *o* of *lone* shortened, but rather the sound of *a* in *all* shortened. But though orthoepists hold that the true short open vowel sound of *o* is unknown in English, natives of New England almost invariably in many words shorten the open *o* (as in *go*) without changing its quality; in their pronunciation of *bone*, *home*, *coat*, *toad*, etc., the vowel is the true *o* shortened. This short *o* is not recognized by Alexander J. Ellis as an English vowel sound. The editors of Webster's Dictionary (edition of 1879) remark of this local pronunciation that "its rise and growth are interesting facts, and its final prevalence is a thing he (the theoretic phonologist) would rather desire than deprecate." The long *o* sound is variously represented in English; by *o* (*lo*), by *ow* (*low*), by *au* (*hautboy*), by *eau* (*beau*), by *eo* (*yeoman*), by *ew* (*sew*), by *oa* (*roam*), by *oe* (*hoe*), by *oo* (*door*), by *ough* (*dough*), by *ou* (*shoulder*), and by *owe*. (2) The vowel sound commonly called short *o*, as in *odd*, *cob*, is really, as we have seen, the shortened vowel sound represented by *a* in *all*, *fall*. (3) The obscure short vowel sound heard in *dcne*, *son*, *ton*; this sound is usually represented by *u*, as in *dun*, *sun*, *tun*. (4) The sound of *u* in *rune*, for example, *move*, *prove*. (5) The same sound shortened, as in *wolf*, *woman*; the vowel sounds four and five are the sounds of the fifth vowel in a standard alphabet. (6) The sound usually rendered by broad *a* in *all*, *call*: examples, *order*, *former*, *north*.

O', in Irish proper names, a patronymic prefix corresponding to the Mac of the Highlands of Scotland; thus O'Connell means "the son of Connell." It is supposed to be a cor-

ruption of the Irish *ua* (Gaelic, *ogha*), meaning a grandson.

OAHU, ō-ä'ho or ō-wä'hoo, the northernmost large island of the Hawaiian group; length 38 miles, average width about 20 miles. It has an irregular coast line, several small harbors, one excellent harbor on the west coast, upon which Honolulu (q.v.), the capital of Hawaii, is situated. Two mountain ranges cross the island, and between is a large dry plain which is productive when irrigated. Mount Kaala, 3,890 feet, is the highest point on the island.

OAK APPLE, any large gall (q.v.) on an oak; specifically, in England, a spongy excrescence on the twigs of *Quercus pedunculata*.

OAK CROWN, ORDER OF THE. See ORDERS AND DECORATIONS.

OAK GROVE, BATTLE OF. After the battle of Fair Oaks or Seven Pines (q.v.) 31 May-1 June 1862, General McClellan remained inactive astride the Chickahominy, his advance but five miles from Richmond. In the last week of June Fitz-John Porter's corps of two divisions, with McCall's division, temporarily attached, was on the left bank of the Chickahominy and held the right of the line. Next on the left, across the stream, was Franklin's corps of two divisions and on Franklin's left, in the order named, Sumner's and Heintzelman's corps, of two divisions each. Keyes' corps, of two divisions, was in reserve. The effective strength of the army was 92,500 and McClellan was daily calling for more. Lee, including Jackson's command, which was near, stood between him and Richmond with 80,000 men. The bridges being repaired and the ground firm, McClellan, 25 June, determined to advance the left of his picket-line preparatory to a general forward movement. Immediately in front of the most advanced redoubt on the Williamsburg road was a large open field, beyond which was a swampy belt of timber of some 500 to 700 yards, which had been disputed ground for many days. Further in advance was an open field, crossed by the Williamsburg road and the railroad and commanded by a Confederate redoubt and rifle-pits. It was McClellan's intention to push his lines through these woods in order to ascertain the nature of the ground and to place Heintzelman and Sumner in position to support an attack to be made by Franklin on the 26th, on the rear of Old Tavern and which, if successful, would force Lee from the heights overlooking Mechanicsville and clear the way for a general advance on Richmond. The movement began about 9 A.M. by the advance of Hooker's division of Heintzelman's corps on both sides of the Williamsburg road, where a

mile separated the Union and Confederate works. Hooker was supported by Kearny's division on the left, and on the right by Richardson's division of Sumner's corps. The Confederate pickets were driven in, and Hooker struck Wright's and Armistead's brigades of Huger's division, which, with a part of Ransom's brigade, made a stubborn resistance and at 11 A.M., after Hooker on the right had advanced some 800 yards and Kearny nearly a mile, the entire Union line was ordered to fall back; Kearny, however, held on to the ground won. At 1 P.M. McClellan came upon the field and ordered a renewal of the advance. Hooker was reinforced by a brigade of Couch's division and advanced; Kearny joined in on his left. Mahone's brigade and the rest of Ransom's reinforced the Confederates and a severe fight ensued, lasting until dark. McClellan says he accomplished his object. The Confederates claim that McClellan was repulsed and gained no material advantage and that at night they occupied their old positions. This battle also known as that of Kings school-house, French's Fields and the Orchards, was the beginning of the Seven Days' Battles (q.v.). The Union loss was 67 killed, 504 wounded and 55 missing. The Confederate reports show a total loss of 441. Consult 'Official Records' (Vol. XI); Webb, 'The Peninsula'; Allan, 'History of the Army of Northern Virginia'; 'The Century Company's 'Battles and Leaders of the Civil War' (Vol. II).

OAK PARK, Ill., village in Cook County, nine miles west of Chicago (of which it is a residential suburb) on the Chicago and Northwestern Railroad. Formerly a part of the town of Cicero, it was incorporated as a separate village in 1902. Oak Park owns its waterworks and contains, in addition to handsome residences, several fine buildings. These include the Scoville Institute, the hospital of the Sisters of Misericordia, a public library and several schools. An annual horse show is held here. It is also a thriving manufacturing centre with at least 47 establishments whose products are estimated at \$1,555,000 annually. Pop. (1920) 39,830.

OAKELEY, Sir Herbert Stanley, English composer: b. Ealing, 22 July 1830; d. November 1903. He was educated at Rugby and at Christ Church, Oxford, studied music in England and at the Leipzig Conservatory under Moscheles and Plaidy and later devoted himself to the organ, working with Breidenstein in Bonn and with Schneider in Dresden. In 1858-68 he was musical critic to the 'Guardian,' in 1865-91 professor of music at Edinburgh and for many years composer to the Queen in Scotland, where he furthered orchestral and organ music and established Students' Choral Associations in the universities. His compositions are principally religious, including anthems, cantatas, hymn tunes, chants and service-music; but he also wrote some pieces for the pianoforte. He was knighted by Queen Victoria in 1876. Consult Oakeley, E. M., 'The Life of Sir Herbert Stanley Oakeley' (London 1904).

OAKEN CROWN, ORDER OF THE. See ORDERS, ROYAL.

OAKES, òks, Urian, American colonial scholar and clergyman, 4th president of Har-

vard College: b. England, 1631; d. Cambridge, Mass., 25 July 1681. He was brought to America in 1634, showed himself an able mathematician and astronomer when a mere boy, was graduated at Harvard in 1649, studied theology, preached for several years in England and in 1671 became pastor of the church in Cambridge and fellow of Harvard College. He became acting president of Harvard in 1675 and was inaugurated in 1680 as president. He wrote much Latin verse and a famous 'Elegy upon the Death of Thomas Shephard,' selections from which may be found in Tyler, 'History of American Literature.'

OAKLAND, òk'land, Cal., city, county-seat of Alameda County, on the eastward side of San Francisco Bay, opposite San Francisco, the Pacific Coast terminus of Southern Pacific, Western Pacific and Santa Fé railroads; port for trans-Pacific and coastwise steamship lines and for California River boats, connected with the State capital, Sacramento and with cities and towns up and down coast and in interior by a number of electric railways; chief cities and villages of county reached by interurban trolley lines. The city has 15 miles of waterfront, of which seven miles comprises a landlocked harbor along the southern boundary, known as the "estuary." This is navigable throughout for ocean-going vessels of the deepest draft. To the westward, the city has eight miles of waterfront along the bay shores already developed and in process of development. Here more than 400 acres has been reclaimed from the bay by dredging and moles and this land is much sought after for sites of factories desiring contiguous deep water. Jutting out from this western waterfront are three moles for railroad traffic to ferriesboats. These moles have been further reinforced by rubble stone jetties constructed by the Federal government. The army engineers have recommended the construction of an immense dike all along the western bayshore just outside of the pierhead line to divert the flow of the Sacramento River and provide a safe harbor of constant depth for deep sea shipping. Topographically, Oakland is set in an immense amphitheater, bounded on the north and east by the foothills of the Coast range, which rise almost to the height of mountains. These hills maintain an equable climate, shutting off the fogs and cold trade winds from the ocean and the heat from the interior valleys. The hills slope down to the bay in a series of benches, on which have been constructed streets and contour boulevards. These benches have been utilized for homesites, thus providing one of the most beautiful cities in the United States. The hills also provide an almost perfect natural drainage. That portion of the city next to the bay, about one-half its area, is practically level. The mean temperature for 1914 was 57.5°. In the same year the thermometer went as low as 35° in December and as high as 86° in March and September. Winter is the rainy season but it is not a disagreeable rain. Sometimes a light frost falls. In 1915 the number of clear days was 143, of fair days 118 and of cloudy days 104.

Though the county-seat of a great agricultural county, Oakland has forged rapidly to the front in the last few years as a manufacturing centre. This is largely due to its numerous in-

City Hall Square

dustrial sites, easily accessible to both water and rail lines, the contiguity of a cheap, unlimited fuel source in the crude petroleum pipelines at Richmond, 10 miles to the north and to the open climate which permits of industrial operations every day in the year. Oakland's principal industries are, fruit and vegetable canning, cotton spinning, shipbuilding, iron working, gas engine manufacturing and lumbering. A recent government census of Oakland manufacturing showed, capital invested, \$36,411,000; wages, \$5,966,000; value of products, \$28,522,000. The increases from 1909 were, capital, 90.5 per cent; wages, 12.2 per cent; value of products, 27.7 per cent. It is believed that since 1914 the manufactures have increased by a conservative estimate about 60 per cent.

There are 15 banks, with an aggregate capital on 1 Jan. 1915, of \$4,676,290, surplus, \$2,393,088 and deposits, \$55,340,000. Clearings in 1915 totaled \$181,471,320.

Some of the prominent buildings are, the City Hall, completed in 1914 at a cost of \$2,000,000; the Municipal Auditorium, completed in 1915 at a cost of \$1,000,000; the Hotel Oakland, \$1,125,000; the Claremont Hotel, \$1,000,000; the Athenian Club, \$200,000; the First Methodist Church, \$150,000; Saint Paul's Episcopal Cathedral, \$100,000; the Y.M.C.A. building, \$400,000. Oakland has 50 public schools, five high, of which one is polytechnic, 41 grammar and four evening. The city was the pioneer in outdoor schools and its recently constructed school buildings are so arranged as to be made into practically open-air classrooms. Saint Mary's College (Roman Catholic) for young men and Mills College for young women are accorded the highest rank among educational institutions of the Pacific Coast. There are also business colleges, music conservatories, engineering schools, etc. As a part of the public high school system is maintained Chabot Observatory, equipped with one of the largest telescopes on the Pacific Coast. There are 28 parks and nine playgrounds, totaling 500 acres. The park system centres around Lake Merritt, the largest salt-water lake inside a municipality in the world. Oakland has numerous scenic drives and boulevards, chief of which are the Skyline boulevard, along the crests of the hills back of the city; the Foothill boulevard, along the bases of the same hills; the Diamond Canyon road, leading to the "Hights," the home of the late poet, Joaquin Miller; the Tunnel road, running through the hills to the interior valleys. The Pacific Coast terminus of the Lincoln highway is at Oakland.

The \$50,000 Carnegie library, erected on a \$20,000 site, contains more than 125,000 volumes. The municipal reference library in the city hall is open to the public for obtaining information on technical subjects.

Oakland was settled in 1820 by Don Luis Maria Peralta and other Spaniards. It was incorporated in 1852 and chartered as a city in 1854. The commission form of government was adopted on 1 July 1911, providing for a mayor, who is president of the city council and commissioner of public affairs and commissioners of public health and safety, public works, streets and revenue and finance. Pop. (1920) 216,361.

OAKLEY, Violet, American mural painter: b. New York City in 1874. She studied at the

Art Students League in New York and also under Cecilia Beaux; at the Pennsylvania Academy of Fine Arts under Howard Pyle, the illustrator; and in Paris under Aman-Jean, Collin and Lazar. She first devoted her talent to illustration, but soon turned to mural painting and the designing of stained-glass windows. Her first important commission was for 13 panels depicting the 'Founding of the State of Spiritual Liberty,' for the governor's reception room of the State Capitol at Harrisburg, Penn., and nine panels, 'Creation and Preservation of the Union' for the senate chamber. Among her most important achievements are a series called 'Building of the House of Wisdom,' in the house of Charlton Yarnall in Philadelphia; a window, 'Divine Comedy of Dante Alighieri,' in the house of Robert Collier, New York City; a panel called 'The Constitutional Convention,' in the Court House, Cleveland, Ohio; and decorations in the church of All Souls and the church of All Angels, both in New York City. Miss Oakley has received gold medals from the Saint Louis Exposition (1904), the Pennsylvania Academy of Fine Arts (1905) and the Architectural League of New York (1916). A medal of honor was given to her at the Panama Exposition (1915) and also at the San Francisco Exposition (1915). She resides in Philadelphia and is a member of the Society of Mural Painters, the Society of Illustrators, the New York Water Color Club, the Philadelphia Water Color Club and a Fellow of the Pennsylvania Academy of Fine Arts. Consult Armstrong, R., 'Work as Illustrator,' *Critic* (June 1900); Morris, H. S., 'Work of Violet Oakley,' *Book Buyer* (May 1902); Morris, H. S., 'Violet Oakley's Mural Decoration,' *Century Magazine* (June 1905); Morris, H. S., 'New Motive in Decoration,' *Century* (1911); Coleman, C., 'Mural Decoration in the Pennsylvania Capitol,' *Architectural Record* (December 1897); Sturgis, R., 'Pictures in Harrisburg State House,' *Scribner's* (May 1907); 'Divine Comedy: Studies in Red Chalk,' *Century* (December 1912); and Portrait in *World's Work* (April 1912).

OAKMONT, Pa., borough in Allegheny County, 10 miles northeast of Pittsburgh, on the Pennsylvania Railroad. It is situated on the Allegheny River. A Carnegie library and a high school are the chief buildings. The industries are glass, iron and powder-works, tools of many kinds, pipes and fittings, hot-water boilers and structural steel. Pop. (1920) 4,512.

OAKS, a genus (*Quercus*) of trees and shrubs of the family *Fagaceæ*. The species, of which there are about 400, are characterized by alternate, simple, deciduous or evergreen leaves, inconspicuous monœcious flowers, the staminate usually in slender pendulous catkins, the pistillate usually nearly sessile and generally solitary or in groups of two or three and developing into "acorns" which are more or less globular or oblong nuts set in the hardened, scaly involucre (cup) which sometimes nearly surround them. Nearly all the species are natives of the northern hemisphere, especially the temperate and colder portions. Some species are natives of the warmer parts of the temperate zone, but few are actually tropical. Most of the oaks are noted for strength, durability, longevity and striking individuality of

appearance; and on account of these qualities they have been used as symbols by many races and enter into literature and tradition. Some of the species reach maturity only when 50 to 100 years old, and others even exceed this maximum before reaching a size suitable for lumbermen's purposes. Specimens are known which have reached nearly 1,000 years, and others of half that age are common.

Oaks are generally propagated by seeds planted as soon as mature in the autumn; choice varieties are grafted or budded; and evergreen species are often increased by means of cuttings or layers. In general they thrive best upon well-drained, fairly moist, loamy soils, especially such as are well supplied with lime. They are, however, found in all kinds of habitats, including almost pure sand, clay, rocky mountain sides and the mucky soils of undrained swamps. With few exceptions the valuable species are easily grown and readily transplanted while young.

Among the oaks are some of the most valuable trees of the temperate zone. Their acorns furnish a valuable food for swine, and in some instances are used for human food; their bark is one of the most important barks used in tanning; and their timber, which is noted for its solidity, strength, resistance to moisture and durability, is one of the most important woods of the world. It is used largely in shipbuilding, but less now than before the introduction of iron and steel vessels; in railroad and mill construction, bridge building, etc.; and, because of its handsome graining and its ability to receive polish, it is extensively employed in interior finish of houses, in furniture, etc. The galls which grow upon certain species and the bark are widely used as a source of tannin for ink manufacture. Some of the more rapidly growing species are planted largely in Europe in copses, the stems being cut every few years for fuel and for the bark. Few trees are more highly prized by horticulturists and landscape gardeners; but usually the specimens must be in place before the gardener lays out the ground, because with most species little effect can be expected under 10 years. For this reason other trees of quicker growth are planted with oaks and are removed when the oaks need the space.

About 50 species and half as many hybrids and varieties are natives of the United States, some extending from Nova Scotia to Minnesota and southward to the Gulf States, others being limited to very restricted localities. In general these species belong to two groups, the black oaks and the white oaks. Those of the first group have leaves with pointed tips and acorns that require two years to reach maturity; those of the second have leaves with round lobes and acorns which reach maturity the first year. The most important species is probably the white oak (*Quercus alba*), which has the full range mentioned above. It attains a height of 100 feet, has broadly-spreading branches which form an open rounded head, and the light gray bark which gives it its name. It is one of the handsomest of its genus, and being of rather quick growth for an oak, and remarkable for its statelyness, it is often planted in parks. Its timber being compact and remarkably handsome, is one of the most prized for furniture. The mossy-cup or bur oak (*Q. macrocarpa*) re-

sembles the white oak in size, appearance and distribution, but its timber, being of coarser grain, is less valued. The chestnut-oak (*Q. prinus*) is a smaller tree, with a broad irregular head and dark brown bark deeply furrowed and with leaves like those of the chestnut. It ranges from Maine to southern Michigan and Pennsylvania. It is especially valued for its bark, which is exceptionally rich in tannin. The live oak (*Q. virginiana*) is a broadly spreading tree, seldom more than 60 feet tall. It is noted throughout its range, which extends from Virginia southward, for its glossy, dark green leaves and its dense shade, for which it is widely planted in the South for ornament. It is usually draped with Spanish or Florida moss, which also adds to its striking appearance. The red oak (*Q. rubra*) which has a range similar to the white oak, is a rapidly-growing, handsome tree, sometimes reaching 150 feet and forming a broad round head. Its timber is very heavy, durable and hard, but is coarse-grained. It is less used for the finer work than the white oak. A close relative, the scarlet oak (*Q. coccinea*), is smaller than the preceding, but is similar in range, uses, etc. Both kinds are remarkable for their autumn colors. The water-oak (*Q. aquatica* or *nigra*), popularly known as the black or dyer's oak, is common from Delaware southward to the Gulf States. It attains a height of 80 feet, and being of rapid growth it is frequently planted as a street tree in the South. In the North it is not hardy.

The European or British oak (*Q. robur*) is a native of western Asia and northern Africa as well as of Europe. About 50 horticultural varieties of this species are in cultivation for ornament, some being introduced into America for this purpose. This is the oak of legendary lore, under whose branches the ancient Druids held their religious ceremonies. It is also the oak used by the navies of Europe for more than a thousand years. The cork-oak (*Q. pseudo-suber*) is a native of the Mediterranean region and is noted for its bark which furnishes the cork of commerce. The gall-oak (*Q. lusitanica*) is a shrub, native to western Asia, and is chiefly useful for its nut-galls (q.v.), which occur upon the leaves as the result of insect attack. The Valonia oak (*Q. agrilops*), common in the same region, is noted for the astringency of its acorns, which are largely used in tanning. The holm, holly or evergreen oak (*Q. ilex*) is a native of southern Europe and bears acorns used for food.

A very large number of insects live upon the oak, its timber and its decaying wood. One estimate for the United States places this at 1,000; the number actually recorded being between 500 and 600. In Germany, according to Kaltenbach, there are 537. These belong to all orders and include borers, leaf-chewers, sap-suckers and fruit-eaters. Among the most noted are the oak-tree pruner (*Elaphidion villosum*), a beetle which lays its eggs in the twigs, in the pith of which the larvæ feed until nearly mature, when they chew out a ring of wood nearly to the bark, retire to the semi-severed twig, plug up the burrow and pupate. The wind snaps the twigs, hence the name. Many gall-forming insects, plant-lice, leaf-miners, scale-insects and leaf rollers feed upon the leaves, which are also often attacked to a

damaging extent by the larvæ of numerous lepidopterous insects. Some of the curculios are frequent pests upon the acorns, which are rendered useless for stock food, because their contents have been eaten by the larvæ. Perhaps the most serious pests, however, are the borers, of which there are a large number. These may retard the development of the trees or may so injure the wood by their burrows as to make it unfit for purposes where strength and appearance are necessary. Consult Packard, 'Fifth Report, United States Entomological Commission' (Washington 1890).

OAKUM, in shipbuilding, threads of hempen ropes picked to pieces, to be used when mixed with pitch for caulking the seams of wooden vessels. Until recently old men, women and children were employed to pick oakum, but this is now chiefly done by machinery. The rope or junk is old rigging and cables bought up for this purpose. It is first cut by a powerful knife into short lengths, and these are thoroughly steamed to dissolve out the tar. The strands being then pulled apart, they are spread in the sun to dry. After this they are torn in pieces and cleaned of dust in carding machines, a succession of which are used, until the oakum is obtained in clean light fibres. Since the passing of the wooden ship oakum is very little in demand.

OAKVILLE, Canada, town in Halton County, Ontario, 21 miles southwest of Toronto, on Lake Ontario and on the Grand Trunk Railroad. Appleby School for Boys is situated here. An electric railway connects Oakville with Hamilton. The town owns its waterworks and electric-lighting plant. The industries are planing-mills, boat-building, tanning, aluminum ware, evaporators, baskets and leather. Oakville is a favorite summer resort. Pop. (1914) 2,972; in summer 3,500.

OANNES, ō-ān'nēz, in Babylonian mythology, a god of the sea, described as having the head and body of a fish, to which were added a human head and feet. In the daytime he lived with men to instruct them in the arts and sciences, but at night retired to the ocean.

OAR FISH, or **BAND-FISH**, one of the ribbon-fishes (*Regalecus banki*), a peculiar deep-sea fish, 12 to 20 feet or more in length, with a narrow and extremely compressed body of a silvery color. The dorsal fin extends the whole length of the back and the anterior part is like a mane. The ventral fins are thoracic and are much reduced in width. The fish is found in all oceans and is probably responsible for most reports of sea-serpents. It is only rarely met with and usually in a dying condition, as its proper home is in the depths of the sea.

OÁS, ō-ās', Philippines, a town in the province of Albay, Luzon, situated in the Inaya River, 15 miles northwest of Albay, the provincial capital. It is on the main road between Ligao and Polangui, has a considerable river trade and is the centre of one of the finest hemp-growing districts of the province. Pop. 17,200.

OASIS, a fertile place in a desert, usually found where lack of vegetation is caused by lack of moisture. Some of the mountains in the Sahara are of sufficient height to cause

condensation of moisture and rainfall; and as much of the soil has all the ingredients necessary for productiveness, an oasis is formed. Springs sending out enough water to moisten the soil aid in the formation of fertile spots; and artificial means are now used; the artesian wells are assisting in making productive places in the Sahara. See SAHARA.

OASTLER, ōst'lēr, Richard, English reformer: b. Leeds, England, 20 Dec. 1789; d. Harrogate, England, 22 Aug. 1861. In 1820 he succeeded his father as steward of the Fixby estates at Huddersfield, Yorkshire. In 1830 his attention was called to the evils of child labor in the factories and he started a campaign against the conditions by a vigorous letter to the Leeds *Mercury*, entitled 'Yorkshire Slavery.' After many years of agitation the Ten Hours Bill and other acts ameliorating factory conditions were passed. Oastler's energetic work gave him the title of 'The Factory King.' Owing to his opposition to the new poor law he was dismissed from Fixby and in 1840 being unable to repay his employer a loan of £2,000 the latter had him imprisoned for debt in the Fleet. Here he remained nearly four years, meantime publishing the *Fleet Papers*, a weekly journal discussing the factory and poor law questions. The working-men of England and Oastler's personal friends raised the money to pay his debt and he was released in 1844. He was triumphantly received on his return to Huddersfield. In 1869 a statue to his memory was erected at Bradford. In 1851-55 he edited a weekly newspaper called the *Home*.

OAT GRASS. See GRASSES OF THE UNITED STATES.

OATES, ōts, Titus, notorious English perjurer, the fabricator of the story of the Popish Plot: b. Oakham, 1649; d. London, 12 July 1705. The son of a clergyman of the Church of England who had become an Anabaptist preacher and in 1654 was expelled from a chaplaincy in the Parliamentary army, he was turned out of successive schools and took no degree at Cambridge, but was ordained and became vicar of Babbing in 1673. Soon after he was vicar to his father, with whom he circulated such outrageous stories against a schoolmaster of the parish that they were expelled from the living. After various ups and downs, about 1676 he conceived the idea of informing against the Roman Catholics; he became a Roman Catholic in 1677, studied at Valladolid and Saint Omer, but was expelled from both, and 1678 gave information as to a Popery Plot against Charles II, intended to seat upon the throne James, Duke of York, and turn the country over to the Jesuits. He received a large governmental pension and his story was implicitly believed, resulting in the judicial murder of 35 innocent persons. But in two years the excitement somewhat subsided; and upon the accession of James II, Oates' pension was withdrawn and he was put on trial for perjury, was found guilty, fined, condemned to stand in a pillory, and be imprisoned for life after a terrible flogging, which he survived as by a miracle. His sentence was reversed after the accession of William and Mary; he was set free and received an annual pension of £300. In 1693 he

married a rich widow and a few years later joined the Baptist congregation and preached among them, but was soon expelled. Consult North, Roger, 'Examen,' and 'Lives of the Norths'; Seccombe, Thomas, 'Lives of Twelve Bad Men' (1894); Burnet, 'History of My Own Time' (1883); and the English histories of Hallam, Lingard and Macaulay.

OATH, Military, a solemn or formal appeal to God (or to any deity), in witness of the binding character of the promise, made by each recruit at the time of his enlistment. Among ancient nations and races the oath also imprecated divine vengeance if the swearer should be guilty of a falsehood or violate his promise. When the law took his most solemn oath he laid his hand on the book of the law and swore by the God of Israel. The ancient Scandinavians and Teutons swore by their gods and laid their hands on some special object of veneration—a bloody ring held by the priest, or touched their swords or beards as they took the oath.

The Roman term for the military oath of allegiance was originally the preliminary engagement entered upon with the general by newly-enlisted troops (Cicero Off. 1, 11, 36; Livy, XXII, 38, 2). The oath was taken first by the legates and tribunes. Officers then administered it to the soldiers in the following manner—one soldier in each legion recited the formula of the oath, and the rest were called off by name; and coming forward one by one swore to the same oath *idem in me*, i.e., "The same holds good for me." The oath remained in force only till the next campaign; and whenever there was a new general a new oath was taken. After the introduction of the 20-years' service by Marius (about 100 B.C.), the men raised for service took the oath, not one by one, but all together and for the whole time of service, in the name of the state, afterwards in that of the emperor. In early Christian times oaths were administered in chapels and other holy places at the altars which were occasionally rendered more sacred by placing upon them holy relics. William the Conqueror, when he made his prisoner Harold swear to aid him in ascending the throne of England, secretly conveyed under the altar on which Harold had agreed to swear the relics of some of the most revered martyrs; and when Harold had taken the oath he was admonished to observe religiously an engagement which had been ratified by so awful a sanction.

Military knighthood in the days of chivalry—that originated between the time of Charlemagne and the Crusades—was subject to much form and ceremony. Many arms were never received without a regular investiture, which became a general practice in the 11th century. Many of the orders of knighthood had their own special oaths.

The military oath of the present day consists of an enlistment contract, which is signed by the recruit. In the United States army the enlistment contract signed by the recruit is as follows: "I, N, born in — in the State of —, aged — years and — months, and by occupation a —, do hereby acknowledge to have voluntarily enlisted this — day of — 19—, as a soldier in the Army of the

United States of America, for the period of — years in active service and in the Army of Reserve for the periods and under the conditions prescribed by law, unless sooner discharged by proper authority; and do also agree to accept from the United States such bounty, pay, rations, and clothing as are or may be established by law. And I do solemnly swear (or affirm) that I will bear true faith and allegiance to the United States of America; that I will serve them honestly and faithfully against all their enemies whomsoever; and that I will obey the orders of the President of the United States and the orders of the officers appointed over me, according to the rules and articles of War." A somewhat similar formula is subscribed by the recruits of foreign armies. An oath is also administered to officers at the time of their being commissioned and also in some cases where the performance of special duty is assigned them. It is not so picturesque as the verbal oath, but it is no less binding. See KNIGHTHOOD; LAW, MILITARY; ARMY; NAVY; UNITED STATES.

OATHS AND AFFIRMATIONS (Judicial). A judicial oath is a solemn declaration made in some form warranted by law, before a court of justice or some officer authorized to administer it, by which the person taking it promises to tell the truth, the whole truth and nothing but the truth, in relation to his knowledge as to the matter then under consideration, and appeals to God to witness his sincerity. It is distinguished from an extra-judicial oath in the fact that the latter is not made under any warranted form of law, and has no binding force, except in the conscience of the one taking the oath. An affirmation is made in place of an oath by a person conscientiously opposed to an oath, and it is a declaration which is equivalent in law to an oath. Oaths are of extremely ancient origin, and are not peculiar to Christianity, having been used by many nations of the world. Affirmations in place of oaths were the result of a statute first enacted in England for the benefit of those to whom the invocation of the Deity was objectionable. Generally under the present laws, only those persons included within the statutes permitting an affirmation to be made in place of an oath have such right. Authority to administer oaths is an incident to judicial officers. All persons having sufficient intelligence to appreciate the nature of an oath and believing in the existence of a Supreme Being, who demands a moral obligation to speak the truth when under oath, are competent to take an oath.

In nearly all of the United States, through statutory enactment, it is provided that every person believing in a religion, not the Christian religion, may be sworn according to such ceremonies as his religion may have; a substantial compliance with the provisions of the statute as to the form of an oath is usually sufficient, the test generally being as to whether or not the person taking the oath would be liable for punishment for perjury in the event that such oath had been violated. Any person lawfully required to depose the truth, and making a wilful false oath on any material point, whether he believes it or not, is subject to be held for perjury, and punishment therefor in accordance

with the statutes under which he may be indicted. See also EVIDENCE; LAW, CRIMINAL; WITNESS.

OATS, various grasses of the genus *Avena*. The best known species is often subdivided into Tartarian oats (*A. orientalis*) and common oats (*A. sativa*). In the former variety the panicles are one-sided and somewhat contracted; in the latter they are loose and spreading. The origin of common oats is in doubt, but many writers suppose that they are derived without hybridizing from a Tartarian species now unknown to botanists. The numerous varieties of this species vary greatly in color, size of grain, height, etc., and more or less in composition. Other species are cultivated to a small extent but are mostly considered weeds. The best known of these are probably animated oats (*A. sterilis*) whose seeds move with varying amounts of moisture; wild oats (*A. fatua*) valued in some places, for example, California, for pasturage, but generally regarded as a noxious weed; bristle-pointed oats (*A. strigosa*) used sometimes like the preceding but also considered a weed; and short oats (*A. brevis*) cultivated at high altitudes for its seed which matures where other cereals fail.

Oats succeed well upon a great variety of soils if these are well supplied with moisture. They will not do well in wet soil nor in hot countries, though in warm regions they succeed if the soil is moist enough. They thrive best in temperate climates, in many of which they rank as one of the most important cereal crops. The land is plowed and harrowed usually in spring and the seed either sown broadcast or drilled in at the rate of about three bushels to the acre. In the western United States the seed is commonly sown broadcast upon cornland which has been prepared only with the harrow. In the eastern States the ground is usually plowed previous to sowing. Since the plants are very hardy the seed may be sown as soon as the ground can be worked in spring, a practice which insures an early development of the plants under favorable conditions. In about three months the harvest usually occurs in northern countries; in southern regions a somewhat longer time is necessary because of the shorter days and usually drier conditions. Though the average yield per acre in the United States was, during the last decade of the 19th century, 26.14 bushels, yields of more than 50 bushels are common under good management, especially in Europe. The world production is about 4,600,000,000 bushels per annum. The 1914 production of the United States was 1,141,060,000 bushels; the production of Europe is about 2,700,000,000 bushels. Russia, Germany and France, in order named, are the largest European producers.

Oats are rather exempt from the attacks of specific insect enemies; and the means of combating the general cereal enemies are the same as for wheat, barley and other grass and grain insects. They are subject to the attacks of several so-called plant diseases, of which the best known are rust and smut. Since these are less troublesome upon early maturing varieties, these are chosen in regions which seem to be infested. They also have another advantage in that they are less likely to lodge than taller and later growing varieties.

The oat has long been considered one of the most valuable of cereal grains. Treated as a grass it makes an excellent forage, fodder or hay; and as a grain it is one of the standard feeds for domestic animals, particularly the horse, and is widely used as human food, especially for making porridge. In the manufacture of what are called "breakfast foods" the oat takes an important part, and the by-products, such as hulls (the outer covering), bran, middlings, and "oat dust" are largely sold to stockmen for mixing with other feeds. The whole grain has the following average composition: Nitrogen-free extract, 59.7; protein, 11.8; water, 11.0; crude fibre, 9.5; fat, 5.0; ash, 3.0. Since analyses have failed to reveal the presence of a supposedly stimulating principle called "avenin," chemists and other investigators have concluded that such a principle does not exist.

Consult Morrow and Hunt, 'Soils and Crops of the Farm' (1892); Hunt, 'The Cereals in America' (New York 1904), and *Farmers' Bulletins* Nos. 424 and 426 of the United States Department of Agriculture and books upon general farming.

OAXACA, wā-hā'kā, Mexico, state, bordering on the Pacific Ocean, and bounded on the north, east and west by the states of Puebla, Vera Cruz, Chiapas and Guerrero. Area about 28,778 square miles. The principal mountain ranges are the Sierra Madre, which crosses the whole state, and Sierra del Sur, near the coast. See MEXICO—THE STATES OF.

OAXACA, or **OAXACA DE JUÁREZ**, dā hoo-ā-réz, Mexico, capital of the state of the same name. The situation, in the midst of a fertile valley, the rivers Atoyac and Jalatlaco flowing through it out into the Oaxaca valley, is most attractive. It is 288 miles southeast of Mexico City, by railway, and is 5,067 feet above sea-level. It enjoys an unlimited supply of pure water, by means of two aqueducts, one of which was built in 1755 and the other in 1880. Transportation facilities are supplied by the Mexican Southern and Oaxaca and Ejutla railways. There is a local bank,—the Bank of Oaxaca,—which, together with branches of the National Bank and the United States Banking Company, and an agency of the Bank of London and Mexico, supply the financial needs of the community. Within the last few years the city has assumed much prominence as a base of supplies and headquarters for the many and rapidly developing mines of the State. The streets are laid out somewhat like those of Washington, are lighted by electricity and are well paved and clean. The general style of architecture is Spanish, and the most notable edifices of interest are the Government Palace, the Palace of Justice, the Municipal Palace, Federal Building, Museum and Institute of Science and Art, the Normal School, State Hospital, Charity Hospital and the Municipal Necropolis. The educational institutions include a number of primary schools, the State Institute of Science and Art, in which are taught jurisprudence, medicine, obstetrics, pharmacy, telegraphy and business methods; the Normal School for Men and the Normal School for Women, in which both primary and advanced instruction is given. Two museums—the Oaxaqueño and the Fernando Sologuren—are

devoted to the investigation and study of archaeology and the natural sciences. The cathedral of the city, founded in 1553 and rebuilt in 1730, is an imposing edifice of gray stone. There are many public gardens or parks—among them the Zocolo, Guadalupe, San Francisco, Netzahualcoyotl and the Constitution. The city is believed to have been an important place long before its discovery by the followers of Cortez, by whom it was occupied in 1521. It was constituted a city by royal charter in 1532 and given its present name, Oaxaca de Juárez, in 1872. Here were born and reared several of the greatest men of Mexico; among them being Porfirio Díaz; Ignacio Mariscal, Mateos Romero, many years Minister of Mexico to the United States; and in a poor little hamlet not far distant, Benito Juárez. Pop. about 42,000.

OAXACA, Ruins of. Architectural remains found on the mountain tops around the city of Oaxaca in southern Mexico, which was founded by the Zapotecs in 1486 under the name of Huaxyacac and occupied by the Spaniards in 1522 who named it Antequera. Oaxaca is noted for two of the most noted ruin-groups in Mexico. The principal ruins are those of Mitea, the burial city of the priests and kings of the ancient Zapotecs, which show quite a distinct character, although presenting certain analogies to the Mexican. One of the chief structures is a step-pyramid rising in three steps to a height of 130 feet. Another is a pyramid of brick. Besides these there are courts surrounded by palaces which were necropolises, dwellings of the priests, chief priest and of the king. The latter's dwelling has an audience hall. The wall paintings of the palaces are remarkable. The deities are those of the Mexican pantheon.

Mitla, once a marvelous city, is now built over by a modern Indian village and, with the exception of half a dozen of its greatest temples, is practically destroyed. Mitla is 29 miles by stage to the southeast of Oaxaca on the Tehuantepec highway.

The other ruin group is situated upon Monte Alban (6,245 feet), a few miles west of Oaxaca. Monte Alban is a mountain ridge about a thousand feet high, one mile long and a quarter of a mile wide, which has been remodeled by the hand of man into terraces, plateaus and pyramids. As it stands to-day it is in its outlines an artificial mountain and an astonishing monument to the energy and culture of the ancient races.

The ruins of Monte Alban were explored by Garcia in 1855, by the German traveler Müller in 1857 and by Charnay in 1858-59. W. H. Holmes, who made a careful study of Monte Alban in 1896, came to the conclusion that it was originally a hill-top city occupied by people who made use of the valley and mountain slopes for their crops and gardens.

"About Oaxaca," this archaeologist writes, "many of the important architectural remains are found on the mountain tops, and one soon comes to recognize the notched profiles of the ridges and peaks that border the valley as being due to the strangely directed enterprise of the ancient inhabitants. The feeling of surprise induced by this discovery is followed by one of amazement as the real nature and extent

of the work dawns upon the mind. As the explorer climbs the slopes and picks his way from summit to summit, he is fairly dazed by the vast array of pyramids and terraces, which not only crown the heights but overspread the steep slopes, destroying traces of natural contour and making the mountains actual works of art." The greatest of the works covers an area of about 3,400 feet by 1,200 feet and consists of a vast series of level courts inclosed by terraces and flanked by pyramids. The corners of the quadrangles are ornamented by pyramids and in the centre rises a mound. Some of these pyramids are 400 feet square and rise to a height of 40 feet to the summit, which is 300 feet square. The builders not having large stone used a mixture of adobe and small stones, faced with rough blocks, sometimes with dressed masonry, and covered with cement on the outside. Cement floors are observed in the ruins and much interesting sculpture. "The chain of pyramids," says Mr. Holmes, "extending from north to south along the middle of the great square, constitutes one of the most interesting features of these remains. How striking must have been the effect when these pyramids were all crowned with imposing temples, when the great level plateau about them, 6,000 by 1,000 feet in extent, was brilliant with barbaric displays, and the enclosing ranges of terraces and pyramids were occupied with gathered throngs. Civilization has rarely conceived anything in the way of amphitheatric display more extensive and imposing than this.

The museum of Oaxaca has a large collection of objects taken from Monte Alban. The American Museum of Natural History has carried on explorations in this region and owns a valuable collection of antiquities from the valley and Oaxaca, Mitla and Monte Alban illustrative of Zapotecan culture. On Monte Alban have been found pottery similar to the ware now sold in the Oaxaca market; amulets of jadeite and other hard stone and a few gold and silver objects. It is supposed that the Monte Alban ruins are older than those of Mitla and that Mitla flourished in the 6th century A.D. Consult Charnay, 'Les Anciennes Villes du Nouveau Monde' (Paris 1885); and 'Cités et ruines américaines' (Paris 1863); Seler, E., 'Wandmalereien von Mitla' (Berlin 1895); 'Führer von Mitla' (Berlin 1906); Bandelier, A. F., 'Report of an Archaeological Tour in Mexico in 1881' (Boston 1884); Holmes, W. H., 'Archæological Studies among the Ancient Cities of Mexico' (Chicago 1897); Saville, M. H., 'Exploration of Zapotecan Tombs in Southern Mexico' (Washington 1899).

OB, öb, or OBI, õ'bë, Siberia, a great western river with its head-streams, the Biya and the Katun rising in the Altai Mountains within the frontiers of the Chinese dominions. The river flows northwest and north for 2,500 miles through level country to the Arctic Ocean, which it enters by three mouths at the great Gulf of Ob, an inlet of the Kara Sea, between Nova Zembla and the mainland. It extends between lat. 64° 30' and 72° N., and long. 68° and 77° E., and is ice-bound from October to June. The chief tributaries of the Ob are the Irtysh, Tcharysh, Tom and Tchulym, all navi-

gable. On the banks of the Ob are the towns of Barnaul, Tomsk and Tarym. At present only a few steamers ply on the great water-system of the Ob, of which over 9,000 miles are navigable.

OBADIAH (Hebrew, "Obadyah," meaning "servant" or "worshipper" of Yahweh, a prophet and poet of Israel, author of 'The Vision of Obadiah,' the fourth book of the minor prophets in the Jewish canon. Nothing is known of the prophet, except this short composition. A single chapter contains the whole utterance which is distinguished by its lyrical point and symmetry. It was probably written between the destruction of Jerusalem in the year 588 B.C., and the Conquest of Idumea about five years later, by Nebuchadnezzar. The Edomites, the progeny of Esau, were the great enemies of Israel. Noted for sagacity and worldly learning they imagined themselves quite secure in their hill fastnesses and rocky strongholds. Hebrew prophets often anathematized them as the type of earthly powers that defy God and his kingdom. As described in Psalm cxxxvii, 7, they had proclaimed their malicious joy over the destruction of Jerusalem, and the sufferings of their Hebrew brethren carried into captivity to Babylon. The remembrance of their insults and cruelty rankled and Obadiah in a poetic vision, with dignified protest earnestly warns them to cease from this unfeeling persecution, urging that Jehovah's punishment on all nations is at hand. When the day of wrath comes Judah will unite with Joseph, bring Edom to destruction and regain possession of its hereditary domain, a prophecy which was remarkably fulfilled. See OBADIAH, BOOK OF.

OBADIAH, Book of. Several verses of this book stand in some close relation with a portion of Jeremiah. The following verses of Obadiah are largely identical with the corresponding verses in the 49th chapter of Jeremiah, but with some variations: Obadiah v, 1-4, 5, 6, 8 = Jeremiah xlix, 14-16, 9, 10a, 7. The possibilities are that Obadiah has quoted from Jeremiah, that the quotation is in the reverse order, or that both have quoted from an older oracle. A careful comparison makes it exceedingly probable that Jeremiah has quoted from Obadiah, principally because the arrangement is more natural in Obadiah and the material much more condensed. Hence, so far as Obadiah is concerned, the relation to Jeremiah may be dismissed. If chapter 49 belonged to the actual oracles of Jeremiah that might help to fix the date of Obadiah. But it is generally agreed that the oracles concerning the nations in Jeremiah xlv-li are considerably later than Jeremiah. Hence the date of Obadiah is to be fixed quite irrespective of Jeremiah.

It is evident, however, that Obadiah quotes an older oracle, introduced by the statement in verse 1, "we have heard tidings from Yahweh." This older oracle consists of verses 1-4. This was a prediction of destruction to Edom, given by an unknown prophet. It was delivered, doubtless, before the destruction of Jerusalem in 586, for there are no allusions to the activity of Edom in connection with that event.

There seems no reason to doubt that substantially the remainder of the book is by Obadiah, although some have questioned this. The prophet in verses 5-9 indicates that the

older oracle is now being fulfilled. He goes on later to predict further destruction for this nation, in connection with the general judgment upon the nations in the day of Yahweh, verses 15-16. The outcome will be that Israel will come to possess the land of Edom, verses 19-21.

The date of Obadiah is evidently after the destruction of Jerusalem in 586, for that is the event described in verse 11. It was also, evidently, when disaster had begun to come upon Edom. This was doubtless the series of disasters at the hands of the Nabateans. In 312 B.C. the Nabateans had occupied the Edomite capital, Petra, and driven the Edomites northward, this being the culmination of a movement begun quite a long time before. It is probable, therefore, that the date of Obadiah was in the 5th century B.C.

Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

OBALDIA, José Domingo de, President of Panama: b. David, province of Chiriqui, 1845; d. 1 March 1910. He was the son of the President of Colombia, was educated at the Institute de Christo in Bogotá and completed his education in the United States at French's School, New Haven, and in New York. Returning to Panama, he became interested in agriculture and stock-raising and accumulated a fortune. In 1900 he was elected to the Colombian Congress and in 1903 was made senator and also in that year was made governor of the province of Panama, then under the rule of Colombia. He joined in the revolution of 1903 which achieved the independence of Panama and was made second vice-president of the new Republic. In 1904 he was appointed minister to the United States, where as a member of the governing board of the Pan-American Union he labored for the cause of Pan-Americanism. Returning to Panama he was elected first vice-president of Panama and served as acting president during the absence of President Amador in Europe. Two years later (1908) he was made President, the candidate of the Liberal party. He died during his term of office. He endeavored to give the country a good administration. Obaldia was a man of wealth, owned ranches in Panama and large interests in Costa Rica and other Spanish-American countries.

OBAN, Scotland, seaport, fashionable watering place and municipal and police borough of Argyllshire, 20 miles northwest of Inveraray and 113 miles northwest of Glasgow by the Caledonian Railway and by the Crinan Canal. It is situated on the Bay of Oban, an arm of the Firth of Lorne, whence it takes its name Obe-an, "little bay." The island of Kerrera (four miles long and two miles wide) screens it from the Atlantic gales and makes it almost a land-locked harbor. Moreover, as it nestles at the foot of mountains of Mull, which rise picturesquely north and east of the town, an exceptionally mild climate for the latitude is

enjoyed here. Oban is, therefore, a favorite resort for tourists in the west highlands. From the constant influx of visitors arriving by rail, yacht and steamer the place is called the "Charing Cross of the Highlands." When Dr. Johnson visited this place during his tour through the Hebrides Oban was a tiny village. To-day it is a bustling little seaside town containing hotels, banks, shops, churches, piers and public park. At the north end of Oban Bay, on a high bluff looking over the sea, stands the ruin of Dunolly Castle. It dates from the 12th century and was the stronghold of the MacDougalls, Lords of Lorn. It still belongs to the family whose modern house occupies a sheltered nook below it. The chief exports are sheep products and whisky. Pop. 5,600.

OBANDO, ō-hān'dō, **José Maria**, Colombian general: b. in García, 1797; ; d. 27 June 1861. At the age of two years he was abducted and carried to Popayan where he was adopted by a gentleman named Obando. His origin is unknown. At first he served in the Spanish army as a guerilla and obtained the rank of lieutenant-colonel. In 1822 he joined the Revolutionists and rendered great service under Bolivar in the province of Pasto. In 1828 he opposed Bolivar and headed a Liberal revolt against the dictatorship of Urdaneta and defeated the dictator at Palmira (1831). He then formed a constitutional government for the Republic of New Granada, was secretary of war and marine, and in 1832 went to Ecuador to negotiate a treaty of peace. In 1838-41 he led a rebellion against Marquez but was defeated and exiled. When his party was restored to power in 1849, he became a member of the congress and secretary of the chamber of deputies. In 1850 he was made governor of Cartagena and in 1852 President of the republic. In 1854 he was overthrown and exiled. In 1860 he was recalled and commissioned to suppress a revolution in Cauca and in defense of the federation against the Revolutionists or Centralists, died on the battlefield of Cruz Verde.

OBEAH. See FETISH; OBI.

OBDIANCE, from the Latin *obedire*, to obey, is submission to the rule of another; the action of doing what one is bidden to do; the compliance with or the performance of a command. Obedience is also abstaining from what is prohibited in compliance with a command or prohibition. "Obedientia est legis essentia" (obedience is the essence of the law) says Coke. Obedience (ecclesiastical) in canon law, means the duty by which the various gradations in ecclesiastical organization are held subject, in all things consistent with the law of God or of the Church, to the several superiors placed immediately above them, respectively in the hierarchical scale. Thus priests and inferior clergy owe canonical obedience to the bishop; and bishops, by the present law of the Roman Catholic Church, take an oath of obedience to the Pope.

In ecclesiastical history the word obedience has a special signification and is applied to the several parties in the Church who during the great western schism adhered to the rival popes. The "Roman obedience" in those days designated all those who adhered to the Pope chosen at Rome and the "Avignon obedience" meant

the supporters of the Avignon Pope. Historians speak of the "obedience of Gregory XII," the "obedience of Benedict XIII" and so on. Applied to a monastic institution the word obedience signifies the voluntary submission which all members of religious orders vow to their superiors and to the rules and constitutions of the order.

The word obedience is also used to designate a place or office with the estate and profits belonging to it, in a monastery subordinate to the abbot and corresponding to a dignity in a cathedral or collegiate church. The "obedientiales" were usually the sub-prior, precentor, cellarer, sacristan, chamberlain, kitchenier, infirmarer, keeper of annals, hostler, almoner, pitanciar, lumberer and master of the lady chapel. The obediences varied according to the size of the monastery. Sometimes the gardener, fruiterer or keeper of the orchard was included.

The word obedience is also given to the written precept or formal instrument by which a superior of a religious order communicates instructions to a subject, for example an instruction to undertake a certain mission, to relinquish an appointment.

The word obedience is also the name given to those rooms containing the materials for the different kinds of works which the nuns executed. There were a great many of these obediences at Port Royal, for example "obediences for the linen, the robbery, the mattresses, the bedding, the furniture, the drugs, the apothecary's shop." An archaic definition of obedience is a salutation, bow or curtsy—*obeisance*. People "made obedience" to the throne; they "made obedience" on entering a room; and they "made obedience" on meeting each other.

OBELISK (Greek *ὀβελίσκος*,) *obeliskos*; diminutive of *obelos*, "a pointed instrument," "a spit"; Egyptian  *teken*, possibly related to the Hebrew *תָּקַן* *tokan*, "to make even," "level"; Arabic, *Misallat*, "a darning needle"; hence Cleopatra's needle. The Obelisk represents the Sun. The ancient Egyptians were sun-worshippers: they regarded the great luminary as the creator of the universe, the maker of all the gods above and below, and even as the author of himself. The sun as *Ra*, the great god of the Egyptians, was represented upon the monuments by the solar disc. In time several other names and attributes were applied to him. The rising sun was called *Har-em-khu*, "Horus on the horizon." During his daily course he was *Ra*, "the life-giver" representing day, light, etc. The setting sun, the symbol of night, darkness and death, was worshipped as *Tum* or *Temu*. When the number of deities in the Egyptian pantheon multiplied, *Ra* appeared upon the monuments and in the papyri under different forms and names, and is represented alike by animate and inanimate objects. The two most striking and characteristic monuments which represented him on earth were the obelisk and pyramid. The obelisk symbolical of light and life, represented his daily course; the pyramid, symbolical of darkness and death, the setting sun.

Ra was praised as "the Double Obelisk" and the "Double Sphinx" deity (Budge, 'The Gods of the Egyptians,' Vol. I, p. 348). The double

sphinx is the symbol of his early rising, and is called *Har-em-khu*, and according to the 'Book of Dead' (q.v.) is the symbol of resurrection. The obelisk is the technical figure of one ray or pencil of light emanating from the sun.

The material chosen for the obelisk was generally red granite, or syenite—a few, however, being of hard sandstone. The former was procured from the granite quarries at Syene (the modern Assouan). Red granite, some Egyptologists think, was chosen for two reasons: First, as being the most durable material, fitly representing the eternal sun. Secondly, on account of its red hue, suggesting the color of the solar disc at his rising and setting.

There were many obelisks throughout Egypt, but *An*, the city of the Sun (Heb., *On*; Greek, *Heliopolis*, the Beth-shemesh of the Bible), was the centre of sun worship and undoubtedly contained several obelisks, but one only now remains. It was erected, according to Petrie, by Usertesen I, a Pharaoh of the 12th dynasty (between 2758–2714 B.C.).

Of the numerous obelisks erected by Usertesen I, Thothmes III, Rameses II, only 48 are still in existence; 10 of which, including the one at Assouan, are prostrate, and 38 are found distributed in the following places: 9 in Egypt, 2 in Constantinople, 12 in Rome, 6 in Naples and other parts of Italy, 2 in France, 4 in England, 2 in Germany and 1 in United States. These monuments have always excited the cupidity and envy of Egypt's conquerors. Even as early as Augustus Cæsar the work of removing the beautiful monoliths as trophies had begun. According to Rollin (*Oeuvres Complètes de Rollin par M. Latronne*. Nouvelle ed., Vol. I, p. 14) that emperor removed two of those obelisks and made an unsuccessful attempt to remove a third.

The largest of the Egyptian obelisks was removed to Rome and now adorns the piazza of Saint John Lateran. It was brought from Thebes to Alexandria (about 330 A.D.) by Constantine the Great; thence to Rome by Constantius, who placed it in the Circus Maximus. Its present height is 108 feet and 7 inches. According to Cooper its weight is 455 tons. "On the fall of Rome the obelisk was thrown down and broken into three pieces, and it was suffered to remain unnoticed and indeed forgotten, save by a few antiquaries, amidst the ruins of the ancient circus till Pope Sixtus V caused it to be excavated, restored and re-erected in the present state (1588 A.D.)." Cooper, 'Egyptian Obelisks,' p. 35.

The obelisk in Central Park, New York, and the one on the Thames Embankment, London, are commonly known as "Cleopatra's needles." They were removed from Alexandria. The latter lay prostrate, half buried in sand, and was removed in 1877 to England. Our obelisk was brought over to this country at the expense of the late Mr. W. H. Vanderbilt in 1880. Both originally adorned the temple of *Ra* at Heliopolis and were erected by Thothmes III (1503–1449 B.C.). The hieroglyphic inscription on our obelisk bears the legends of two Pharaohs, Thothmes III and Rameses II. The central column on each side speaks of the achievements and triumphs of Thothmes III over the hereditary enemies of Egypt, the *Khetta* (the Hittites). The two lateral columns were engraved

about 300 years later by order of Rameses II. The legend treats of the same subject. He also fought the *Khetta*.

Commander Gorringe ('Egyptian Obelisks,' p. 115) gives a comparative table of the measurements and weight of these interesting monoliths. According to him the exact measurement of the obelisk in Central Park is 69 feet 6 inches in height, 7 feet 9 inches thick at the base and 448,000 pounds in weight. The London obelisk is 68 feet 5 inches in height, 7 feet 8 inches thick at the base and its weight is 418,000 pounds. The hieroglyphic inscriptions upon the south and west sides of our obelisk are deteriorated. But those on the east and north sides are in good condition. The inscription upon the pyramidions are almost obliterated.

OBER, ò'bér, Frederick Albion, American author: b. Beverly, Mass., 13 Feb. 1849; d. 1913. He was educated in the public schools and made a study of ornithology, traveling extensively in the pursuit of his studies in the West Indies (1876–80), Mexico, Spain, South America and northern Africa. He discovered 22 new species of birds. He has written 'Camps in the Caribbees' (1880); 'The Silver City' (1882); 'Travels in Mexico' (1883); 'Montezuma's Gold Mines' (1885); 'Porto Rico' (1892); 'Josephine, Empress of the French' (1895); 'Under the Cuban Flag' (1896); 'History of the West Indies' (1900); 'The Cacique's Treasure Cave' (1901); 'The Last of the Arrawaks' (1901); 'Tommy Foster's Adventures' (1902); 'Hernando Cortés, Conqueror of Mexico' (1905); 'Two Boys with Columbus' (1905); 'Pizarro and the Conquest of Peru' (1906); 'Heroes of American History' (12 vols., 1907); 'A Friend of King Philip' (1907); 'A Guide to the West Indies and Bermudas' (1908).

OBERAMMERGAU, ò'bér-àm"mèr-gow, Bavaria. See AMMERGAU; PASSION PLAY.

OBERHAUSEN, ò'bér-how-zèn, Germany, a town of Rhenish Prussia, in the Rhine valley, a few miles northeast of Duisburg, an important railway centre and seat of industry, having blast-furnaces, rolling-mills, forges, railway shops, extensive chemical works, porcelain, tinware, soap, wire-rope, glass factories and productive coal mines, etc. Pop. over 100,000.

OBERHOFFER, ò'bér-hôf'ér, Emil, German-American musician: b. near Munich in 1867. He received his early musical education from his father, a capable organist, and played the organ and violin extremely well at the age of 10. He studied the piano and musical composition under Carl Kistler in Munich and in Paris under Isidore Philip. He settled in the United States and became conductor of the Apollo Club at Saint Paul. In 1901 he directed the Philharmonic Club in Minneapolis and through his efforts the Minneapolis Symphony

Orchestra was organized and endowed. Of this Mr. Oberhoffer has been the conductor since its creation in 1903 and has raised it to a high standard of excellence that ranks it with the leading symphony orchestras of the United States. He also holds the chair of music in the University of Minnesota.

OBERHOLTZER, ô-bër-hol-ser, **Ellis Paxson**, American historian; son of Mrs. S. L. Oberholtzer (q.v.): b. Philadelphia, 1868. He was educated at the University of Pennsylvania (Ph.D. 1893), and at Berlin, Heidelberg and Paris; was on the editorial staff of the *Philadelphia Evening Telegraph* (1889-96); editor of *The Manufacturer* (1896-1900), literary and dramatic editor of the *Philadelphia Public Ledger* (1902-08). He has published 'The Referendum in America' (1893, 3d ed., 1908); 'Die Beziehung zwischen dem Staat und der Zeitungspressen' (1895); 'The New Man' (1897); 'Robert Morris, Patriot and Financier' (1903); 'Abraham Lincoln' (1904); 'The Literary History of Philadelphia' (1907); 'Jay Cooke, Financier of the Civil War,' (2 vols., 1907); 'Henry Clay' (1909); 'Philadelphia, a History of the City and its People' (4 vols., 1911), and edited 'American Crisis Biographies' (20 volumes).

OBERHOLTZER, Sara Louisa (**Vickers**), poet, author and philanthropist: b. Uwchlan, Chester County, Pa., 20 May 1841. She was educated at Friends Boarding School, Millersville Normal, and by private tutors. From 1890 Mrs. Oberholtzer devoted much of her time to the introduction of the school savings banks system into the public schools of the United States and Canada. Mrs. Oberholtzer was one of the speakers at the first meeting of the National Council of Women in Washington, D. C., 1890; at the World's Congress of Women in Chicago in 1893; at the Geneva (Switzerland) meeting in 1903, etc. Her bulletin on 'School Savings Banks,' written for the United States Bureau of Education, and printed by the government in 1914, has been widely distributed. Files of her *Thrift Tidings*, the quarterly she issued regularly for the public since 1907, will be found in most of our State and public libraries. Mrs. Oberholtzer is the acknowledged leader of the school savings banks movement now established in public schools in nearly every State in the Union and some schools in Canada. Her published books are 'Violet Lee,' 'Come for Arbutus,' 'Hope's Heart Bells,' 'Daisies of Verse,' 'Souvenirs of Occasions,' 'Dialogues,' 'Letters of Travel.' Her songs and hymns set to music by different composers are in hymnals and many of them in sheet form.

OBERLÄNDER, ô-bër-län'dër, **Adolf**, German caricaturist and artist: b. Regensburg, 1 Oct. 1845. In 1861 he entered the Munich Art Academy and later became a pupil of Pilotys, making brilliant progress under his instruction. He found that historical painting did not suit his particular talent, which he early revealed in a humorous cartoon published in 'Fliegende Blätter' (1863). He subsequently abandoned painting and devoted his entire time to humorous and satirical designs, which showed such striking virtuosity that he became the leading artist on the staff of 'Fliegende Blätter.' He is strong as a caricaturist and exquisitely deli-

cate as a draughtsman, and his use of satire and ridicule is good-natured and avoids the coarseness and brutality sometimes too apparent in the pages of the comic papers. The majority of his cartoons have been collected and published in the 'Oberländer Album' (Munich 1879-1901). Oberländer's subjects are taken from mythology, fairy lore, fables, animal life and the customs and habits of the German middle class. He is also a painter of some note; and pictures of his are in the galleries of Munich, Berlin, Dresden and other cities of Germany and in private collections.

OBERLIN, Jean Frédéric, ô-bër-län, Alsatian clergyman and philanthropist: b. Strassburg, 31 Aug. 1740; d. Ban-de-la-Roche, 1 June 1826. He was educated at Strassburg and in 1767 became pastor at Ban-de-la-Roche. There he spent the rest of his long life in labor for the material and spiritual improvement of his degraded parishioners. He practised medicine among them, founded a loan and savings bank, introduced cotton manufacture, helped the people build better roads, and brought in modern agricultural methods. His orphan asylums were the beginning of the many 'Oberlinvereine' for the protection of children. Beside all this he was a man of rare spirituality, being frequently styled "a saint of the Protestant church," and an excellent pastor, who preached each month three sermons in French and one in German. Oberlin College (q.v.), Ohio, was named in his honor. Consult the biographies by Butler (English, 1882); Luttheroth (French, 1826; a German version, 1890); and Hackenschmidt (German, 1902); and the life and works of Oberlin as edited by Hilpert and Stoeber (German, 1843).

OBERLIN, Ohio, village in Lorain County; on southern division of New York Central main railway system, east and west; Lorain and Ashland and the Lorain and West Virginia north and south; also the Cleveland, Columbus and Southwestern interurban electric railway, 33 miles west by south of Cleveland, on the State highway. It was settled in 1833 as a college town, and Oberlin College was founded the same year, and has grown to be one of the largest colleges in the United States. Oberlin was incorporated as a village in 1846 and has always been noted for its beautiful shady streets and fine homes, it has never had any saloons, it is an ideal residence town. It is in a fertile agricultural region and its industries are chiefly connected with farm products. Besides the college and its fine system of public schools, there is a business college and a kindergarten training school. Pop. 4,365, without the students numbering 2,000.

OBERLIN COLLEGE, at Oberlin, Ohio; coeducational, founded in 1833 under the name of the Oberlin Collegiate Institute. In 1850 the name was changed to Oberlin College, although from the beginning the work offered was of college grade. The preparatory was the first department opened, but within two years the collegiate department and the theological school were organized and in operation. It was the first college in the United States to adopt coeducation, and in 1835 admitted students "without respect to color." Oberlin College was a noted centre from which emanated strong anti-slavery sentiments, and in the vicinity was the

"Underground Railroad" (q.v.), so much used in slavery days by the Abolitionists (q.v.). In addition to the regular courses in the College of Arts and Sciences, there is a department of music and a graduate school of theology (undenominational). Courses are also given in physical education for both men and women. There is a summer school (offering work of college grade only). There is an average of 190 teachers and officers connected with the college, and a total student enrolment of 1,700. The attendance in the College of Arts and Sciences is limited to 1,000. The college has 5,280 living alumni. The library contains 232,600 bound volumes and 213,000 unbound volumes and pamphlets. The property of the college in 1922 was valued at \$6,444,867. The productive endowment amounts to \$3,808,643. For 1922-23 the total income of the institution was \$752,663. The faculty in the same year numbered 163, professors, assistants and instructors, while the student body numbered 1,798 of whom 1,054 were women.

OBERLIN THEOLOGY. This term is applied to a system of doctrine inculcated at Oberlin College by the teaching of the Rev. Charles Grandison Finney (1792-1875), who became professor of theology at Oberlin College in 1835 and president in 1851-66. Finney was an impressive teacher and preacher, who broke away from Calvinism and modified its tenets. Finney carried on revival services in New York, Philadelphia and Boston during the years 1828-57, and in London in 1849-50, and traveled through England and Scotland in 1858, expounding his theories and holding revivals.

The general type of doctrine is the "New School Calvinism," of which the characteristic thought is that all responsible character pertains to the will in its voluntary attitude and action, and that each moral agent determines for himself, in the exercise of his own freedom, whatever is morally praiseworthy or blameworthy in his character and life; that sin is a voluntary failure to meet obligation, and that nothing else is sin; and that righteousness, or holiness, is a voluntary conforming to obligation such as is always in the power of every moral agent. Neither sin nor holiness can be transmitted, inherited or imputed, in the sense of being reckoned to the account of one in whose will it has not originated. As punishment can be inflicted only as an expression of blameworthiness, no one can be liable to punishment for Adam's sin, because no one can be blameworthy for any sin but his own. It is just as impossible that one should be forgiven any sin but his own. The ethical philosophy of Finney and his associates makes the well-being, or blessedness of the sentient universe the *Summum bonum*, or ultimate good; and the voluntary regard for this good, which is called benevolence, the grand element of all virtue. It is a peculiarity of the Oberlin Theology to regard virtue (or righteousness) and sin as in their own nature antagonistic to one another, each being contradictory of the other, and necessarily exclusive of it. Virtue being benevolence, and sin the refusal to be benevolent, they cannot coexist in the same will.

The Oberlin doctrine of sanctification first promulgated at Oberlin by Mr. Finney and

others was based upon the prevalent idea that some sin still remains in the character and action of the converted man, coexisting with his obedience. The problem of sanctification is to eliminate this remnant of sin and make the obedience entire and permanent. On this view there would be two classes of Christians: the simple converted rendering a partial consecration and obedience; and the entirely sanctified whose consecration and obedience are entire. The theoretical and practical views of the Oberlin theology may be gathered from the following: *The Oberlin Evangelist* (24 vols., Oberlin 1839-62); *The Oberlin Quarterly Review* (4 vols., Oberlin 1845-49); Finney, Charles G., 'Systematic Theology' (2 vols., Oberlin, 1845-46); Fairchild, 'Moral Philosophy' (New York 1869); Foster, F. H., 'Genetic History of New England Theology' (Chicago 1907). The modern theological ideas of Oberlin College are set forth in King's 'Reconstruction in Theology' (1901); 'Theology and the Social Consciousness' (1902); 'The Seeming Unreality of Spiritual Life' (1908), and 'The Laws of Friendship: Human and Divine' (1909).

OBERON. Of all the works of the once fashionable, facile and wildly piquant senior member of the poetical galaxy which made the court of Karl August of Saxe-Weimar the literary centre of Germany, his romantic epic 'Oberon' (1780), is the only one universally read to-day in Germany. However, it is difficult for our age to appreciate Goethe's enthusiastic reception of the poem with the prophecy that "as long as poetry remains poetry, gold and crystal, 'Oberon' will be loved and admired as a masterpiece of poetic art."

It transplanted the manner and form of Ariosto's 'Orlando furioso,' though the stanzas are not so regularly built as the Italian. Based on Count de Tressan's (1778) narration of the *chanson de geste* of "Hun de Bordeaux" (12th century) and influenced by Shakespeare's 'Midsummernight's Dream' and Pope's version of Chaucer's 'The Marchantes Tale,' it mingles the fairy lore of Brittany and of 'The Arabian Nights' to celebrate exploits of the king of the fairies, Oberon (Old French Alberon, derived from the German Alberich—'Elf-prince'). For the slaying of Karl the Great's despicable son, Charlot, Hun duke of Guienne, is condemned to go to Babylon (or Bagdad) and demand four molars and a tuft of the beard of the kalif after kissing the latter's daughter and slaying her intended. This feat is accomplished through the friendship of Oberon and the magic power of his horn, a blast of which causes all wicked persons to dance, and of a certain ring, which had been abstracted from its owner, Titania, and to which all the spirit world was subject. Commanded to go to the Pope at Rome before consummating marriage with the kalif's daughter, Hun yields to temptation and the couple are thrown on a desert isle by Oberon, who had deserted his Titania with the vow never to return to her unless a human couple should be found who were absolutely faithful, since she had championed the faithless girl wife of an aged dotard. About the invented quarrel of Oberon and his queen, Titania, is centred the whole conception of Wieland's poem. Thrown by the instrumental-

ity of Titania into captivity in Tunis, Huon and Rezia withstand the first test of temptation and, reunited, return to Paris and reconcile Karl. C. M. von Weber based his opera 'Oberon' on Wieland's poem. Consult Köhler, Reinhold, 'Oberon' (Leipzig 1868); Wieland, C. M., 'Gesammelte Werke' (Franz Muncker, Vol. I, Stuttgart and Berlin); id., 'Werke' (Prussian Academy of Sciences, Erich Schmidt and others, 1909; English trans., William Sotheby, London 1805).

CARL E. EGGERT.

OBERON, OR THE ELF-KING'S OATH, romantic English opera in three acts by Carl Maria von Weber, libretto by James R. Planché, first represented at Covent Garden, London, 12 April 1826. The libretto is founded on Villeneuve's romance, 'Huon of Bordeaux' and Sotheby's translation of Wieland's poem, 'Oberon.' It was Weber's last work. The keynote of the whole is the picture of the mysteries of elf-land and the life of the spirits of air, earth and water, and through the hazy atmosphere of elves and spirits are discerned the outlines of two contrasting themes—Western chivalry and Oriental life.

Reiza's aria, 'Ocean thou Mighty Monster,' in the second act is frequently sung on the concert stage by dramatic sopranos. The charming overture beginning with a horn solo also has frequent independent performance. Mendelssohn, Gade, Schumann and Wagner have all drawn inspiration from this sublime and dreamy work.

The original autograph score is in the Royal Library, Petrograd, having been presented by Max von Weber to Alexander II in 1855.

The opera was translated into German by Theodor Hell and given in Leipzig in December 1826; in Vienna, 20 March 1827, and in Berlin, 2 July 1828. It was given in Paris in German without success in 1830 and in French with success in 1857. Oberon was first sung in New York, 9 Oct. 1829. It was given in Italian at Her Majesty's, London, 3 July 1860, with recitatives by Sir Julius Benedict, and this version was given in Philadelphia, 9 March 1870. 'Oberon' was revived in London, 7 Dec. 1878 and in New York at the Metropolitan Opera House, 28 Dec. 1918, in a new revision by Arthur Bodansky, who conducted the work. Consult Upton, *Standard Operas* (Chicago 1897), and *Musical America* (New York), 4 Jan. 1919.

OBESITY, a bodily state characterized by excessive collections of fatty tissues beneath the skin and within the tissues and organs of the body. In states of health the skin is provided with a layer of fat, which ordinarily increases and decreases as the state of health, amount of food or amount of exercise varies. Obesity becomes a disease when the increase of fatty tissue interferes with the functions of the body in its various parts. The condition may be inherited or acquired. The producing cause of most but by no means of all cases of obesity is the ingestion of more food than is required by the body. This is particularly true of the foods that are readily converted into fatty tissue—the carbohydrates (starches and sugars), fat and alcohol. In those who lead sedentary lives or are naturally indolent these substances, unless sparingly indulged in, cause the fatty

accumulations. There is also an interrelation between the sexual life and obesity, as seen at the time of puberty and at the menopause in many women, and by the deposition of fat in animals after castration. In ordinary cases of obesity the fat accumulates in the form of tiny droplets in the tissue-elements; in fatty degeneration the tissue elements are changed into fat. Fatty degeneration is found in the organs of those not afflicted with obesity, but in the late stages of the disease under consideration this very serious morbid change may come about.

The mechanisms by which fat is formed in the human body are by no means clearly understood. Physiological chemistry teaches that the synthesis of fat begins with glucose which on oxidation forms pyruvic acid. A hormone action, or enzyme, converts this into an acetaldehyde and carbon dioxide. Condensation then forms ketone acids which by the processes of condensation and polymerization builds up fatty acids. This is all under the control of the vegetative nervous system.

The underlying causes of these disturbances in metabolism are not always clear; while the excess of food consumed to the amount used in physical and mental labor is frequently accountable for the trouble, there are in many instances undiscovered factors. It is possible that deficiencies in the internal secretions from the thyroid and other glands may be in some way connected with the trouble. In myxoedema (q.v.) there is a disorderly deposit of fat through the body, and this disease is apparently due to atrophy of the thyroid gland. A number of glandular interactivities are related to different types of obesity. There is a marked hypopituitary type of obesity following pressure on the infundibulum with marked fatty developments particularly seen in young children or young adults. These are frequently seen after mild grades of hydrocephalus, which causing pressure on the pituitary, causes a partial atrophy of this gland and obesity becomes pronounced. It may persist unless another glandular activity compensates for it. The gonadal—i.e., genital—obesity of the eunuch and eunuchoid states have been mentioned. In later life pancreatic obesity is a frequent type. Hypothyroid states lead to the myxoedematous types. Hypoovarian types are also frequent.

Various plans of dietary treatment, most of which are unscientific, have received their originators' names. Among the first was that practised by William Banting (q.v.) on himself at the advice of Harvey. According to "Bantingism" the patient partakes of only 20 ounces of dry food in 24 hours and over half of this allowance is meat, while the fluid is reduced to 35 ounces. This plan, while it removes the food most likely to form fat, gives to the individual a large amount of nitrogenous matter difficult of digestion and assimilation, and deprives the body of heat-producing substances. Furthermore, the normal fat-supply of the brain is seriously reduced. A small proportion both of fat and carbohydrate must be combined with nitrogenous matter in order to ensure normal metabolism.

The Ebstein treatment recognizes the fact that fat is more easily disposed of in the body than starches and sugars, and that meat sub-

stances may be converted into fatty tissue when in excess. He, therefore, allows some fat, a moderate amount of meat, and almost entirely eliminates carbohydrates from the dietary. He also greatly restricts water and forbids alcohol. An ordinary diet-list made up according to this system is as follows: Breakfast, tea without sugar and dry buttered toast; dinner, meat soup or roasted fat meat with fat gravy, one or two fresh vegetables in moderation, salads and dried fruits; supper, an egg, moderate allowance of ham or fat meat and an ounce of thin well-buttered toast or dry bread.

The Oertel plan is much like the Ebstein, but the fats are not so freely given, and the carbohydrates not so sparingly. Great reliance is placed on graduated exercise to strengthen the heart's action, and thus the condition of the patient is improved and the fat oxidated. Patients under this system are made to climb carefully graded mountain paths for specified distances, which increase as the heart becomes stronger. Patients showing respiratory embarrassment are allowed only about 25 grams of fat, 90 grams of carbohydrate and 150 grams of proteid; those showing no respiratory embarrassment are allowed less proteid and more fat and carbohydrate.

The table prepared by Yeo contrasts these dietaries with the normal average:

	Albuminates grams	Fats grams	Carbo- hydrates grams
Normal average.....	130	84	404
Banting.....	170	10	80
Ebstein.....	100	85	50
Oertel.....	155-179	25-40	70-110

Schweinger's system is practically the same as Oertel's, differing in withholding all fluid until two hours after meals, allowing very little then. Germain See allowed a diet of proteid and fat, and required his patients to take large amounts of fluid. This plan seems to be well suited to individuals afflicted with gout and rheumatism. Others rely on rest and passive exercise, in the form of Swedish movements, etc., with a skimmed-milk dietary gradually replacing the ordinary food until the skimmed milk becomes the only article allowed. The patient is confined to a single room and for 10 days is allowed to walk but little. Careful watch must be kept that the patient's strength be not overtaxed. Many "eat and grow thin" diets have had their day; they chiefly are valuable in that they permit stomach satisfaction without offering too much food convertible into sugar. A properly selected opotherapy in the hands of a competent neurologist offers the best general treatment for excessive obesity.

OBERSTEIN, Germany, town of the principality of Birkenfeld, in the state of Oldenburg, 32 miles southwest of Kreuznach on the railroad to Münster-am-Stein, and on the Nahe River, a tributary of the Rhine at Bingen. With the adjacent township of Idar on the Idar Bach, it has been famous since the 16th century for the cutting and setting of agates and other precious stones, formerly found in abundance in the amygdaloidal melaphyre of the district in the Galgenberg or Steinkaulenberg overlooking Idar, and which is reputed to have furnished many of the Cinque Cento and Roman gems. By the middle of the 18th century the local deposits were almost exhausted,

but the important industry has been continued and increased by the importation of agates and other ornamental stones from all parts of the world, chiefly from Uruguay. Steam and electricity have largely supplanted the abundant water-power, operating the jewel-mills lining the Nahe River for over 30 miles from above Kreuznach to below Idar. Pop. 10,000.

OBI, ō'bē, a river in Siberia. See **OB**.

OBI, ō'bī, **OBE**, or **OBEAH**, a species of witchcraft practised among the native African and the West Indian negroes. The law of Jamaica, enacted in 1760, which prohibited under severe penalties the practice of obi, enumerates among the materials used for fetishes or spells, blood, feathers, parrots' beaks, dogs' teeth, alligators' teeth, broken bottles, grave dirt, rum and egg shells. Balls of earth or clay mixed with hair, rags or feathers and bound with twine, or in some cases blended with the upper section of the skulls of cats or stuck round with cats' teeth and claws, or with human or dogs' teeth and with glass beads were also used. In 1762 the influence of the obi men produced a formidable insurrection among the slaves in Jamaica and several of these sorcerers were hanged by the authorities. See **FETISH**; **WITCH-CRAFT**.

OBIDOS, Narrows of, Brazil, a contraction of the Amazon River, near the town of Obidos, 400 miles from the sea, where the river is compressed into a single course a mile wide and over 200 feet deep, through which the water rushes at the rate of four to five miles an hour. In the rainy season the flood-level near Obidos rises 35 feet above normal low river.

OBIT, ō'bīt or ōb'īt (Lat. *obitus*, decease), the service in the Church at the solemn interment of the dead; in the Roman Catholic Church, an annual religious service, founded for celebrating the memory of a deceased person and for the expense of which an endowment was left in many European countries. It is also called an annual or a year's memory. The institution of obits is said to be an ancient one in the Church. It is attributed to the practice in the primitive church of commemorating the martyrs, on the anniversary of their deaths. During the period of prosperity following the persecutions similar commemorations were extended to benefactors of the Church and to private individuals by friends and relatives. A like institution, called the commendation of benefactors, is observed in the English universities.

OBITER DICTUM, *in law*, an opinion by a judge on a legal point not in issue or forming no part of the grounds of the decision. *Obiter dicta*, while having no commanding authority, are nevertheless of some weight, particularly when uttered by eminent judges. Distinguishing between the law of a case and the dicta is sometimes very difficult, even for the jurist, but it is important, as the dicta have not the binding authority of law. The United States Supreme Court has held (16 How. 287) that to make an opinion a decision "there must have been an application of the judicial mind to the precise question necessary to be determined to fix the rights of the parties, . . . and, there-

fore, this court has never held itself bound by any part of an opinion which was not needful to the ascertainment of the question between the parties." Where appeals are frequent, it is usual for judges to fortify their decision by statements of merely collateral principles and hence obiter dicta have become common. Speaking generally, it may be said that dicta of eminent judges have approximately as much legal weight as would be attached to the utterances of eminent legal writers.

OBJECT, Philosophical. See **METAPHYSICS**.

OBJECT-GLASS, or OBJECTIVE. See **LENS; MICROSCOPE; TELESCOPE**.

OBJECT TEACHING, a model instruction in which the teacher makes use of objects, pictures, charts and other aids to concrete presentation of the ideas to be taught. The claim of the advocates of purely objective teaching for young pupils is that the development of the child naturally proceeds from concrete to concrete and that the recognition of this fact is essential for successful teaching of the young. Objective teaching is the means toward an end. Young children live a life of concrete things. They have all the concrete world about them to learn and nature has so fitted them that they readily learn everything that they can handle, feel, touch, taste or experiment with in any way with the senses. Childhood is the age of experiment and concrete investigation. Objective teaching takes advantage of this fact and it proceeds to teach children through the senses. They are made acquainted with more or less abstract ideas by sensual knowledge of objects. Forms, sizes, shapes, colors, numbers, qualities and attributes the child learns by actually coming into contact with them and making them a part of the daily experiences of his young life, in a way that seems no different to him from his general and natural manner of acquiring knowledge.

Object teaching is extended to the teaching of sciences, languages, mathematics and other subjects. In fact there is not a branch of education in which the principles of objective teaching have not made the presentation of the subject matter more concrete; hence, more comprehensible. The aim of object teaching is to train the senses, to increase the interest, to improve the power of judgment and to aid the expression of ideas through the development of languages. That these objects may be attained all matter must first be presented to the perception of the child in a concrete form and with such associations as at once to interest and thus cause a reaction in his mind. In other words, he is taught to think in his childish yet natural way. The teacher's business, therefore, in proper object teaching, is so to direct the activity of the child, through the use of natural objects about him, that he may learn not only to know them but also to compare them with other things and to reason about them.

Object teaching is as old as the teaching of the race. All primitive peoples have had some system of teaching generally suited to their social and racial advancement. Thus teaching and schools preceded the actual knowledge of letters. At the time of the discovery of America all the cultured races of the New World had extensive systems of indigenous education,

which for all, except the priestly class and the interpreters of the hieroglyphic manuscripts, was taught in a purely objective manner. In other words, the pupils learned to do by doing and their doing was done in order to learn. Here, therefore, in America, there existed object teaching in that early period of education when the means of recording the ideas of man were so imperfect that they had still to remain in the hands of professional interpreters and, hence, entered very little into the life of the nation as a whole. Under these conditions, objective teaching was the only possible method. In the lives of all the peoples of Europe and the other countries of the Old World there existed also a period in which writing, if used at all, was in such an undeveloped state that it was in the hands of professional interpreters, who were generally of the priestly class because the rituals of religion, of charms and medicines, which were a part of religion, were those which the tribe or nation valued most and so made most efforts to preserve. It was only after society became more complex and printed books came into use that object teaching was superseded by printed information, which often conveyed information in a manner far from the spirit of the old oral and objective method of imparting knowledge through experimental contact.

Long after the direct method of teaching had practically disappeared from the schools of Europe, it retained its hold where it had begun, that is in the teaching and imparting of knowledge of trades and, to a certain extent, of professions; pupils even being apprenticed to doctors, lawyers, druggists and other professional men to learn professions experimentally and practically. Even in Greek and Roman times efforts were made to make teaching more practical and many of the teachers taught almost altogether objectively. It was in the Middle Ages, when teaching fell almost altogether into the hands of the Church and practically only the priests and the members of the learned professions were educated, that object teaching was replaced by book teaching. Very early in this period there were gropings toward more concrete teaching. Among the first of the advocates of more objective presentation of knowledge was Comenius (1592-1670), who definitely formulated the principles of object teaching and organized and applied them to the work of the schoolroom. He proclaimed his gospel in words that sound very familiar to day; "Since the beginning of knowledge must be with the senses the beginning of teaching should be made by dealing with actual things. The object must be a real useful thing capable of making an impression on the senses." He wrote and published textbooks illustrated with pictures to be used in objective teaching; and he advocated the use of pictures of things to make concrete the words relating to them. Comenius had many imitators in his day and his idea of picture charts is still followed, especially in the teaching of modern languages, in several European countries. The natural successor of Comenius was Rousseau (1712-78). He made a great step in advance when he insisted in taking into consideration the experience of the child in his relation to the facts of life around him. He proclaimed his gospel: "Never substitute the sign for the thing itself save when it is impos-

sible to show the thing; for the sign absorbs the attention of the child and causes him to forget the thing represented." Pestalozzi (1746-1826) got his first ideas of object teaching from the writings of Rousseau. He attempted to put objective teaching on a scientific basis. Starting with the idea of "sense impression," he proclaimed that it was the "only true foundation of human instruction, being the only true foundation of human knowledge. All the rest results from this sense impression and the process of abstraction made through it."

In Germany the teachings of Pestalozzi took root; and his pupils carried his pedagogical ideas to their logical conclusion. They studied the child and his surroundings and proceeded to teach him in conformity with these surroundings and his own natural tendencies, and they evolved a practical working system and built up about it a complex structure of the theory of object teaching which is being added to daily in all parts of the civilized world. So thoroughly was this work done that early in the latter half of the 19th century object teaching had been introduced into most of the primary schools of Germany. As early as 1854 the importance of object teaching had been recognized by the kingdom of Prussia; and in 1872 the German government, through the Minister of Education, placed itself on record as favoring object teaching in the schools of Germany.

After the Franco-Prussian War object teaching began to come into its own in France, and it was gradually but rapidly introduced into all the primary schools of the republic. Many expounders and defenders of the system sprang up and France came rapidly to the fore as the prophet of object teaching and the use of the natural method in the imparting of foreign languages.

As early as 1809 Joseph Neef established various Pestalozzian schools in the United States; in Philadelphia, 1809; Village Green, Pa., 1813; Louisville, 1816; New Harmony, Ind., 1825; Bar Harbor, Mass., 1839; Westfield, Mass., 1844. Westfield introduced object teaching and claimed that all branches of study could be taught objectively. In 1860 Edward A. Sheldon (q.v.) became acquainted with a collection of pictures, models and appliances made use of by the English Home and Colonial School Society. These he found in the National Museum (of Education) in Toronto, Canada. On his return to Oswego, N. Y., he introduced object teaching into the public schools. In 1863 Sheldon read a paper on object teaching before the National Teachers' Association held in Chicago, which so interested that body that a committee was appointed to inquire into the subject and to report to the association. Two years later the committee reported favorably; advocating the establishment of object teaching in the elementary schools of the United States. Prof. H. H. Straight gave to the movement system and organization and applied object teaching to science, and W. T. Harris followed along the same lines and introduced object teaching into the schools of Saint Louis. His influence carried the movement to most of the schools of the United States. Out of these and other efforts for the establishment of object teaching in primary schools grew the wider embracing "nature study," which has now become general in all modern, up-to-date schools, not alone in the

United States, but in Canada, the Latin-American countries and Europe. (See KINDERGARTEN; NATURE STUDY; PEDAGOGY; PESTALOZZI; SHELDON, E. A.). Consult Barnard, 'Pestalozzi and his Educational System'; 'Object Teaching'; Calkins, 'Primary Object Lessons'; 'Manual of Object Teaching'; Ricks, 'Object Lessons'; Salmon, D., 'Longman's Object Lessons'; Sheldon, E. A., 'Manual of Elementary Instruction.'

J. H. CORNYN,

Editorial Staff of The Americana.

OBLATES. See ORDERS, RELIGIOUS.

OBLIGATION, the binding power of a contract, promise, law or the like; also, a written instrument creating an obligation, as a deed or bond. This term dates back to Roman law (*obligatio*). In English law it is restricted in meaning to the duty of the party who is bound to perform, whereas in Roman law it signified also the right of the party who could enforce performance. A party who is bound to perform an obligation is to-day known as an obligor or debtor, while the party who can enforce performance is known as an obligee or creditor. The Roman law, like the English law, to-day, held that obligations may arise *ex contractu* (from contract) or *ex delicto* (from tort). The Romans further divided obligations into those quasi *ex contractu* and those quasi *ex delicto*. These classifications are retained by many codes in Europe to-day. An example of an obligation quasi *ex contractu* is one which arises in case of an unauthorized agency or when one party is enriched unjustly at the expense of another. An example of an obligation quasi *ex delicto* is one which arises when a party is held to be liable for a tort which he did not commit or authorize.

Obligations are extinguished by performance, by the creditor accepting something in lieu of performance, by confusion (which arises when the debtor becomes heir to the creditor, or the reverse), by novation, by set-off, by release, by limitation, by death of one of the parties (usually only in obligations *ex delicto*), by bankruptcy, etc.

OBLÓMOF, by Iván Alexksándrovitch Goncharóf, is regarded as one of the masterpieces of Russian literature. The character of its hero so completely stands for a type common in the old days of serfdom, that it has given rise to a term, *oblómovshchina* or *oblomovism*, signifying something more than mere indolence, though indolence is its root. It is outlined in the very first glimpse that we get of Oblómov as he lingers in bed while all the rest of the world is busy with pleasures or affairs: "He was a pleasant-looking man of two or three and 20, of medium stature, with dark gray eyes; but his face lacked any definite idea or concentration of purpose. A thought would wander like a free bird over his features, flutter in his eyes, light on his parted lips, hide itself in the furrows of his brow; then entirely vanish away, and over his whole countenance would spread the shadeless light of unconcern. This indifference extended even to the attitudes of his body, even to the fold of his dressing-gown. Occasionally his eyes would darken with a shade of weariness or disgust, but neither weariness nor disgust could for an instant dispel from his face the indolence which was the

dominant and habitual expression not only of his body but also of his very soul. Oblómov was good, honorable, tender and generous. Hence he had many friends and they tried to cure him of the terrible disease that possessed him. They tried to get him to ride or to walk or to go with them into the society which he ought to adorn; but energy was lacking even to dress. Scholtz, his boyhood friend, made him promise to join him in a trip abroad. Oblómov went so far as to procure his passport, order an expensive coat and buy a cap. But days passed and he kept postponing it. For a little there was some improvement: he met Scholtz's pretty friend Olga and her aunt. It would have been an admirable match. Olga loved him and did her best to stir him into energetic action; but he let her go and when Stoltz returned from Europe he found their engagement broken and married Olga himself. He took hold of Oblómov's neglected estate Oblómovka and brought it back to a paying basis; but Oblómov let himself fall into the clutches of a designing widow, his landlady, and married her. Then he had apoplectic strokes and died, still loved and regretted. Scholtz and Olga took his little son and brought him up with their own children. Oblómov is, therefore, the story of a pathetic broken career depicted relentlessly, with wonderful skill. A charming and quite original feature of it is the use of Oblómov's dreams to relate the story of his early life and abortive education. These day dreams are a sort of psychoanalysis, explaining how he came to be the man he was and also what sort of a man he was. Serfdom, which removed from the landed aristocracy the necessity of even such a simple task as putting on its own boots, was responsible for many cases of oblomovism, a term, by the way, applied by Oblómov to himself, recognizing it as a hopeless disease. The first draught of the story appeared under the title 'Son Oblómov' ('Oblómov's Dream') in 1848-49 in the *Illustrated Album*. In its complete form, in four parts, it has enjoyed popularity ever since. Extended passages from it translated by N. H. Dole first appeared in English in 'The Library of the World's Best Literature' in 1897; in 1915 it was published complete in the version of C. J. Hogarth.

NATHAN HASKELL DOLE.

OBOE, ō'bō-ě, an Italian musical wind instrument resembling a clarinet in shape, and sounded through a double reed. It consists of three joints besides the mouthpiece, and like many other wind instruments produces a series of overtones.

OBOLUS, a Greek coin of silver or copper, the sixth part of a drachm, about 21 cents in value.

OBONGO, ō-bŏng'gō, or **ABONGO**, a tribe of pigmies who live in different parts of French Kongo in West Africa. See **PIGMIES**.

OBRADOVICH, ō-bră'dō-vich, **Dositéy**, Serbian author: b. Csákovar, Hungary, in 1739; d. Belgrade, 7 April 1811. At the age of 15 he entered the monastery of Hoppovo in south Hungary, but he soon found the life of a monk distasteful and abandoned it for a life of travel with a view to acquiring a knowledge of classical and modern languages and literatures. He studied philosophy and natural theology in

the universities of Leipzig and Halle and brought out his first book in Leipzig in 1783. After visiting France and England he returned to Leipzig and then spent several years in Vienna and Trieste. As an ardent Serbian patriot he proclaimed the principle that books ought to be written for the people in the language that they understand and speak. He therefore wrote his first book, which was called 'The Life and Adventures of Demeter-Obradovich — a monk named Dositéy' (Leipzig 1783), partly autobiographic and partly fantastic, in the Serbian language. It immediately made a great impression and was continued in a work called 'Home Letters' (1785). This was followed by a translation into Serbian of 'Æsop's Fables' (Leipzig 1789), which was even more warmly welcomed. These books created a reading public and mark the beginning of the modern period of Serbian literature. Obradovich, or "Dositéy," as he is popularly called, was so highly appreciated as patriot and author that in 1807 Karageorge invited him to Serbia to be a senator and minister of public education, in which capacity he established in Belgrade the first Serbian college (Velika Shkola), which ultimately became the University of Belgrade. Obradovich also wrote 'Wise Counsel' (1784) and a work on morals (1793), both having Serbian titles. His complete works were published by Vozarovich (10 vols., Belgrade 1833-45). Consult Serviċ, 'Dositheus Obradović' (Neusatz 1889), and Léger, 'Serbes, Croates et Bulgares' (Paris 1913).

OBREGON, ō'brā-gŏn', **Alvaro**, Mexican general: b. in the district of Alamos, Sonora, in 1880. He came of a wealthy family, owning large tracts of land in Sonora, and after receiving a good education devoted himself to scientific farming and stock-raising on his inherited estates. He also invented several pieces of agricultural machinery. Yet, although a man of wealth, he early became an advocate of reform laws that would give the common people of Mexico a share in the land; showed much sympathy for the peons and Indians and became interested in the problem of their education. His career as a military leader began in 1912 when he recruited a force of 400 Indians, with which, as lieutenant-colonel, he entered into the service of Madero to put down the revolt of Pascual Orozco (1881-1915). His early history has been well told in a small sketch by Allene Tupper Wilkes in *Harper's Weekly* (1914) as follows: "When in the early months of Madero's term of office Pascual Orozco and his Reds became a terror in the state of Chihuahua, Obregon collected a band of 400 Maya Indians and volunteered to help drive the Reds from the country. Obregon and his Indians were put under the command of Huerta, who had been sent by Madero to quell the Orozco rebellion. In the battle of Ojito Obregon's command gained for themselves the title of "Invincibles." His fame spread to Sonora and so many of his fellow-citizens came to join him in Sonora that he rode home again at the head of a revolutionary army of 4,000 men.

"He was made colonel in the Sonora State Militia and held this rank when Felix Diaz started the military uprising in Mexico City, which resulted in the death of Madero. Obre-

gon again gathered his band of Indians, between 400 and 500 of them, and offered his services to Governor Pascaras of Sonora. He was ordered to Nogales, where he routed the garrison that, under the command of Colonel Costerlisky and Colonel Rangel, had gone over to Huerta. Soon after this he fought a successful battle at Cananea. Governor Carranza of Coahuila had by this time been declared first chief of the Constitutional army, and he now raised Obregon to general of division with the Army of the West, a rank equal to that held by Villa, who commanded the Central army. Then followed Obregon's unpronounceable victories, an unbroken record until he laid siege to Mazatlan." His successful attack of Sinaloa and Culiacán and the capture of Guadalajara, 9 July, opened the way for his advance on Mexico City; and he led the Constitutional army into Mexico City on 15 Aug. 1914. He attacked and defeated Zapata in his stronghold in Puebla, driving him into the state of Morelos. The battle of Puebla (January 1915) was the death-knell of Zapata's hopes. He re-occupied Mexico City in January 1915, but evacuated it on 10 March. In April he undertook a campaign against Villa for the control of central Mexico and shattered Villa's hopes completely at the battle of Celaya (15-19 April 1915). He defeated Villa in the battle of León (31 May-4 June 1915), where he was severely wounded. He lost an arm in battle. In 1920 he was elected President of Mexico.

OBRENOVITCH, ô-brên'ô-vich, Serbian princely family, rivals of the Karageorgevitches, who hold the throne since the assassination of Alexander I (q.v.). See **SERBIA**.

O'BRIEN, Cornelius, Roman Catholic archbishop: b. New Glasgow, Prince Edward Island, 4 May 1843; d. March 1906. He was educated at Saint Dunstan's College, Charlottetown, Prince Edward Island, and at the Propaganda College in Rome, and was for some time professor in Saint Dunstan's College and rector of Saint Dunstan's Cathedral. In 1882 he was consecrated archbishop of Halifax. Among his published works are 'After Weary Years,' a novel; 'Aminta,' a book of dramatic verse.

O'BRIEN, Fitz-James, Irish-American short-story writer, journalist and poet: b. Limerick, Ireland, 1828; d. Cumberland, Md., 6 April 1862. After study at Dublin University he went to London, where he soon got rid of a fortune, became a journalist and in 1852 came to the United States. He wrote for Brougham's *Lantern* and became also one of the valued contributors to *Harper's Monthly* and *Weekly*. His imaginative short stories, 'The Diamond Lens' and 'The Wonder-mith,' first printed in the *Atlantic*, were of a series notable for originality and effective ingenuity. He was also one of the most popular dramatists of his day. His 'A Gentleman from Ireland' kept the boards for a generation. In 1861 he entered the 7th New York regiment and was sent to the defenses of Washington. Later he was appointed to the staff of Gen. F. W. Lander, won praise from McClellan, and on 26 Feb. 1862 received in a skirmish the wound from which he died. He was a true, if a minor, poet, and wrote some very striking prose fiction. William Winter, poet and critic, collected his most worthy work (1881). Consult Winter,

William, 'Brown Heath and Blue Bells' (New York 1895), and also the introduction to Winter's collection, O'Brien's poems and stories mentioned above.

O'BRIEN, Jeremiah, American patriot: b. Scarborough, Me., 1744; d. Machias, Me., 5 Oct. 1818. He was in the lumber business at Machias at the outbreak of the Revolution. Shortly after Lexington, the British cruiser *Margaretta* appeared in Machias harbor, seeking lumber for the defenses at Boston. Sixty volunteers soon set out in a lumber-sloop, under the leadership of O'Brien, to capture the British vessel. In the following hand-to-hand encounter, the first sea-fight of the war, they were completely victorious. The sloop took on board the *Margaretta's* armament, and, renamed the *Machias Liberty*, coasted about, with O'Brien as captain, for 18 months, and took several prizes. O'Brien was later in command of the privateer *Hannibal*, was captured and was for some months imprisoned in the Mill Prison, England, but made his escape. On his return to the United States he was appointed collector of the port of Machias.

O'BRIEN, Lucius Richard, Canadian painter: b. Shanty Bay, Ontario, 15 Aug. 1832. d. 1899. He began life as an architect and civil engineer and spent much time sketching in the open air as an amateur. In 1872 he joined the Ontario Society of Artists; in 1880 was appointed president of the Royal Canadian Academy of Art, and in 1895 president of the newly-formed Provincial Guild of Sculpture. He is pre-eminently a portrayer of Canadian scenery and the two pictures of Quebec which he painted by order of Queen Victoria, his views of the Rocky Mountains and Seikirk Range and his 'Sunrise on the Saguenay' (Art Gallery, Ottawa) are the most characteristic of his works.

O'BRIEN, Richard Barry, Irish historical writer and biographer: b. Kilrush, County Clare, 1847; d. London, 17 March 1918. He was educated at the Catholic University, Dublin, and in his student days advocated an Irish republic. He went to London in 1869 to complete his legal studies, and while there he gathered experience which, according to his own confession, softened his sentiments toward England, though he remained an uncompromising Nationalist throughout his life. As personal friend and adviser to Parnell and John Redmond he for many years exerted considerable influence in Irish politics. He possessed a profound knowledge of Irish history and parliamentary procedure, combined with sound judgment and literary ability. At the outbreak of the European War he strongly supported John Redmond's declaration in Parliament that it was the duty of Ireland to take her stand with England in defense of liberty. Three of his sons immediately volunteered and entered the army. At the time of his death O'Brien was a director of the National Bank. Among his numerous writings the best known are the biographies of Parnell (1898), Lord Russell of Killowen, Lord Chief Justice of England (1901), and John Bright (1910).

O'BRIEN, William, Irish journalist: b. 2 Oct. 1852. He was for several years a contributor to various journals, and in 1875 he joined the staff of the *Freeman's Journal*, and

in 1880 founded *United Ireland*. He was prosecuted nine different times for political offenses and spent over two years in prison. He entered Parliament as a Nationalist in 1883, retired in 1895 and was re-elected in 1900 and 1909. In 1898 he started a new agrarian movement, called the United Irish League, with the *Irish People* as its organ. Among his works are 'When We Were Boys' (1890); 'Irish Ideas' (1894); 'A Queen of Men' (1897); 'Recollections' (1906), and 'An Olive Branch' (1910).

O'BRIEN, William Smith, Irish politician: b. Dromeland, County Clare, Ireland, 17 Oct. 1803; d. Bangor, North Wales, 17 June 1864. He was educated at Harrow and Cambridge, in 1826 entered the House of Commons as member for Ennis and in 1835 was returned for Limerick and retained his seat for 13 years. He was for some time an ardent supporter of O'Connell; but on O'Brien becoming the head of the Young Ireland party the friendship was broken. He was active in the insurrection of 1848 and was arrested, tried for high treason and sentenced to imprisonment for life at Tasmania. He was pardoned in 1856. He was the author of 'The Principles of Government' (1855). Consult Sullivan, A. M., 'New Ireland' (London 1877); Duffy, 'Young Ireland' (2d ed., 1883).

OBSCENITY, *in law*, that which offends modesty, delicacy or chastity. It is a misdemeanor by English law to give an obscene exhibition or to publish obscene matter, as is also the use of obscene language in public places. By the Federal law of the United States it is an offense to send obscene matter through the mails, and it is also a statutory offense in England. It is held usually that a publication is obscene if it is likely to corrupt those whose minds are open to immoral influences and into whose hands a publication of this sort may fall. It is no defense that it was done to accomplish a good purpose or that it is an accurate report of a judicial proceeding. There has been much criticism of the law in this direction in recent years, to the effect that many works of medical or sociological importance have been kept from the market owing to the legal contention that they violate the laws of obscenity.

OBSERVANTINES. See FRANCISCANS.

OBSERVATORY. An observatory may be defined as a station or institution for the observation of phenomena of nature. The principal kinds of observatories are astronomical, meteorological, magnetic and seismological; dealing respectively with observations of celestial objects, of the weather, of the earth's magnetism and of earthquakes. In some cases all of these kinds of observations are made at the same astronomical observatory. The term astrophysical observatory is applied to an institution which specializes in spectroscopic work, solar physics or other applications of physics to astronomy. Astronomical observatories are of very ancient origin, and they have developed in complexity as new instruments and improved methods of research have gradually been discovered.

Location and Equipment.—The proper location of an astronomical observatory is of great importance, as is now better recognized

than formerly. The site should have a wide horizon and be free from the disturbances associated with life in large communities, such as shocks and vibrations due to traffic of railways and electric lines, dust and smoke. The modern illumination of cities produces a glare of light at night, even at distances of several miles, which greatly hinders visual observations and practically forbids celestial photography. Accordingly the tendency has been in recent years to remove existing observatories to stations farther from large cities, while new institutions are located with much more care than formerly. Observatories chiefly for research, if not attached to a university, are placed in favored mild and dry climates where clear skies are the rule, and where there is only a small diurnal range of temperature. An altitude of a few thousand feet is desirable, to avoid the dust-laden and denser lower strata of the atmosphere and to secure good transparency. The heating of the slopes of a mountain in such a region by the sun may injure the steadiness of the air for observation of the sun, and produce what is called poor "seeing" during the daytime, while at night the seeing may be very steady. Some lofty stations, like Pike's Peak, Colo. (14,000 feet above the sea), seem to be continually subject to conflicting currents of the upper air, producing unsteady images, fatal to good astronomical work.

In view of the heavy piers which must be installed for supporting the instrument and which constitute a large item of expense of construction, the site should be suitable in respect to drainage and rock formation. It is undesirable to set piers on ledges, as they may outcrop elsewhere and convey vibrations from a long distance. Probably a deep gravel furnishes as good a foundation as any.

Where possible a large observatory is placed with its main axis east and west, as the rooms for meridian instruments must have their openings of roof north and south; but these instruments may be placed in wings, or, better, in small detached buildings, which are planned so that they will quickly assume the temperature of the outer air. If there are large domes, they are placed at the ends of the building, to avoid mutual obstruction; but they, too, are often detached structures. Aside from domes and observing rooms, a modern observatory generally includes the following rooms: Offices for the staff of observers and computers and for administration; a library; rooms for lectures, for the reception of visitors, for measuring machines; laboratories (for instance, physical, spectroscopic, photographic, photometric); dark rooms for developing and copying photographs, storerooms for preserving them; clock rooms; cabinets for small apparatus; a machine shop and a carpenter shop.

Observatories for instruction of college students may be very simple, with a dome for the largest telescope, and one or two wings for meridian instruments. A flat roof or balcony from which celestial objects may be pointed out to students is a convenience. To avoid the great expense of large turning domes, horizontal telescopes have come into use somewhat in recent years. They are often set up for temporary stations, as for observing solar eclipses. Here an instrument called a coelostat or siderostat carries one or more large flat mir-

OBSERVATORIES

1 Main Building, United States Naval Observatory 2 Nine-inch Meridian Circle, United States Naval Observatory
3 Twenty-six-inch Great Equatorial, United States Naval Observatory

rors and by a driving mechanism continually throws the light into a long horizontal tube, which may be of wood, or even paper, containing either a lens at the near end or a concave mirror at the far end for forming the image of the celestial object. The image may be brought into a laboratory or dark room for observation or photography, if desired. This construction has serious limitations, however, and one of its defects is the difficulty of avoiding unequal temperatures in the cross-section of the beam within the tube, which seriously impair the definition. The largest instrument of this sort thus far constructed is the Snow telescope of the Yerkes Observatory, afterward transferred to the Solar Observatory. The flat mirror of the coelostat had a diameter of 30 inches and the second flat mirror of 24 inches, the concave mirror at the far end having a diameter of 24 inches and a focal length of 60 feet.

An improvement over this construction is the vertical telescope. The same two flat mirrors are required, but the beam is reflected down vertically instead of horizontally. This avoids the difficulty in the cross-section of the tube, as a progressive change of temperature and density of the air along the direction of the beam should not injure the definition. If an objective is used, it is placed just below the level of the coelostat; if a concave mirror forms the image, it would be placed far below, at a distance something more than its focal length, e.g., in a well, with the apparatus of the eyend housed at the surface of the ground, or a little below it. Horizontal and vertical telescopes commonly are of relatively extreme focal length. At the Mount Wilson Observatory two of these vertical instruments, called tower telescopes, have been erected for solar work, one of 75 feet, the other of 150 feet focal length. The small dome covering the coelostat and objective is supported on a skeleton steel tower, the members protected by steel sheaths from vibration due to wind, and the powerful spectroscopes into which the light is brought are set down in pits beneath the surface of the ground. A vertical reflector, of the well type, has not yet been constructed. These designs obviously depart widely from the conventional type of observatory.

For detailed description of the Snow horizontal telescope, consult *Astrophysical Journal*, 21, 157-167, 1905; for tower telescopes, *ibid.*, 25, 68-74, 1907; 27, 204-212, 1908; articles by G. E. Hale.

The type of telescope known as the *Coudé*, invented by M. Loewy of the Paris Observatory in 1871, and put into operation 12 years later, is now used at a few European observatories. It has manifest advantages. The observer can remain in a warm room in a comfortable position before the fixed eye-piece, and looking down the direction of the polar axis. Flat mirrors throw the image from the object-glass up the oblique tube to the eye-piece. A special construction is required for the building; the dome is unnecessary, but the large movable cylinder for protecting the instrument cannot be much less expensive than a dome of corresponding size.

The Field of Research and Study.—An astronomical observatory is provided with instruments for the precise study of celestial phenomena. This study may cover a wide

field of research, including some or all of the following: (a) The measurement of the accurate positions of sun, moon, planets, comets, stars, nebulae. From the combination of successive positions, the motion in the sky of these objects may be deduced. The knowledge of such positions is necessary for the navigator, the geographer, the surveyor and is the basis for practical astronomy. (b) The determination of the exact time by observing the passage of stars across the meridian. Modern life requires the constant knowledge of the time. It is obtained from observations of the stars, and then widely distributed to railway stations, jewelers and public places by telegraph and by wireless. (c) Conversely to (a) and (b) the exact position of the station itself is determined by observation of the stars with special instruments. This yields fundamental data for geography and geodesy. (d) The measurement of the brightness, or intensity of the radiation, of all celestial objects, which is found to be changeable in a great number of cases. For instance, the intensity of the sun's radiation lately has been found to vary, which is of the greatest practical importance for the inhabitants of the earth. (e) The visual and photographic study of the surface markings, rotations and changes of the sun, moon and planets. (f) The photography of the heavens as a whole for investigating the structure of the universe; and of comets and nebulae in particular, for recording the appearance and changes, which are very marked for comets, but not for nebulae. (g) The investigation of the physical and chemical constitution of celestial bodies, for giving a basis for a philosophy of the universe and for studying its evolution. Such observations are the special field of astrophysics, and an institution devoted chiefly to such work is called an astrophysical observatory. The instruments of an observatory differ according to the purposes named above for which they are to be used.

For precise fundamental positions of celestial objects, (a) the meridian circle is the chief instrument. This is a telescope of from 6 to 10 feet long, turning on a horizontal axis pointing exactly east and west, and very rigidly supported by heavy piers. The motion of the instrument itself is, therefore, solely in the meridian, from the north point, through the zenith to the south point of the horizon. Attached to the sides of the instrument are large graduated circles representing the highest skill of the instrument-maker. The divisions are generally made on an inlaid strip of silver, usually 12 to each degree, or 4,320 for the whole circle. They are read by from two to six microscopes rigidly connected to the large piers supporting the axis. When the star passes across the field of the telescope the observer sets a movable spider thread so that the star shall run exactly along the thread; then he notes the exact instant when the star passes each of a set of vertical spider-threads, pressing a key which makes a record of each within a few hundredths of a second on a chronograph connected with a very accurate clock keeping sidereal time. Then the microscopes are very carefully read and the star's position is obtained for that passage or transit: the circle giving the position in the north and south direction, and the record of the time giving that in the east

and west direction. Similar observations of standard stars, and of fixed points like the nadir (by sighting the instrument at a surface of mercury under the floor and making the horizontal thread and its image coincide) yield the accurate position of the star, after numerous instrumental corrections have been determined and applied. The star's distance in degrees, minutes and seconds north or south of the celestial equator is its declination; its distance in hours, minutes and seconds east of the vernal equinoctial point of the sky is its right ascension.

It is thus apparent that clocks of the best possible construction are essential in an observatory. They are generally kept in special vaults protected from all jar of traffic and from changes of temperature or moisture, and sometimes from changes of atmospheric pressure by being in a chamber exhausted of air. Chronometers, being portable, are also used in observatories for some observations, and generally at astronomical stations in the field.

For the determination of the time, (b) above, a smaller and less complicated instrument, known as the transit, is employed. No finely graduated circle is necessary and the telescope is seldom over 30 inches long, with a lens of two or three inches aperture. For eliminating instrumental constants, the observer raises the axis out of its V-shaped supports, and reverses its direction, changing the east and west sides, after half of his list of stars has been observed. The essential feature of having the telescope exactly in the plane of the meridian, and of observing and electrically recording the instant at which a time star passes each of the set of vertical spider threads, is the same as in case of the meridian circle.

For finding the accurate positions of faint objects instruments set in the meridian have too many limitations, and telescopes are used which may be pointed to any part of the sky. These are now almost universally mounted equatorially, which means that one axis points toward the celestial pole, thus allowing a free east and west motion, while the other axis is perpendicular to the first, allowing a free motion north and south. A driving mechanism is provided which turns the polar axis toward the west one complete turn in a sidereal day. This makes the telescope follow any star quite closely as it moves across the sky from rising to setting; otherwise the stars would quickly drift out from the field of view. Very large telescopes can be mounted in this way. The positions observed with such an instrument are relative: that is, the distance and direction of the unknown object from a known star in the same field of view is measured by a system of fixed and mobile spider threads operated by a very accurate screw with graduated head. This attachment is called a filar micrometer. If no known star is in the field of view, but one is seen to the east or west nearby, the telescope may be clamped and the two objects be allowed to drift in succession through the field, the distance in declination between them being measured by the threads, and in right ascension by the interval of time elapsing between the passage of the two objects across the system of north-and-south threads.

Equatorial telescopes are of two principal

kinds: refractors, in which the image is formed by an object-glass; and reflectors, in which a concave mirror, generally of glass, silvered, collects the light and brings it to a focus. See TELESCOPE.

The arrangement of the dome is different for the two types of instrument. The observer does his work at the lower end of the refractor, and for large instruments it is a great convenience to have a rising floor or platform so that he can be always at a convenient height for reaching the eye-end. As the observer must be at the upper end of the tube of a reflector, it is necessary with the largest instruments to hang an observing cage on the inner surface of the dome, opposite the shutter, and to move this about by electric motors to suit the necessary altitude of a given object. Large equatorial telescopes require domes which may be turned on circular tracks toward any direction; cylinders may be used, but in America hemispherical domes are employed almost without exception. A shutter several feet wide covers the opening, extending from the base to the top of the dome.

From the observation of the altitudes (c) at transit of stars whose declinations are exactly known, the latitude of the observatory may be precisely determined, with employment of the meridian circle as above, or of a smaller, portable transit instrument provided with extremely sensitive levels and called the zenith telescope. The practical use of this instrument was developed by Capt. Andrew Talcott of the United States engineers shortly before 1850. It is used for the survey of all boundaries which run along a parallel of latitude and for the exact location of all stations used in the triangulation of a national survey. The same room or detached building can be used for the zenith telescope as for the transit instrument for time.

It may seem unnecessary to determine the latitude of a fixed observatory but once, when it is definitely located. It was by the repetition and increase in precision of such measurements, however, that the discovery was made in 1885-88 that the latitude of a place is not constant but variable. This is proved to be due to the fact that the earth's axis varies within the earth, so that at the pole it would trace an irregular curve in a period of about 428 days, having, in years showing the greatest range, a maximum diameter of about 60 feet. This affects the latitude of every station on earth. Another instrument used in a few observatories for this purpose is the transit set in the prime vertical or plane passing through the zenith and east and west points of the horizon. For this instrument the opening of the roof must lie east and west, but otherwise the installation is the same as for the transit.

The measurement of the brightness (d) of celestial objects, or celestial photometry, has been greatly developed in recent years. Useful observations of the brightness of variable stars can be made by the eye, without instruments, or with a field glass or small telescope. Numerous varieties of photometers are used, some depending upon polarizing the light by nicol prisms and equalizing the images of the variable and comparison star. At Harvard College Observatory, E. C. Pickering devised the "mc-

OBSERVATORIES

1 Yerkes Observatory, Williams Bay, Wis.

2 Twenty-four inch Bruce telescope, Harvard College Observatory

ridian photometer^b of this type, in which the north star was kept in the field for comparison with each star measured. This instrument was arranged so that the observer could remain in a small room without a dome and observe the stars as they crossed the meridian. The newest photometers are intended to be independent of the eye, depending on the principle (a) that the electric resistance of selenium changes when light falls upon it, or (b) that a so-called photo-electric current is developed when light falls upon specially prepared surfaces of sodium, potassium, etc., inside of evacuated glass cells. These photometers are commonly attached to refracting telescopes with apertures of 10 inches or more.

Both refracting and reflecting telescopes are now employed successfully in photographic photometry, with ordinary and with special plates sensitized to match the human eye.

The measurement of the intensity of the radiations received from the nearest star, our sun, is a special problem of astrophysics closely related to meteorology. The instruments employed are the actinometers and the bolometers, the latter invented by S. P. Langley and successfully used by him at the Astrophysical Observatory of the Smithsonian Institution at Washington, and further developed by his successor, C. G. Abbot. A horizontal telescope was used considerably. Special apparatus was also designed and set up on Mount Wilson, Cal., for the problem of measuring the fundamental "solar constant," or amount of heat-energy received per square metre per second at the earth from the sun. Observations by Abbot at widely separated stations have established the fact that the radiation received from the sun varies by as much as 7 per cent.

With an exceedingly sensitive radiometer it was possible for E. F. Nichols to detect and roughly measure the heat-radiation from two of the brightest stars in 1900 at Yerkes Observatory. Further advances were made when W. W. Coblentz of the Bureau of Standards at Washington revived the use of the thermopile and greatly increased its sensitiveness. He was able to measure the radiation of 110 stars during a few weeks of work with the reflector at the Lick Observatory in the summer of 1914.

The investigation (e) visually and photographically, of the surface markings, etc., of celestial objects is an important part of the work of practical astronomy. The refractor has more generally been employed, but large reflectors can serve very usefully. Direct photographs of the sun's surface and spots (for which a refractor of small aperture, photographically corrected, then called a *photoheliograph*, is used) are made daily at several observatories. It is possible that at some time in the future the relation between the sun's activity and the weather will be sufficiently understood to be of the greatest importance to agriculture. The *spectroheliograph* is a particularly valuable instrument for photographing in desired monochromatic rays not only the surface markings (spots, *faculae*, *floculi*), but also the enormous gaseous eruptions, called prominences, around the edge of the sun. The calcium radiation at the H or K line is chiefly used. The instrument, which is fundamentally a spectroscope, was devised almost simultane-

ously by G. E. Hale at the Kenwood and Yerkes observatories and by H. Deslandres at the Meudon Observatory near Paris. Work with the *spectroheliograph* generally forms an important item in the program of an astrophysical observatory.

That portion of the surface of the moon (60 per cent) which is visible from the earth has been minutely studied, both visually and on photographs. No changes of importance have been established. The question of the origin of the moon is of interest to geology as well as to mathematical astronomy (celestial mechanics). To not a few observers there has been a particular fascination in the study of the changing surface-markings of the planets, particularly of Mars, Jupiter and Saturn. It was primarily for the investigation of Mars that the late Percival Lowell established his excellent private observatory at Flagstaff, Arizona. Photography has been successfully applied to several of the planets, but others, like Venus, are still shrouded in mystery as to their surface markings. Four new satellites of Jupiter and one of Saturn have recently been discovered photographically, besides hundreds of asteroids. If a planet exterior to Neptune should be found at some future time it will probably be picked up on a photograph.

The ever-increasing application of photography (f) to astronomical investigation has resulted in great progress and has to a large extent changed the character of observing. If a cluster containing perhaps thousands of stars in one field is to be measured and triangulated, the present procedure is to secure as good photographs as possible on nights when the atmospheric conditions are the best. One such photograph, secured with an exposure of perhaps two hours, may require months for its measurement and discussion. This work is done microscopically under measuring machines of the utmost precision in a convenient, well-lighted office rather than under the difficult conditions of visual observations in strained positions of the observer and with perhaps severely cold temperatures in the dome. It is found that nearly all kinds of relative measurements of celestial objects can be thus performed more accurately and more easily on good negatives than at the eyepiece of a telescope of even larger size than that with which the photograph was taken.

For finding the relative distances of the stars from their annual parallaxes, the photographic procedure with large refractors has been very successful in recent years and an important campaign in this work has been in progress, particularly in American observatories. When refractors corrected optically for visual observations are used photographically, a yellow filter is placed before the plate, which must be sensitive to yellow light.

The great international undertaking for the production of a photographic map of the entire heavens, known as the *Carte Celeste* or the *Astrographic Chart*, to include all stars as faint as the fourteenth magnitude, together with a catalogue of the measured positions of the stars as faint as the eleventh magnitude, was begun under the auspices of the Paris Observatory about 1887. It is only partially completed after about 30 years of labor. Practically all of the

necessary photographs have been secured. A nearly uniform type of photographic refractor with aperture of 33 centimeters (13 inches) and focal length of 343 centimeters (11¼ feet) was employed by the 19 co-operating observatories. The greatest part of the labor is required for the precise measurement of the positions of the stars involved, several millions in number, and the subsequent computations, all of which must ultimately be published with the fewest possible errors in the process of typesetting.

The whole sky has also been photographed with smaller instruments and on a correspondingly smaller scale. The Harvard Map of the Sky, taken with a lens of but one inch aperture and of only 13 inches focal length, is comprised in a set of 55 glass plates 8 by 10 inches in size. It records a vast amount of information.

Photography with a large reflecting telescope was used for important studies of nebulae by Keeler at the Lick Observatory and by Wolf at Heidelberg, showing vast numbers of spiral nebulae. Special provision has to be made in a modern observatory for the safe and dry storage of the great number of plates which accumulate.

The investigation (g) of the physical and chemical constitution of celestial objects has increasingly occupied attention at observatories in recent years and has affected the design and equipment of such institutions. Spectroscopes, generally for photography and called spectrographs, have been improved in design and efficiency. The spectra of over 300,000 stars have now been classified at the Harvard Observatory, on plates taken with one or more prisms put over the object-glasses of photographic refractors.

The type of spectrograph having a slit and apparatus for producing a spectrum of comparison from iron or other metal has been used for determining the velocity of celestial objects in the line of sight, and this has constituted a chief part in the program of some observatories with their principal refractors and reflectors since 1900. Such instruments have been applied successfully in measuring the rotation of Saturn's rings, of the planets themselves, and very recently to the rotation of the nebulae.

A new variety of very close double stars was revealed by the alternate double and single appearance of the lines in spectra of stars otherwise inseparable in the most powerful telescopes, and by the alternating approach and recession of stars revolving around close and invisible companions. The investigation of such interesting systems has occupied much of the time of the telescopes at several observatories. The interferometer, an instrument of the physical laboratory capable of measuring the most minute quantities, has been applied with great success to the measurement of wave-lengths in the solar spectrum. Adapted for photography, it has demonstrated that the gases of the interior of the Orion nebula are in a state of commotion, with relative velocities of several miles per second. For studies of cosmogony the knowledge of physical and chemical properties of the celestial objects is recognized as of fundamental importance.

Historical Notes.—The first suggestions of observatories are probably to be found in the

towers of the temples of the priests of the Babylonians, who required astronomical data to fix the dates of religious ceremonies. This may have been as early as between 4000 and 3000 B.C. The Babylonians or Chaldeans as they were often called made use of the gnomon, which was a vertical shaft or pillar erected on a level surface and served for determining the sun's position from the length of the shadow cast. The obelisks of the Egyptians were thus employed as astronomical instruments and perhaps were erected mainly for that purpose. The Greeks learned the use of this instrument from the Chaldeans and from the Egyptian priests. In the 6th century B.C., Anaximander, a disciple of the first Greek astronomical philosopher Thales, erected a gnomon at Lacedæmon. We may infer that Pythagoras used astronomical instruments.

The School of Alexandria, which flourished from B.C. 331 for more than seven centuries, contributed greatly to the development of mathematics and astronomy. Aristarchus of Samos was a careful observer in the 3d century B.C., and taught that the earth moved around the sun and believed that the planets also did so. We do not know what instruments he used. His follower, Eratosthenes (276-194 B.C.), designed an armillary sphere for the school at Alexandria with which observations were then made and important data determined. Hipparchus, who lived during the 2d century B.C., was an accurate observer and is justly regarded as a founder of the science of astronomical observation. His greatest discovery was that of the precession of the equinoxes. Ptolemy, living in the 2d century A.D., was the last great astronomer of the School of Alexandria.

With the rise of culture among the Arabs, especially under Haroun al Raschid, great interest in astronomy was developed, and by his son, Al Mamun, an observatory was built near the flourishing city of Bagdad. The Arabian prince, Albategnius (in the 9th century A.D.), was an industrious observer in Mesopotamia and in Damascus, where an observatory had been established earlier. The learning of the Arabs spread to Persia, where observatories were erected at Maraga and also at Samarcand.

Ulugh Beg, grandson of the Tartar Prince Tamerlane, re-established an observatory at Samarcand about 1420 and made important observations. At about the same time, Regiomontanus, a German astronomer, was provided with an observatory, well equipped, by a merchant prince at Nuremberg. The most elaborate observatory of the period before the invention of the telescope was that built for the Danish astronomer Tycho Brahe (1546-1601) on the island Hveen. It was called Uraniborg and with his excellent equipment Tycho made for many years highly accurate observations which led to the discovery by Kepler of the important laws which fully established the Copernican system.

The invention of the telescope was put into practical use in astronomy in the first decade of the 17th century, primarily by Galileo at Padua and Florence. Great precision in pointing at celestial objects was thus obtained and new instruments of observation were then developed.

National Observatories.—The national

observatories were founded particularly to aid navigation in solving the problem of finding the longitude at sea. The Royal Observatory at Greenwich was erected in 1675 by King Charles, for John Flamsteed, the first Astronomer Royal. It has maintained a leading place among observatories, particularly during the long directorate of Sir G. A. Airy (1835-81). The field of work of the observatory and the equipment have been much enlarged during the administration of Sir William Christie (1881-1910) and of the present Astronomer Royal, Sir Frank Dyson (1910-). In addition to departments for the time, for meridian observations, for the alt-azimuth, for heliographic work, for astrographic work and for double star work, the observatory has also a department of magnetic and meteorological observations. While fully maintaining the standard of its earlier work, the observatory is now highly efficient in all of these fields.

The Paris Observatory was erected during the years 1667-71. It has specialized in the determination of the position of celestial objects, with meridian instruments and equatorials. It contributed greatly to the introduction of photographic methods in astronomy, the brothers Henry having made photographic refractors and applied them successfully. A fine series of photographs of the moon has been taken with a large coudé and accurately measured. Pioneer work was done in the distribution of the time by wireless telegraphy from the Eiffel tower. For the first 120 years of its existence the observatory was directed by four of the Cassini family, son, grandson and great-grandson of the first. Among the later directors may be named Arago, Leverrier, Mouchez and Loewy.

The observatory at the Cape of Good Hope was established under the English Admiralty in 1820. Fundamental observations of position were its first care. Later, and particularly under Sir David Gill, the observatory was greatly enlarged and work with the heliometer, with photographic telescopes and with the spectroscope was added to its scope and improvements were made in all of the instrumental equipment.

The Russian observatory at Poulkova was founded in 1839 and fundamental observations of great accuracy, in addition to extensive observations of double stars, were conducted under W. Struve. Important work in stellar spectroscopy has been done there.

In 1844 the Naval Observatory at Washington was established by Lieutenant Gilliss, with F. M. Maury as its first director. Fundamental observations with various instruments and micrometric measurements with the equatorial have constituted the principal programs of work, in addition to the time service, which is distributed throughout the United States by telegraph. It has a department of nautical instruments, one for chronometers and for compasses and the important department of the Nautical Almanac.

The National Observatory of Argentina was completed at Cordoba in 1873 under the direction of B. A. Gould. Great catalogues were issued giving the places and brightness of the southern stars.

The first institution to be known as an astro-

physical observatory was that established at Potsdam (1874-78) by the Prussian government. H. C. Vogel was the first director. Very important work has been done here in solar and stellar spectroscopy and stellar photometry and photography and in other applications of physics to astronomy.

An astrophysical observatory was established at Meudon, near Paris, in 1876. Important work was accomplished in photographing the sun and its spectrum by the first director, J. Janssen, and by H. Deslandres with spectroheliographs of different types.

In 1918 the Canadian government erected at Victoria, B. C., a great silver-on-glass reflector of 72 inches aperture, equipped with a powerful spectrograph, which is now being successfully operated.

University Observatories in Europe.—

Some of the best-known university observatories are the following, to which are added the names of the observers who contributed most to their fame:

- 1751. Göttingen: Tobias Mayer, Gauss.
- 1765. Vienna: Von Littrow.
- 1771. Radcliffe Observatory, Oxford.
- 1776. Observatory of the Roman College: Secchi (1852-78) here observed the spectra of the sun and stars.
- 1811. Königsberg: Bessel here developed the art of astronomical observation to the highest point thus far attained.
- 1818. Munich: Lamont.
- 1835. Berlin: Encke.
- 1845. Bonn: Argelander established this observatory and made his Durchmusterung of the northern stars, giving approximate positions of over 300,000. This has served as the foundation for much future work.
- 1897-98. Heidelberg (Königstuhl): Max Wolf has conducted here some of the most important photographic observations of the heavens made in Europe and discovered large numbers of asteroids. He has also made important spectroscopic observations, in addition to many other varieties of work.

Among private observatories should be named that of William Herschel (1786-1827) at Slough near Windsor, whose observations were with his reflecting telescopes and, including the discovery of Uranus, made a new epoch in astronomy; this work was continued and extended by Sir John Herschel. The Earl of Rosse constructed at Parsonstown, Ireland, a great reflector in 1844, with which observations of the nebulae and of other objects were made by himself and his son. Sir William Huggins (1824-1910) in his private observatory at Upper Tulse Hill, London, made many important observations of the spectra of the stars and nebulae with the aid of photography.

Among contemporary American observatories, the following may be named as the most important ones: Harvard College, 1840, famous for work of the Bonds and from 1876-1919 of Edward C. Pickering, director, and his associates. The most extensive work in photographing the heavens by a single institution and of photographing the stellar spectra have been carried out under his administration, together with a vast amount of photometric work. To extend the work done at Cambridge to the southern hemisphere, a branch station was established at Arequipa, Peru, and equipped with powerful instruments.

At the University of Michigan, Ann Arbor, 1853, important research and instruction yielding valuable results, have been carried on continuously.

At the Dudley Observatory, at Albany, 1856, fundamental observations for position

and extensive cataloguing of the stars have been carried out by Lewis Boss and his son, Benjamin Boss. The work there of Ormsby McKnight Mitchel (q.v.) also was notable.

Allegheny Observatory, University of Pittsburgh, 1859. Important work on the heat of the sun and moon was done under S. P. Langley. A new observatory was built in 1900 with large instruments, used now for photographic astrometry and spectrography.

Dearborn Observatory, founded in Chicago in 1864 and transferred to Evanston, Northwestern University, in 1887. The excellent 18-inch refractor was used for observations of double stars and planets for many years by G. W. Hough and since by Philip Fox.

Lick Observatory, University of California, Mount Hamilton, was opened in 1888, with the 36-inch refractor by Clark as its principal instrument. Extensive campaigns of observation of double stars and micrometric observations of other objects have been made with this instrument. The observatory has taken a leading place in the determination of the motions of stars in the line of sight by the spectrographic method. For this purpose also a branch station has been established in Chile. Important observations of the nebulae have been made with the three-foot Crossley reflector. Refined fundamental observations have been made with the meridian circle. Extensive observations of solar eclipses have been carried out in different parts of the world. The directors have been E. S. Holden, 1888-98; James E. Keeler, 1898-1900; W. W. Campbell, 1900-.

Astrophysical Observatory of the Smithsonian Institution, Washington, 1889. This was founded by S. P. Langley for the study of the solar radiation with the bolometer and other appliances developed by Langley and C. G. Abbot, his successor as director.

Chamberlin Observatory, University of Denver, 1890. The large refractor has been used for micrometric observations under the direction of H. A. Howe.

University of Virginia, McCormick Observatory, 1882. The 26-inch refractor has been used for micrometric and photometric observations and latterly for determining stellar parallax by photography.

Lowell Observatory, Flagstaff, Ariz. This private observatory was established by Percival Lowell in 1894, particularly for the observation of the planet Mars. It has an excellent 24-inch refractor and a 40-inch reflector. Very important spectrographic observations have been made at this elevated station by V. M. Slipher, present director, on the velocity in the line of sight of the nebulae and their rotation and the motion in the line of sight of some of the star clusters.

University of Chicago, Yerkes Observatory, Williams Bay, Wis., was opened in 1897 under the directorship of George E. Hale, who developed here the use of the spectroheliograph, which he had begun earlier in Chicago. The great 40-inch equatorial refractor has been used by Burnham for double stars and by Barnard for extensive micrometric work. A large amount of time has also been given for spectrographic observations in determining the radial velocities of the stars. The method of using

a visually corrected refractor photographically was developed for this instrument by Ritchey, who employed a yellow filter and plates sensitive to rays of that color. For a dozen years this instrument has thus been applied successfully to the photographic determination of stellar parallaxes. The photographic study of the Milky Way has been carried on by Barnard with the Bruce photographic telescope and much photometric work, visual and photographic, has been done by J. A. Parkhurst, and by Edwin B. Frost since 1905.

Flower Observatory, University of Pennsylvania, Philadelphia, 1896. The principal work has been the study of variation of latitude and the observation of double stars under the direction of E. Doolittle.

Carnegie Institution of Washington, Mount Wilson Solar Observatory, Pasadena, Cal., 1904. This institution was inaugurated in 1904 by George E. Hale, present director. Its equipment comprises a large horizontal telescope with coelostat, known as the Snow telescope, two tower telescopes 60 and 150 feet high, a five-foot reflecting telescope provided with powerful spectrographs, also used for direct photography. A still larger reflector of 100 inches aperture is just being brought into use in 1919. A large laboratory is maintained at Pasadena and a great amount of work has been accomplished in many directions of astrophysics. A method has been developed by W. S. Adams for determining the distances of the stars from certain characteristics of their spectra. Important photographic and photometric researches on the study of stellar clusters are in progress.

Excellent equipment for instruction and research are also usefully employed at many other institutions, as Princeton University, Carleton College (Northfield, Minn.), Swarthmore College, Pennsylvania, the State universities of California, Wisconsin, Illinois, Ohio, Minnesota, Missouri; also at colleges for women, Vassar, Wellesley, Smith, Mount Holyoke.

EDWIN B. FROST,

Director of Yerkes Observatory, University of Chicago.

OBSIDIAN, a vitreous glass of volcanic origin, usually black or blackish green, but sometimes brown, red, gray, or banded with combinations of these colors, varying from opaque to translucent. It is chemically a rather complex silicate, most commonly of aluminum. Next to its vitreous appearance the most striking physical characteristic is its conchoidal fracture, which was utilized by primitive races for the making of knives and weapon-heads, ornaments and mirrors, notably by the Mexicans, who called the material *itztli* and quarried it in their mountains. The principal American variety is the chatoyante or cat's-eye, which contains a ruddy golden or silvery white gleam. The liparobsidians, or those resembling liparites, are best typified by the famous Obsidian Cliff in Yellowstone National Park. Other acid obsidians are found in California, Mexico, Hungary, the Lipari Islands and New Zealand. More basic sorts averaging 65 per cent of silica are found in Iceland, the Azores and Milo. The vitreous type (with about 53 per cent of silica) occurs in volcanic districts, notably various parts of Mexico, Kilauea and Réunion.

OBSTETRICAL FROG, or MIDWIFE TOAD, a small European frog (*Alytes obstetricans*) of the *Discoglossidae*, which has the general appearance of a smooth toad. The upper parts bear many warts and are variegated in color, reddish spots becoming conspicuous in the males at the breeding season, and the under parts are dull white. It is found in Spain, Portugal, southern France and Switzerland, on high mountains as well as in the lowlands, and in towns, gardens and parks as well as in the remotest wilds, wherever a little water is available for a home. The species is thus very numerous, yet is rarely seen, for it is nocturnal, hiding quietly by day in some dark nook or in a little hole dug in the ground by itself. At night, during all the warmer months, the males call to one another incessantly in a tinkling note which is not loud enough to be annoying. This frog gets its names from its peculiar manner of caring for its eggs. When the female feels the time approach for the discharge of her eggs, the male mounts upon her back and waits, assisting her efforts, for the extrusion of the ova, which at last happens suddenly. This takes place on land, not in the water. The eggs are comparatively large, and from 50 to 100 in number, connected by a gelatinous cord into two strings; and they are caught and retained, as in a dish, by the thighs of the female, which are extended straight behind her, close together. The male immediately fertilizes the eggs, and then proceeds to wind them about the upper part of his own legs, by thrusting his feet back and forth through the mass until they are fastened upon his thighs to his satisfaction. The female is then released, and the male carries his burden to his hole, where he remains, going abroad at night in search of food and to moisten the eggs in the dew, or occasionally in a puddle or pond. After about three weeks, the embryos are nearly mature, and the father takes them to the nearest water and remains within it until soon the tadpoles emerge. They are in a more advanced stage than in most frogs, but do not complete their metamorphosis until the following spring. Consult Fischer-Swigart, 'Zoologischer Garten' (Berlin 1885); Gadow, 'Amphibia and Reptiles' (1901).

OBSTETRICS, that department of medical practice which deals with the care and treatment of women during and after pregnancy and childbirth and with the care of the child when born. It is one of the most important branches of medicine. The study of all the parts of the female body concerned in the process of procreation, the healthy and sick functions during pregnancy and childbirth, besides the care of the mother and child during the early weeks following birth, all fall within its province. Although the function of child-bearing is strictly physiological, it is a process of great complexity and shows many variable features, so that in ancient as well as in modern times it has always caused an immense amount of sickness and suffering. Happily the art of obstetrics is being established on a rational and scientific basis, and the mortality, suffering and after-invalidism due to child-bearing are being reduced to a minimum. As would be natural with such a universal fact as reproduction, many and curious myths and customs have had

their day, to give way to equally fantastic ideas. Among ancient peoples obstetrics had its special workers, and among savages at the present time a crude obstetric art is practised. Among the Chinese in prehistoric times (3000 B.C.) midwives were the chief attendants on pregnant women. The length of pregnancy is given in the oldest existing works on medicine as 270 days. Women then were compelled to stay in bed at least three days and for 14 days were not allowed to see visitors. In ancient Assyria and Babylonia midwives were many, and to these women helpers was entrusted the care of the pregnant woman. This custom has continued to the present time, but with the gradual increase in education the better qualified physician is called upon with increasing benefit both to the mother and child. Physicians have also, however, been employed in this work since the earliest times. The modern era of obstetrics covers scarcely more than 30 years. The practical annihilation of puerperal sepsis by methods of cleanliness has revolutionized the whole subject of obstetrics, as the knowledge of bacterial infections has done with every branch of medicine. As the fœtus is practically under the control of the obstetrician at the present time, and as the danger of blood-poisoning can be eliminated, obstetrics, in the hands of the properly qualified, has risen to the level of an exact science. Women still die of childbed fever, but lack of proper care is the cause. Cleanliness is salvation. Dirty hands or finger-nails on the part of the nurse, midwife or doctor may be fatal, and every mother should know it. In different lands and races the earliest age of child-bearing varies from about 10 to 18. In European races the average is about 14 to 15. Women of warmer climates mature younger than those of the temperate zones. The general period of cessation of child-bearing is about the 45th year. Eight years is about the earliest authentic recorded age of pregnancy, and women of 60 or 70 have been known to have children. One case of pregnancy, with birth of child, is said to have occurred in a woman of 103 years, but the authenticity of this is doubtful. Following impregnation, which occurs physiologically only as a result of coitus, the ovum, which in the great majority of cases has previously come from the ovary, descends the Fallopian tube and becomes fastened to the wall of the uterus. Here a rich supply of blood-vessels grows up and around it to nourish the developing fœtus. This set of blood-vessels subsequently becomes the placenta, or after-birth, and constitutes the chief medium of blood-supply between mother and child. Following impregnation a characteristic series of symptoms occur in the pregnant woman. Menstruation ceases, as a rule, the breasts begin to give peculiar sensations, the woman urinates more frequently and her nipples have darker lines about them. These are the early signs. Later — from six weeks to a few months — she notes morning discomfort, with perhaps nausea and vomiting; constipation begins to annoy her; the abdomen begins to swell; the breasts become tender; and the bladder grows troublesome. Still later the nausea may disappear; the swelling uterus makes itself more and more prominent; the breasts become fuller, firmer and have a waxy exudation. At the end of

about nine months—270 to 280 days—labor begins. This is usually preceded for about two weeks by a distinct drop of the child in the pelvis, whereby the waist-line sinks very perceptibly. Labor is ushered in by some premonitory cramp-like growls, with inability to hold the urine and by the escapement of a certain amount of fluid in which the child has floated for the final three or four months or more. Irregular pains, which slowly increase in severity, cramp-like in character and intermittent, continue for from 4 to 24 hours or more. These constitute the first stage of labor and are premonitory and useful in dilating the opening of the uterus (q.v.), the cervix. The pains become more severe and frequent and longer in duration, and the second stage of labor, during which the child is to be squeezed out of the uterus, begins. This is a very distressing time and, were it not for the intermissions in the pain, would be unendurable. The pains become faster and harder, the bag of water usually bursts, and with further cramps the child progresses, head-first, through the vagina into the world. Here meeting with a cold reception when compared to the warmth of the body from which he came, he reflexly cries out and with cleansed mouth, takes his fill of air.

Following the birth of the child there is a quiescent period for a few moments to half an hour, then with further pain the uterus squeezes out the afterbirth, and the third stage of labor is completed. The cord connecting the child and the placenta is cut between two knots and the infant becomes an entity. The length of time of the second stage varies widely. In first children, and in older women, with the first baby particularly, it is apt to be longer. From two to six hours may be said to be the average. Following the birth the mother should lie in bed and the child be put to her breast at regular two-hour intervals. Although the milk will not come for a few days, the child begins a regular habit and the breast receives its physiological stimulus. It is wise for the young mother to remain in bed at least 10 days, as this favors the return of the uterus to its normal condition.

OBSTFELDER, Sigbjörn, Norwegian novelist: b. 1866; d. 1900. In 1897, with 'The Red Drops' and 'The Cross' this young author came into prominence as opening a new field in Norwegian literature. The promise of a brilliant future was closed by his death in a hospital in Copenhagen in August 1900. He left in manuscript a notable book 'A Priest's Diary,' posthumously published (1901).

OBSTRUCTION, a term applied to the policy which intentionally impedes progress in a legislative body for party or factional purposes. In the United States House of Representatives during the 80's of the 19th century, the policy of obstruction became such a serious abuse, that drastic remedies had to be applied to check the evil. By motions to adjourn to a certain day and to take a recess the time of the House of Representatives was wasted and the power of the majority to control legislation was seriously threatened. Both motions were subject to two amendments upon each of which as well as upon the original motion the yeas and nays could be demanded by one-fifth of the members present. These motions could be repeated without limit and the time of the house wasted in

useless roll-calls. In the 50th Congress on one occasion the house remained in continuous session for eight days and nights during which time there were over 800 roll-calls on motions to adjourn and to take a recess. Speaker Reed in 1890 announced that he would henceforth refuse to entertain such motions and the practice he established was embodied in the rules of succeeding Congresses. Rule XVI, section 10, as revised in 1911, stipulates that "no dilatory motion shall be entertained by the speaker." See CLOSURE; FILIBUSTERING IN LEGISLATION.

OBVERSION, from the Latin *obvertere*, to turn toward or against, used in logic as a form of immediate inference in which, by changing the quality from one proposition another is inferred, having a contradictory predicate. The import of the judgment remains unchanged. The original proposition is called the obvertend, and that from which it is inferred is called the obverse. The logical term obversion is also called permutation.

OC, Land of, the name given to the country in which Provençal is spoken in the south of France. The term is specifically applied to it by the members of the Félibrige Society. See PROVENÇAL LANGUAGE; PROVENÇAL LITERATURE; FÉLIBRIGE.

OCALA, ô-kä'la, Fla., city, county-seat of Marion County, on the Ocala Northern, the Ocala and Southwestern and the Seaboard Air lines, about 160 miles in direct line southeast of Tallahassee, and 70 miles southwest of Saint Augustine. The noted Silver Spring is about five miles east of Ocala. It is in a region in which are raised large quantities of cotton, oranges and vegetables. Other products which are sent to Northern markets are lemons and sweet potatoes. It has considerable trade in phosphate found in the vicinity. The sewerage system is most unique, it being formed by a subterranean river, which was accidentally discovered while drilling for a well. Neither the source nor the mouth of the river has been discovered. The city owns and operates the electric-light plant. Pop. 5,002.

OCALA PLATFORM, in American politics, a series of resolutions passed at the national congress of the Farmers' Alliance, held at Ocala, Fla., 8 Dec. 1890. It demanded the abolition of national banks; the establishment of sub-treasuries which should lend money directly to the people at low rates of interest, free coinage of silver, low tariff, the prohibition of alien ownership of land and a graduated income tax.

O'CALLAGHAN, ô-käl'a-hän, Edmund Bailey, Irish-American historian: b. Mallow, County Cork, Ireland, 27 May 1797; d. New York, 27 May 1880. He was educated in Ireland and in France. He removed to Canada in 1823, where in 1827 he became a medical practitioner, and was editor of the *Vindicator*, the organ of the Society of the Friends of Ireland (1834). He was elected to the assembly of Quebec in 1836, but after the insurrection (1837-38) he removed to the United States to escape the consequences of the part he took in the insurrection. He spent many years in the office of the secretary of state at Albany employed in editing the records of the State. He wrote 'History of the New Netherlands'

(1846); 'Documentary History of the State of New York' (4 vols., 1849-51); 'Documents Relating to the History of New York' (11 vols., 1855-61); 'A Calendar of the Land Papers' (1864); 'Voyages of the Slavers Saint John and Arms' (1867).

OCAÑA, ò-kā'ña, Colombia, town in the department of Santander, on the Taira River, 230 miles north of Bogotá. It was founded in 1572, and is the commercial centre for the coal, anise, hides, lead, coffee and other products of the district. From Ocaña extensive trade is carried on with parts of Venezuela and down the Magdalena River. Pop. 17,200.

OCARINA, òk-a-rē'na, a musical instrument extensively used in Calabria by the peasants, and said to be of Tyrolese or Austrian origin. Prior to the discovery of America an instrument similar in form and make was in use among the Aztecs and other more cultured races of Mexico; and it is still found there in the mountainous districts. The Chinese *hsüan*, in use 3000 B.C., is the earliest known prototype of the ocarina. It consists of a gourd-shaped clay bulb, pierced with a number of small holes and a mouthpiece. Its tone was sweet, but the range was exceedingly limited—less than an octave—but in the course of subsequent development its compass and power were greatly augmented.

O'CAROLAN, Turlogh, Irish musician-poet. See CAROLAN.

OCCAM, òk'am, or **OCKHAM**, William of, mediæval controversialist, of the Franciscan order, known as "VENERABILIS INCEPTOR" and "DOCTOR INVINCIBILIS": b. Ockham, Surrey, 1270; d. Munich, 7 April 1349. He was educated at Oxford, where he studied under Duns Scotus, and subsequently proceeded to the University of Paris. He took part (1321) in the controversy on the subject of "evangelical poverty," and was present at the general chapter of Perugia, which decided it in the following year. Pope John XXII condemned the decision of the chapter, and Occam defended it against him, for which he was by order of the Pope imprisoned at Avignon. He escaped, however (1328), and a vessel sent by Louis the Bavarian conveyed him to Italy. The Pope excommunicated the fugitive and vainly tried to get him sent back to Avignon, but Occam from that time resided at the court of Louis and engaged in polemical warfare with papal authority. He charged John XXII with teaching heresies, and when Louis in 1348 declared the imperial accession independent of papal confirmation Occam supported him. On the death of Michael da Cesena in 1342 he became general of his order, though not recognized by the Pope. In logic and philosophy Occam occupies a distinguished place. His principal work is 'Summa Totius Logices.' Consult Lindsey, T. M., 'Occam and his Connection with the Reformation' (London 1872); Little, A. G., 'Gray Friars of Oxford' (Oxford 1892); Riezler, 'Die literarischen Widersacher der Päpste zur Zeit Ludwig des Baierns' (1874); and Poole's article in the 'Dictionary of National Biography,' Vol. XLI.

OCCANEECHI INDIANS, an American tribe of the Siouan family residing in southern Virginia in the 17th century. When they first appear in American history in 1670 their

chief town was upon an island at the junction of the Staunton and Dan rivers near Clarks-ville. Their tongue became the general trade language of a very considerable extent of country. They aided the white settlers against the invasion of northern Indians in 1676. In these wars they suffered so severely that they were not able to hold their own against their enemies, so in 1701 they removed to North Carolina, near the present town of Hillsboro, and disappeared by uniting with other tribes. Consult Mooney, James, 'Siouan Tribes of the East' (Washington 1894).

OCCASIONAL CAUSES. See DESCARTES, RENÉ; METAPHYSICS.

OCCLEVE, òk'klēv, or **HOCCEVE**, Thomas, English poet of the 15th century: b. about 1370; d. about 1450, both dates being based merely on the internal evidence of his poems. For 24 years he was a clerk in the Privy Seal office, London. He evidently knew Chaucer, and the famous portrait of Chaucer on the margin of the Harleian manuscript of the 'De Regimine Principum' is believed to have been drawn by Occleve himself. This work (Concerning the Duties of Kings) was, for the most part, a digest of the Latin treatise bearing the same title by Ægidius Colonna. It is in the prologue to it that Occleve gives the few details of his life that are known. Besides this poem, which was edited by Wright in 1860, Occleve wrote the autobiographic sketch 'La Male Regle de T. Occleve,' and various shorter poems, the most notable being the 'Mother of God,' an orison to the Virgin, long attributed to Chaucer. Occleve's poems are edited by Furnivall (1892-97).

OCCCLUSION, in chemistry, a name given by Graham to the property of metals to absorb, or hold in solution, gases. This property is most remarkably displayed by platinum and palladium in their affinity for hydrogen, of which platinum will absorb 114 times its own volume and palladium between 700 and 800 times its own volume. The entire class of oxides illustrates again this special kind of absorption. The term is also used of mere surface condensation, as of ammonia or oxygen in charcoal.

OCCOM, òk'òm, Samson, Indian preacher: b. Mohegan, New London County, Conn., about 1723; d. New Stockbridge, N. Y., 14 July 1792. He entered the Indian school of Rev. Eleazar Wheelock at Lebanon, where he remained four years. In 1748 he kept a school in New London, but shortly after removed to Montauk, Long Island, where he taught and, as a licensed Congregational minister, preached to the Indians. In 1759 he was ordained to the Presbyterian ministry, with which he remained connected. In 1766 he went to England with Rev. Nathaniel Whitaker as an agent for Moor's Indian charity school. Being the first Indian preacher who had visited that country, he was successful in attracting large audiences and obtaining donations exceeding £10,000. After his return to America, Occom preached at various places, passing his latter years within the bounds of the Albany presbytery. He wrote an account of the Montauk Indians, printed in the (Massachusetts) Historical Society collections (1st series, Vol. X), and published a sermon on the execution of an Indian at New Haven in 1772.

OCCULTATION. The occultations of stars and planets by the moon, as in its eastward motion during the month it passes in front of star or planet and blots them for a while from view, have, in a measure, their counterpart in occultations of stars by planets or by comets, and also in the occultations of satellites by their primaries.

Occultations of the Moon.—The general theory of occultations is analogous to that of solar eclipses. (See *ECLIPSE*, *Bibliography*). For stellar occultations, however, considerable simplification occurs because the apparent radius of the occulted body is indefinitely small and there are but two instants to be computed, namely, the immersion or disappearance of the star and its emersion or reappearance from behind the moon's disc. The elements for the prediction of the occultations of stars are given in all the national ephemerides, chiefly according to Bessel's method. In the 'American Ephemeris' these elements are given for stars down to 7.5 magnitude. Observations of the occultations of stars are chiefly valuable as furnishing indispensable data for determining the distance, size and motions of the moon. (See *MOON*). The accuracy of a lunar position thus determined is many times that of the ordinary meridian observations of the moon's limb. The occasion of a total lunar eclipse offers special facilities for determining with great accuracy the occultations of a number of small stars. The best lunar method of determining the longitude of a place is that of observing the occultations of stars, and it has only been superseded by the telegraphic method of the comparison of signals.

The immersion and emersion of stars in occultations by the moon are accompanied by phenomena of a varied character, which have been the subject of much discussion. Some astronomers have been willing to dispose of all these phenomena by vaguely describing them as due to physiological causes, without attempting any scientific explanation and without satisfying the experience of the more acute and sensitive observers. The various phenomena noted may be scheduled as follows: (1) Instantaneous disappearance or reappearance of the star. (2) Apparent projection of the star upon the moon's limb. (3) Sudden change of magnitude. (4) A slow disappearance or reappearance, sometimes described as "gliding." The instantaneous immersion or emersion of the dark limb is naturally to be expected, and is readily accounted for by the assumption that the moon has no appreciable atmosphere, and that the apparent angular diameter of the stars is insensibly small. This instantaneous disappearance is very usual under conditions of good seeing, although under such conditions also, when the star apparently approaches closely to the moon's serrations along the dark north or south limb, it has been seen to disappear behind a mountain and reappear in the next valley, and so on. Such instances have been particularly noted by the elder Bond and by Davidson. These disappearances and reappearances are to be distinguished sharply from those not associated with the finest definition. Sensible displacement of stars with respect to the moon at occultation, or a "clinging" upon the lunar limb, has frequently been observed, and although attributed

by Innes to improper focusing, or focusing on the red star so as to throw the moon's image out with respect to it, it is probably, as Davidson suggests, due to the formation of a "fictitious or spurious limb" of the moon by irregular refraction, upon which the star is projected through the unconsciously selective action of the eye on the star image. It is chiefly large, bright and mostly red stars, like Aldebaran and Antares, that have been projected from the whitish, spurious border of the moon. "With a large, colored star," says Davidson, "all the phases of this phenomenon are unmistakable; with a large white star they may be somewhat in doubt; with a small white star, they will probably not be noted, especially in small telescopes with low power." With this phenomenon the true immersion is still instantaneous. Sudden decrease in the magnitude of the disappearing star, as if in two distinct stages, has again and again been noted by expert observers. In certain instances this distinct phenomenon has been proved to be due, and in all cases is probably due, to the occultation of a double star. It seems likely that a very close observation of these light changes at occultation will more and more be deemed a valuable means of detecting very close double stars lying in the moon's path. The "gliding" or gradual occultation of stars is, with some show of probability, attributed by Innes to occultation of double stars too close to make a separate physiological impress. He thinks that close doubles of a period too long for spectroscopic discovery and yet too close for visual detection may thus reveal themselves by the magnification due to the appreciable interval taken by the moon in traversing an arc too small for direct measurement. In both of the cases of "disappearance in two distinct stages" and of "gliding" the position angle of the double star with respect to the moon's path, as well as the angular separation of the components, enters as a factor of the delicate phenomena.

That the disturbance and reappearance of a star in nearly all cases appears to be absolutely instantaneous is not surprising when we consider the great distances which separate all of the stars from the solar system. A very simple computation shows that were even the nearest star to have a diameter of 1,000,000 miles, its apparent angular diameter as seen from the earth would be but 0.0076 inches, and the time occupied by the advancing edge of the moon in passing across this apparent disc would be less than two-hundredths of a second. If we suppose that a star of the same size is 10 times as far away, the time would be but one-tenth as great as this. It cannot be doubted that the time required for the complete extinction of a star's light, in the great majority of cases, does not exceed one-thousandth of a second. This is far too small an interval to be directly observed, and no photographic device for recording the necessarily gradual extinction of the light has yet been successfully invented. If, however, such an apparatus shall be secured, it will enable us to directly measure the apparent angular diameter of the stars—quantities far too small for us to observe by any methods at present known to us.

Occultations of Planets.—The phenomena attendant upon occultations of planets by the

moon differ somewhat from those of stars. The beautiful and startling appearance which Venus and the new moon present to the unaided eye at the time of this planet's occultation, and the early association of the new moon with religious festivals, has led to the crystalization of this phenomenon as a symbol on the Turkish flag and is also thrice emblazoned on the Egyptian. The phenomenon of an occultation of Jupiter, photographed and visually observed at Arequipa in 1892, led W. H. Pickering to an interesting discussion of the apparent effect of a slight lunar atmosphere. Of an occultation of Saturn, 3 Sept. 1900, G. G. Tupman says that it "disappeared at dark limb, which was not visible except on the planet and ring. The last little patch of light, longer than broad, parallel to the moon's limb, seemed to linger strangely. The distance of centres was diminishing 0.28 inch per second, and the moon seemed to travel very rapidly across the planet and ring." It seems undesirable to speculate on this phenomenon further than to class it with similar phenomena of displacement of stars at the occulting limb of the moon.

Occultations by Planets.—The observation of the occultations of stars by planets may be utilized in determining the position and diameter of the planets and in securing some knowledge of the effect of their atmospheres on the phenomena. The prediction of these occultations by planets was for some time annually made by Berberich of the 'Astronomisches Jahrbuch.' The phenomena of immersion and emersion have, in the cases of Mars as observed by South, of Venus by Curruli, been practically instantaneous. Only a slight hesitancy in reappearance was noted in the latter case. An occultation of a 6.5 magnitude star by Jupiter, as recently observed by H. Struve, gave the times of the immersion and the emersion uncertain from 7 to 10 seconds and showed these times to be phenomena of a gradual character.

Occultations of Satellites.—The occultations of Jupiter's satellites by the planet are a part of the general theory of the configuration of the Jovian System as seen from the earth, and are regularly predicted in the *American Ephemeris* and *Nautical Almanac* and other Ephemerides. The projection of the satellites within the apparent limb of Jupiter at occultation has been seen by many observers and is satisfactorily explained by the effects of atmospheric disturbances on the planetary edge just as in the case of the star's projection on the disturbed and spurious limb of the moon.

Occultations by Comets.—The passage of comets over stars, as visually and photographically observed, has disclosed some facts of interest in this class of occultations. Until quite recently all observers agreed that the nebulous envelopes of comets do not absorb the light of stars, and long ago Olbers had shown that there was no evidence of refraction by comets. One eminent observer after another has recorded the occultation of a star or cluster of stars by a comet without sensible diminution of the light of the stars, and this phenomenon has also been markedly attested by the photography of comets. A few observers have noted the diminution or even the complete extinction of stellar light in their occultations by comets. Max Wolf has, moreover, recently demon-

strated by photography that the envelope of Comet 1903c exercised a selective absorption on a 6.5 magnitude star and that the same comet failed to absorb the light of a less brilliant star of a different type. The projection of the stars upon the envelopes and tails of comets thus not only affords means for accurate measurement of the position and form of these objects, but promises to supply occasional hints of the cometary absorption of stellar light.

Bibliography.—Bessel's method of treating predictions of occultations is given in 'Astronomische Nachrichten' (No. 145). A number of graphical, or partly graphical, methods, useful to observers in predicting occultations, have been published in recent years. Among these may be mentioned the suggestions of G. W. Hough in *Popular Astronomy* for 1897; Major Grant's diagram given in 'Hints to Travellers'; M. J. Bijourdan, 'Occultations' in the 'Annales de l'Observatoire de Paris' (Vol. XXIII), and the graphical method of Rigge, No. 3786, *Astronomische Nachrichten*. In the same journal (No. 2388) Seeliger has discussed the conditions of frequency of occultation of stars by planets.

Revised by ERIC DOOLITTLE.

OCCULTISM (from the Latin *occultare*, to hide), deals with the doctrines, principles or practice of occult science, such as magic, theosophy, mysticism, etc. Occultism deals with forces of nature, not generally known, and is chiefly kept up in the Eastern countries, particularly in India. Dr. Joseph Grasset, in his 'L'Occultisme hier et aujourd'hui' (Paris 1907), writes: "Occultism is not a survey of all things hidden from science; it is a survey of facts not yet belonging to science (*positive* science, after August Comte's manner), but which may belong to it. Occult facts are outside of science, or in the vestibule of science, endeavoring to conquer the right to be included in the text of the book of science, or to cross the threshold of the palace. There is no logical situation which hinders these facts from ceasing one day to be occult and becoming scientific. Charles Richet calls them metaphysical. As they are really psychical, I should rather term them *juxta-* or *pre-scientific*. To the word metaphysical Boirac prefers the term *paraphysical*, in which the prefix *para* indicates precisely that exceptional and paradoxical phenomena are in question—phenomena quite outside the known principles of thought and life. One might describe *paraphysical* phenomena as all phenomena manifesting themselves among living beings, or through their actions; and as being not entirely explained by nature's principles and powers as already known.

"The attractions of a scientific mystery have not been the appanage of any one epoch; but one divides into three periods the stopping-places of the prescientific wonders of the modern age: the period of Mesmer; the period of Spiritualism; and the present day."

Mesmerism, or animal magnetism, introduced by Mesmer (1734-1815), was derived, in fact, from the works of Paracelsus of the 16th century; Spiritualism originated in the United States in 1847; and the end of the 19th century witnessed a new spirit which Paulhan spoke of in 'Le Nouveau Mysticisme' (1891) as "a mysticism that, far from repelling the scien-

tific system willingly seeks it." From this time onward occultism has assumed the aspect of a serious study. Among those, to quote from Charles Richet, who "endeavor, or have endeavored, to make a number of mysterious and unseizable phenomena pass into the sphere of positive sciences" are Aksakoff, William Crookes, Dariex, Durand, De Gros, Gibier, De Grammont, Joseph Grasset, Pierre Janet, Sir Oliver Lodge, Lombroso, Maxwell, F. H. Myers, Ochorowicz, Charles Richet, De Rochas, Sabatier, Stainton Moses, R. Wallace, De Wetleville and Zoellner.

An impetus was given to the scientific study of occultism in 1893, when De Grasset presided at the Montpellier Faculty of Medicine during the presentation of a thesis about occult phenomena. Albert Coste in 'Les phénomènes psychiques occultes' (2d ed., 1895), made an official report of the actual condition of the subject. At the same time, Dariex, wishing to establish in France a similar work to that of the Society for Psychical Research, already promoted in London, issued the *Annales des Sciences Psychiques*, which contains much documentation of all these questions. These investigators "limit occultism," in the words of Dr. Grasset, "to the investigation of phenomena that, first, does not belong to science; second, that may without logical hindrance belong to it later on. In a word occultism is the pre-scientific Wonders." (See MAGIC; MYSTICISM; THEOSOPHY; SPIRITUALISM). ESTHER SINGLETON.

OCCUPANCY. See POSSESSION.

OCCUPATION, Diseases of. See DISEASES, OCCUPATIONAL.

OCEAN, The, or SEA, comprises the continuous body of water which covers the greater part of the earth's surface, the area being two and one-half times that of the dry land. The latter is for its greater part aggregated on the northern hemisphere, the southern is pre-eminently oceanic. The ocean is divided into five great divisions which have partly natural, partly imaginary boundaries.

The Pacific, the largest one, is bounded on the east by America and the meridian of Cape Horn, on the west by Asia, the Great Sunda Islands, Australia and the meridian of Tasmania, on the north it terminates in Bering Strait and on the south at the Antarctic circle.

The Atlantic Ocean, the next in size, is bounded on the east by the coasts of Europe, Africa and the meridian of Cape Agulhas, on the west by America and the meridian of Cape Horn and on the north and south by the Arctic and Antarctic circles respectively.

The Indian Ocean is bounded on the east by the Great Sunda Islands, the west and south coast of Australia and the meridian of Tasmania, on the west by the coast of Africa and the meridian of Cape Agulhas, on the north by Asia and on the south by the Antarctic circle.

The Arctic and Antarctic Oceans comprise the waters between the Arctic circle and the North Pole, the Antarctic circle and the South Pole, respectively. The actual boundaries of the oceans do not always agree with these theoretical ones; thus the northern coasts of America, Europe and Asia are the actual boundaries of the Arctic Ocean; Hudson Bay and the White Sea are included, although they reach

far into the temperate zone. Furthermore, the Arctic circle is not the actual boundary between the Arctic Ocean and the Atlantic, but a line drawn from Greenland to Norway by way of Iceland, the Farøe and Shetland islands. From a morphological point of view there is no such thing as an Antarctic Ocean; there are no land surfaces or submerged ridges that separate it from the adjoining oceans. The area should properly be divided among the adjoining great oceans—the Atlantic, Pacific and Indian; when we speak popularly of Antarctic Sea and Antarctic expeditions we refer to the entire region that lies south of the extreme southern points of the land masses, Cape Horn, Cape Agulhas and Tasmania, in lat. 56° S., 34° 51' S. and 43° 40' S., respectively.

Area.—The areas of the three great oceans are given at 67.7 million square miles for the Pacific, 34.7 for the Atlantic and 18.6 for the Indian. The two Polar seas are much smaller, but no exact figures can be given for the reason that there are about 3.1 million square miles in the North Polar regions and 8.3 in the South Polar regions still unexplored. As to dimensions the Pacific is the widest, with 9,400 nautical miles between Panama and the Philippines; the Atlantic is much narrower, about 3,700 nautical miles between Cape Agulhas and the La Plata, or 4,500 miles between Cape Bojador on the African Coast and the Rio Grande, if we include the Gulf of Mexico. The Indian Ocean has its greatest width between the southern capes of Africa and Australia, over 6,000 nautical miles. The distribution of islands plays a prominent part in the physiognomy of the oceans. We have to distinguish between oceanic and continental islands. The open Atlantic is rather poor in oceanic islands, more so is the eastern part of the Pacific, and especially poor is the northern part of the latter ocean and the eastern part of the Indian Ocean. The south Pacific is unsurpassed for its wealth of oceanic islands; "small size" is a characteristic feature of these islands, in fact the hundreds and thousands of Polynesian islands have a total area less than that of Celebes. Each ocean has its share of continental islands, which includes not only those near continents, but also such as have a continental structure, of which New Zealand is a type. The Pacific has its East Indian Archipelago, New Guinea, etc.; the Atlantic, the British Islands, the Antilles; the Indian Ocean, Madagascar and Ceylon; the Arctic, Greenland, Nova Zembla, etc. According to size Greenland with 0.81 million square miles heads the list of large continental islands, with the New Guinea, Borneo, Madagascar, Sumatra, Nipon, Celebes, Java and Cuba following in the order of size. There is yet another element which imparts diversity of character, not only to different oceans, but to different parts of the same ocean—the development of the coast line. An ample development, the presence of deep incisions, is considered a great factor in the promotion of culture. Europe with the Mediterranean, Baltic, North Sea and English Channel; the eastern coast of North America with the Gulf of Saint Lawrence, the Gulf of Mexico and the Caribbean Sea, are especially favored in this respect, while the absence of deep incisions is noticeable in the contour lines of the southern continents, notably Africa and South America. A very

peculiar feature in this respect is the border seas which line the eastern coast of Asia; these are in succession, commencing at Bering Strait, the Bering Sea, Okhotsk Sea, Japan Sea, East Sea and South China Sea. A very rich development, though on a smaller scale, is imparted by glacial action to coast lines in northern regions; we notice this especially on the coasts of Norway, Iceland, Greenland and the northeast and northwest coasts of America.

Depth.—The mean elevation of the land surface is estimated at about 383 fathoms, and the mean depth of the sea at between 1,900 and 2,000 fathoms, hence the latter is about five times as great as the former; but, in spite of this disparity, the culminating heights of the land (the Gaurisankar with 29,000 feet) approach very nearly the greatest depths of the sea (the Guam trench with 5,269 fathoms or 31,614 feet). The mean depth of the three great oceans is about the same, the Pacific is slightly deeper and the Indian rather shallower than the Atlantic Ocean.

The bed of the Atlantic has a peculiar form: instead of one deep basin separating the Old and New Worlds, as it was thought to be 50 years ago, there are two separate troughs, one on the American and the other on the European side, separated by a rise which commences at Iceland and passes through the middle of the ocean, taking in on its course the Azores, Saint Paul and Ascension islands, and has been traced as far as lat. 40° S. This rise was formerly designated the Dolphin Rise, but in modern nomenclature it is Atlantic Rise. The troughs, which are divided by gentle swells into several basins, terminate on the south in two cross ridges, the Rio Grande and Whale ridges, and on the north in a ridge stretching from Greenland to Iceland and thence to the Shetland Islands. It is called the Icelandic Ridge and has a depth of less than 328 fathoms. The depth of the basins exceeds 3,000 fathoms (3,825 southeast of the Bermudas). The greatest depth, however, 4,662 fathoms, is not found in these basins, but in a trench off Porto Rico which terminates in the Old Bahama Channel. It has been noticed that the arms of the north Atlantic in the higher latitudes, like the Baltic, North Sea and English Channel on the European side, and Hudson Bay and the Gulf of Saint Lawrence on the American side, are shallow, while those in lower latitudes have comparatively great depths, the Mediterranean 2,406 fathoms, the Bay of Biscay 2,625 fathoms, the Gulf of Mexico 2,119 fathoms and the Caribbean Sea 3,428 fathoms.

In the Pacific we find the northern part decidedly deeper than the southern. In about lat. 20° N. are the Hawaiian Islands rising from a plateau of over 1,000 fathoms depth and to the northward and southward of it are basins with over 3,000 fathoms depth which extend in an east and west direction over the greater part of the width of the ocean. The southeastern Pacific or, more definitely speaking, that part to the eastward of the Marquesas and other coral islands, appears to have been more charily located by the explorers and surveyors than any other part of the great oceans. We have no exact knowledge of the disposition of its basins and ridges, but may form some conception of the depths from the observation that, barring the immediate vicinity of the coast,

there are no soundings recorded of less depth than 1,450 fathoms, or more than 2,711 fathoms. Farther west we notice the groups of innumerable coral islands which have become historic from the investigations of Forster, Darwin, Dana and A. Agassiz. They rise rather precipitously from depths of between 1,000 and 3,000 fathoms. Only passages of very moderate depth lead from the deep parts of the western Pacific into the Indian Ocean through the archipelago of islands which separates Asia from Australia, but within this archipelago there are several basins which show rather remarkable depths—the China Sea with 2,715 fathoms, the Sulu Sea with 2,550 fathoms, the Celebes Sea with 2,795 fathoms, the Banda Sea with 4,000 fathoms and the Coral Sea with 2,518 fathoms. The uniformity of these depths appears to indicate that these successive basins were at some remote period parts of a continuous sea and that their separation is due to volcanic eruptions. The discovery within the last 30 years of several areas of local depression in different parts of the Pacific whose depth is far in excess of those of the large basins, also leads to the supposition that they are the result of violent volcanic action. They are found in close proximity to the coast of the mainland or close to chains of islands in the shape of longitudinal depressions, designated as trenches. The deepest one of these trenches is the Guam with 5,269 fathoms (the deepest sounding ever recorded), the Kermadec-Tonga with 5,155 fathoms, the Japan with 4,656 fathoms, the Aleutian with 4,037 and the Atacama, off the coast of Peru and Chile, with 4,175 fathoms depth.

Of the three great oceans the Indian appears to be the least complicated in form, having only one great basin of 3,532 fathoms depth; this is found in its eastern part, in the bight formed by the west coast of Australia and the Great Sunda Islands.

The Arctic Ocean may properly be divided into two parts, separated by Greenland, which descends into the temperate zone to lat. 60°. The eastern part lies north of Europe and Asia and the western part north of America. This ocean was formerly credited with very moderate depths, less than 700 fathoms, this mainly for the reason that the regions earliest known, those just north of the continents, were very shoal, but late Arctic expeditions have shown the existence of a deep trough, 2,650 fathoms between Greenland and Spitzbergen, which is taken as a continuation of that of the Atlantic beyond the Icelandic ridge, and also depths of over 2,000 fathoms far to the eastward and northward of Spitzbergen, indicating the existence of another large basin. In the western part we find at Davis Strait, in about the latitude of the Arctic circle, a barrier of 360 fathoms depth which separates the trough of the western Atlantic from Baffin Bay. Except Baffin Bay, which has depths of over 1,000 fathoms, the entire region to the westward as far as Bering Strait seems to be shallow; in Bering Strait the greatest depth is only 28 fathoms.

Since the time of the Antarctic expedition of Wilkes and James Ross (1839-43) the opinion has prevailed that the Antarctic Ocean was one of inferior depth and that a gradual shoaling would have to be expected from the south-

ern parts of the great oceans toward the Antarctic continent. This opinion was based upon the nature of the soundings which Ross took near the newly-discovered land and which indicated a rapid shoaling, but has been dispelled by the results of the recent Antarctic expeditions which show depths of over 3,000 fathoms to the southward of Africa in about lat. 60° S., 2,975 fathoms between Madagascar and Kerguelen Island, and between the latter and the Antarctic Continent 2,540 fathoms. We are rather interested in the depths existing between the southern capes of the continents and the nearest land to the southward in order to ascertain if any submarine connections exist, such as we have traced between North America and Asia on one side and Europe on the other. Between the Cape of Good Hope and Bouvet Island 2,962 fathoms have been found, between Cape Horn and the New Shetland Islands 2,106 fathoms; there are no soundings between Australia and the Antarctic Continent, but rather less than 2,000 fathoms are expected.

Composition and Density of Sea Water.—

The briny taste and higher specific gravity of sea water than fresh water is due to the presence of salts, held in solution, and although the absolute quantities of these salts are very variable, the relative proportions are always very nearly the same. In 1,000 parts of sea water are found on an average 26.9 parts of chloride of sodium (common salt), 3.2 parts of chloride of magnesium, 2.2 parts of sulphate of magnesium, 1.3 parts of sulphate of lime and 0.7 residue.

The salinity is increased by evaporation on the surface, and although this is supposed to be always active, it is greatly promoted by high temperature and strong dry winds. The salinity is diminished by the addition of fresh water either from rivers, rain or melting ice. The highest salinity is found in the regions of the trade winds with the following results: 37.9 in the north Atlantic, 37.6 in the south Atlantic, 36.4 in the Indian Ocean, 35.9 in the north and 36.9 in the south Pacific, each in 1,000 parts of water. Between these regions of high salinity in approximately lat. 20° to 30° both north and south, there is found in the neighborhood of the equator a zone of low salinity, 35.5 to 35.0 in the Atlantic and 34.5 to 34.0 in the Pacific, and this is attributed to heavy rains and weak, humid winds. In the higher latitudes a rapid decrease of salinity is noticed with increase of latitude, except in regions that are reached by the Gulf Stream drift; thus a density of 35 is found beyond lat. 76° N. between Spitzbergen and Norway, while in the southern oceans this density is not met with far beyond lat. 40° S., and not so far in the north Pacific. The Gulf Stream, which is fed by the highly saline waters which both the north and south trade winds convey to the eastern shores of North America, has a density at least as high as the north Atlantic in the trade-wind regions, while several arms of the sea in the Bahamas have a density greater still.

The greatest densities, exceeding those of the open ocean, are found in land-locked basins in warm and dry climates; thus we find 41 in the Red Sea, 38 in the Persian Gulf, 37 in the Mediterranean. Copious additions of river water reduce the salinity, and for this reason

we find low densities along the eastern and Gulf coasts of the United States, and when such waters empty into basins with narrow entrances we observe even lower degrees of salinity, thus 15 to 18 in the Black Sea and from 5 to 8 in the Baltic. Salinity is also reduced by melting ice, as we notice especially in the north Atlantic, where two mighty currents, the East Greenland and the Labrador, carry vast quantities of ice in the shape of bergs and floes from the Arctic regions toward the south. Concerning the vertical distribution of salinity, it has been noticed that it decreases to the depth of 200 to 300 fathoms in those regions where a decided evaporation takes place, like the trade-wind regions, and increases to the same depths where a dilution occurs; that beyond these depths it decreases slowly to the depth of 1,400 to 1,830 fathoms, thence increases again until bottom is reached. In the inland seas, however, the density generally increases as the depth to the bottom.

Temperatures.—The rule holds good generally that the mean annual temperature of the surface waters is somewhat higher than that of the air, and that it fluctuates much less. The warmest water is found at the equator, and here the Indian Ocean and the western Pacific exceed in heat the Atlantic and eastern Pacific. From these equatorial regions there is a gradual decrease in temperatures north and south, but the temperatures of northern regions are generally higher than those of the southern in corresponding latitudes for the reason that the warm water which is carried by the southern trades across the equator is replaced by cold water from the Antarctic regions, which is assumed to be the coldest on earth. Furthermore, in the higher northern latitudes the eastern parts of the oceans are warmer than the western, the drift being northeast, and again, the northeast Atlantic is much warmer than the northeast Pacific for the reason that the Gulf Stream is a much more powerful stream than the Kuroshio. The warm waters which we meet at the equator reach to the depth of only about 50 fathoms, the cold waters which we meet beyond that depth are assumed to come from the Antarctic regions. In the regions of the trade winds the surface water, made heavy by evaporation, descends, and hence we find here in depths of from 50 to 250 fathoms the water from 4° to 6° warmer than in the equatorial regions. But this water moves not only downward, but drifts to greater distances from the equator. The last traces of these tropical waters we find in the bottom layers of the Arctic and Antarctic oceans; this water has parted with nearly all the heat with which it, started on its journey, by supplying cold currents and by melting ice, but still retains enough salt to betray its origin.

From the bottom regions of the Arctic Ocean there is a slow movement of the water toward the equator and although that from the north polar regions starts with much lower temperatures, between -2° to -3° C., it rapidly gains heat and shows temperatures of from $+1^{\circ}$ to $+2^{\circ}$ C. in middle northern latitudes, while under the equator and in southern latitudes the bottom temperatures do not vary greatly from 0° C. This distribution leads to the assumption that the cold waters which in the equatorial regions rise toward the surface

are of Antarctic origin. Theoretically no ice should be formed on the surface of the sea water until the whole body of water has been reduced to less than $-2\frac{1}{2}^{\circ}$ C., but in the Arctic regions freezing generally takes place before this temperature is reached, on account of the slowness of vertical circulation, and warm layers are often found under the surface ice. For seven or eight months of the year the entire Arctic Ocean, with the exception of the southern parts of the Greenland Sea and Baffin Bay, is covered with ice. In the Atlantic, Iceland, the British Islands and the coast of Norway; in the Pacific the Pribilof Islands and Aleutian Islands are free of ice all the year round. Thawing in the Arctic regions commences about the end of May. The Arctic summer is rather short; new ice begins to form in September. The discovery of a "northwest passage" from the Atlantic to the Pacific furnishes the motive for the greater number of expeditions commencing with those of Cook (1778) and Vancouver (1792-94) on the Pacific side of America, and those of Parry (1819-24) and Ross (1831-33) on the Atlantic side; these undertakings were finally abandoned only after human endurance had been put to its severest tests and many lives sacrificed in the vain endeavor. Nordenskjöld in 1878-79 successfully accomplished the northeast passage by way of the Siberian coast; but the experience of subsequent expeditions teaches that the chances for finding an open passage all the way through are rather uncertain. In the Atlantic two great currents convey the melted ice with its freight of bergs and floes from the Arctic regions, the East Greenland and Labrador currents. The first one, after following the east coast of Greenland to Cape Farewell, turns north along the eastern side of Davis Strait, crosses over to the western side before reaching Baffin Bay and joins the Labrador current. The latter flows along the Labrador coast, sends a branch through the Strait of Belle Isle; but the principal part passes along the Newfoundland coast and banks and, if not dissipated by the warm waters of the Gulf Stream, dips under it. Here on the southern edge of the Banks of Newfoundland we witness the most rapid change of temperature found in any part of the ocean, in May 10° , from 5° to 15° , within two degrees of latitude, or from the temperature off the coast of Iceland to that off the coast of Spain. There are no Arctic currents on this grand scale in the Pacific; the ice generally disappears a short distance south of the Pribilof Islands. In the Southern hemisphere we have a vast region of floe ice the limit of which is lat. 57° S. off Cape Horn and 38° S. off Cape of Good Hope. The vertical distribution of temperature in enclosed basins is essentially different from that in the open ocean by decreasing from the surface downward to the depth of the channel which opens into the ocean and remaining constant thence to the bottom. Thus in the Celebes Sea a uniform temperature of 3.8° is found between 860 fathoms and the bottom (2,795 fathoms), while in the adjoining Sulu Sea, with about the same depth, the temperature is 10.3° below 400 fathoms. In the Gulf of Mexico and the Caribbean Sea a uniform temperature of 4.2° is found below 900 fathoms, and in the Mediterranean, with a depth of less

than 200 fathoms in the Strait of Gibraltar, the temperature from about 270 fathoms to the bottom is 13°.

The Bottom of the Sea is different in many respects from the surface of the land. The mantle of sea water protects it from subaerial disintegration and erosion which gives such a varied shape to the landscape and although sea water may decompose the bottom of the ocean, there are no currents strong enough to transport the residue to distant regions. While the land surface is constantly reduced by denudation, the bottom of the sea receives constant accessions. The materials which contribute to this process are either of continental or pelagic origin. The first are either such as the ceaseless actions of the waves remove from exposed parts of the coast or material brought down to the coast by the rivers. The currents carry these materials out to sea and, while the heavier ones, such as gravel and coarse sand, remain near the shore, the lighter ones, as fine sand, silt and mud, are transported to considerable distances before they sink to the bottom. In this way the coast is lined with a fringe of continental deposits which may be quite narrow, but often attains a width of 100 miles or more. This fringe is designated as continental shelf; when broad it has a moderate slope and is generally assumed to terminate with the 100-fathom curve. It is succeeded by a well-defined steeper slope called the continental slope. Continental or terrigenous deposits are often found at considerable distances from the coast, disconnected from the shore deposits; in such cases they are formed by conflicting currents losing their velocity and depositing the sand and silt which they carry. These deposits, called sand banks, often constitute dangers to navigation. In the higher latitudes melting icebergs and floes produce banks; in this way the large Newfoundland Banks, 270 miles wide, are supposed to have been formed.

The finest terrigenous material, designated as mud, is carried to sea far beyond the 100-fathom limit and in the shape of blue, red, green, volcanic and coral mud covers about one-seventh part of the ocean's bottom to depths of over 1,000 fathoms. These "muds" also cover the bottom of the large continental basins with the exception of the Gulf of Mexico and Caribbean Sea, and prevail in the Arctic Seas. The continental slope generally descends very gently from the "shelf" to the trough of the sea, but there are instances of quite steep descent; such are met with off the west coast of Europe, Africa, Mexico and South America, also near volcanic and coral islands. But the bottom of the deep troughs and basins nearly everywhere presents the profile of the dead level of a vast plain. Although animal life presents its contribution to the continental deposits in the shape of broken shells of mollusca, etc., they occupy only an accessory position, and it is in the deeper parts of the ocean that they constitute the principal component. Globigerina ooze, composed mainly of the microscopic shells of a genus Foraminifera, covers over one-third of the ocean's bottom; it prevails in the medium depths and especially where there are warm currents, like the Gulf Stream. The largest area is found in the Atlantic Ocean; it predominates in the northwestern part of the Indian, but is re-

stricted to the Polynesian Plateau in the Pacific Ocean. A variation of this ooze, which contains large proportions of mollusca shells, principally those of Pteropods, is called Pteropod ooze and is found on the central ridges of the Atlantic, in depths not exceeding 1,400 fathoms, and also in the Gulf of Mexico and Caribbean Sea. The red clay occupies the greater depths of the ocean and a larger area than any other deposit, more than one-fourth of the earth's surface. It is a genuine clay and assumed to be the result of the decomposition of pumice and other volcanic materials. The absence of shells in this deposit is not thought to be proof of the absence of animal life; apparently the shells have been dissolved by the free carbonic acid of the sea water and absorbed by the latter before reaching bottom. In some of the deepest parts of the Indian and in the eastern Pacific, silicious radiolarian remains are found in such quantities in the red clay that this kind of deposit has been designated radiolarian ooze. See OCEAN CURRENTS; OOZE.

OCEAN CABLES. See CABLES, SUBMARINE.

OCEAN CURRENTS. The surface of the ocean is very rarely in a state of perfect rest. We make a distinction between vertical and perceptible horizontal motion; the latter we call *currents*. Near the coast, in channels and estuaries, the currents are referred to a variety of causes, among which the tides are the most important, but in the open sea the winds are recognized as the primary cause of all the great currents. A regular and continuous wind blowing over the surface of the ocean will induce motion in its surface, but the velocity communicated to the water is always far less than that of the air producing it. In consequence of the viscosity of the water the motion of the surface will be transmitted in part to greater or less depth but greatly diminishing rapidly below the surface. The rate of this motion in a body of water and the depth to which it penetrates are altogether a question of time, and it has been demonstrated that if the winds act continuously upon an unconfined ocean the entire body of water from surface to bottom will have motion imparted to it. Furthermore, the momentum acquired by the water in motion will carry it on in its course for a considerable time with slowly diminishing velocities, should the wind cease to blow.

The trade winds are those which in the Atlantic and Pacific oceans blow with great regularity all the year round on both sides of the equator in the Northern hemisphere from the northeast and in the southern from the southeast. In the Atlantic the southeast trades are the prevailing winds between the Cape of Good Hope and Rio de Janeiro to the equator, the northeast trades between lat. 12° N. and about lat. 30° N. The two regions are separated

by a region of light changeable winds and calms called the equatorial calms or doldrums. The trade winds induce currents on the ocean's surface called the North and South Equatorial Currents respectively. The limits approximate those of the corresponding trade winds; the northern lies between lat. 10° and 28° N. and has a mean velocity of 14 miles per day, the southern between lat. 15° S. and the equator and has a mean velocity of 16 miles per day. The South Equatorial Current from about long. 20° W. passes north of the equator; this may be due partly to the southeastern trades which extend into the Northern hemisphere and partly to the configuration of the South American coast which compels the current to take a northwesterly course. It finally enters the Caribbean Sea through the different passages among the Lesser Antilles; a small portion, however, separates from the main body and moves south, following the South American coast. Between the two Equatorial Currents we find the Guinea Current which belongs to a secondary class, called compensating currents, which always run in an opposite direction to the primary, and are explained by a natural tendency of the water to restore equilibrium disturbed by the primary current. The Guinea Current commences about $35\frac{1}{2}^{\circ}$ W., attains a velocity of 15 miles, and on reaching the coast of Africa, near Cape Palmas, passes into the Gulf of Guinea. One part of the waters which the North Equatorial Current conveys to the American shores enters the Caribbean Sea and joins those of the South Equatorial; the other part moves along the Bahamas toward the northwest. The waters which the Equatorial Currents carry into the Caribbean Sea are assumed to acquire their motion partly from the impulse of the trades, partly in consequence of the prevailing easterly winds and to pile up against the western shores. Very little doubt is entertained at present that the current through the Strait of Yucatan into the Gulf of Mexico, which is one of the strongest on record (from 60 to 120 miles per day), is solely due to the difference of level between the Caribbean Sea and the Gulf. But these waters do not tarry in the Gulf of Mexico, its level being in turn higher than that of the Atlantic; they are, consequently, forced toward the Strait of Florida where they find an outlet, enter the Atlantic as the celebrated Gulf Stream, a name first used by Franklin. In the narrowest part of the channel, off Cape Florida, it approaches the coast to within 15 miles, occupies the entire width (40 miles) and depth (482 fathoms) of the channel and attains velocities of 69 to 100 miles per day at the surface. By calculation it has been shown that a current of the velocity of the Gulf Stream requires a difference of elevation of at least 0.7 feet of the Gulf over the Atlantic, which difference agrees very nearly with that found by direct leveling across the Florida Peninsula. After leaving the Straits, the Gulf Stream moves to the northward over a rocky bottom with a depth of 460 to 270 fathoms, and distant from the coast about 100 nautical miles. In lat. 34° it enters the deep water of the ocean; when off Cape Hatteras, it again approaches the coast, being distant only 35 miles and in depths of over 1,500 fathoms. Its temperature there is 31° C. in summer and 26° C. in winter, having lost only 3° since leaving the Straits of Florida.

It is readily recognized by its high temperature and dark blue color, its western edge being especially well defined. It is not a deep current; at the depth of 250 fathoms its temperature is 10° C., under its western edge it is 7.2° , while under its eastern edge a temperature of 15.6° is found. This appears to indicate that it moves over a wedge of cold water which comes from the north and west and descends toward the east into the depths of the ocean. The width of the Stream off Hatteras is about the same as in the Straits of Florida, 40 miles, and its velocity is between 50 and 73 miles per day. After leaving Cape Hatteras it gradually changes its northeast direction into due west with constantly diminishing velocity and temperature until it reaches the southern edge of the Banks of Newfoundland which it does in summer in lat. $42\frac{1}{2}^{\circ}$ N. and in winter in $41\frac{1}{2}^{\circ}$ N., with temperatures of 22° C. and 10° C. respectively and velocity of 24 to 30 miles per day. It is here no longer considered as an ocean current but a drift, and is called the Gulf Stream drift. The deflection of the Gulf Stream toward the east is attributed partly to the rotation of the earth and partly to the direction of the prevailing winds. While the central part of the Gulf Stream drift makes its way toward the western shores of Europe and moderates their climate, one part enters Davis Strait and produces an open channel to the southern part of Baffin Bay during winter; another one passes into Denmark Strait between Iceland and Greenland, but it soon sinks into the depths of the sea. A more persistent branch passes between Iceland and the British Islands and the coast of Norway, and has been traced to the eastward as far as the west coasts of Spitzbergen and Nova Zembla during the summer season. The southern part of the Gulf Stream drift, more properly called Atlantic drift, leaves the main body south of the Azores and, as the North African Current, follows the coast of Africa to Cape Blanco where it joins the North Equatorial Current. The vast oval-shaped area enclosed by the North Equatorial Current, the Gulf Stream and the Gulf Stream drift is one of calms and weak drifts, and is called the Sargasso Sea from the sea-weed which accumulates about its borders.

Turning to the currents that descend from the polar region into the temperate zone, we find in the removal of vast bodies of water from the western part of the ocean to the eastern of the Gulf Stream the cause of other currents, compensating currents, whose function it is to move waters in the opposite direction, from the northeast to the southwest, for the purpose of restoring equilibrium, as in the Labrador current. The prevailing northwesterly winds in Baffin Bay assist such a movement along the coast of Labrador and Newfoundland to the southward, and this direction is maintained until Cape Race has been passed where it is changed to southwest on account of the rotation of the earth. This current is active during the season of melting ice. Field ice generally appears on the Banks as early as February and disappears about the end of May. Icebergs are most abundant in May and are found in diminishing numbers until the end of August. The majority of bergs come from the west coast of Greenland (some few come from Frobisher Sound and Hudson Strait), and move

at the rate of about 10 miles per day. Similar conditions to those existing in Baffin Bay produce a southerly current along the east coast of Greenland, called the Greenland Current, which rounds Cape Farewell and turns to the northward toward the depression which the Labrador Current has created in Baffin Bay. After skirting the ice barrier which usually exists in Davis Strait in the spring, it merges into the Labrador Current. The temperature of these currents is very low, but their density is comparatively high for the season that they are shallow and rest on warm and heavy waters and have been constantly gaining salt during their progress. Being comparatively heavy the Labrador Current sinks under the Gulf Stream. The cold waters which extend along the western edge of the Gulf Stream as far as Cape Florida have sometimes been considered a continuation of the Labrador Current, but it appears that the movement of these waters toward the southwest is extremely slow and disguised by the more powerful motion produced by the winds and tides. Furthermore, the movement of this littoral band is retarded by warm currents making their way into the Gulf of Saint Lawrence and Gulf of Maine. In conformity with the laws of oceanic circulation as now understood, the waters of the Labrador Current as well as the cold waters of the coast regions pass beneath the edge of the Gulf Stream (which is very thin) and continue to sink and move along the slope of the continental plateau as they drift slowly southward until they reach the bottom of the ocean with a temperature of 2.2° . The existence of a cold wall along the western edge of the Gulf Stream and cold bands within its limits, which were discovered by the early Gulf Stream explorations and which have since been denied and reaffirmed, can hardly be considered as permanent features; similar bands are often noticed in thin superficial currents and are the consequence of underlying cold water being forced to the surface either by lateral pressure or by the sinking of the warm water by reason of evaporation or loss of heat.

That part of the South Equatorial Current which turns to the southward off Cape San Roque, called the Brazilian Current, is quite weak, having a velocity less than 20 miles per day; off the Falkland Islands it is joined by the Cape Horn Current which comes from the southern Pacific and crosses the south Atlantic. When off Cape of Good Hope this "Westwind drift" turns to the northward and as a cold current, the Benzucla Current, flows along the west coast of Africa with a velocity of 12 to 20 miles per day. Off the mouth of the Kongo it turns to the westward and joins the South Equatorial.

The currents of the Pacific are similar to those of the Atlantic. The North Equatorial has its origin near the Revillagigedo Islands off the coast of Mexico, in long. 110° , flows between lats. 10° N. and 20° N. in a westerly direction across the entire width of the ocean to the Philippines, about 7,500 miles, with a velocity of 12 to 18 miles per day. The South Equatorial extends from lat. 15° S. to the equator and has its greatest velocity near its northern edge. It has a mean velocity of 24 miles per day, but this is often more than doubled in the eastern part. In the neighborhood of the Fiji Islands it divides, one part, the northern, known as the Rossel Current, passing

through the various passages among the Polynesian Islands toward Torres Strait and the north coast of New Guinea; the southern branch called the Australian Current, trends toward the east coast of Australia with a velocity of 24 miles, but gradually loses strength and is deflected toward the southeast. The Equatorial Counter-Current, setting toward the east, commences at Mindanao in the Philippines and extends to the Bay of Panama and is especially strong during the period from June to October. The Japan Current, or Kuroshiwo, is a continuation of the North Equatorial and is the Gulf Stream of the Pacific. Starting from the east coast of Luzon, it passes the east coast of Formosa; changing its course to the northeast, it makes for the southwestern point of Japan. Off this point the current divides; the major portion passes through Van Diemen Strait and the passages between the Linschoten Islands, and runs parallel to the south shores of the Japanese Islands, attaining its greatest velocity of 48 to 72 miles per day. It leaves the coast of Japan after having reached Cape Maboye, to the eastward of Yokohama, and turns to the northeast, like the Gulf Stream off Cape Hatteras, without, however, reaching beyond the latitude of 40° N. One branch of the Kuroshiwo parts from the main stream before Van Diemen Strait has been reached, enters the Japan Sea through the Korea Channel and follows the west coast of Japan to La Perouse Strait, through which it passes into the Okhotsk Sea and flowing along the west shores of the Kurile Islands it can be traced to the west shore of Kamchatka Peninsula. The strength of the Kuroshiwo is greatly influenced by the winds of the western Pacific; during the summer months, between the middle of May and the beginning of October, the southwest monsoon blows on the coast of China to lat. 20° N., and is followed during the winter by the northeast monsoon which retards the stream, hence it has its greatest strength in August and its least in March when it is hardly recognized as a warm stream. It is an open question whether a branch of the Kuroshiwo enters the Bering Sea. The currents here are so feeble and so much influenced by the winds and tides that their record does not convey any definite information; but from the fact that the southwestern, or deeper, part of this sea is always free of ice while the northeastern, or shoaler, part during the winter months is covered with an impenetrable mass of ice we may safely conclude that warm water from the Pacific enters the sea, if not as an active current, at least as a powerful drift. In confirmation of this supposition we find in the deeper parts of the sea during August a mean surface temperature of 7.4° , at the depth of 100 fathoms a minimum of 2.9° , at 200 fathoms a maximum of 3.4° , and at 1,000 fathoms 1.9° , with salinity increasing regularly from surface to bottom. The breaking up of the ice for some distance northward of Bering Strait indicates that a portion of the current passes through the strait. In long. 150° W. the Kuroshiwo can no longer be considered a warm current; it thence gradually assumed a more southerly direction and passes the coast of California as a cold current, the California Current, and finally merges into the North Equatorial in about long. 130° W. The east Australian Current, corresponding to the

Brazilian of the Atlantic, is regarded as a warm current; it has a width of 40 miles, with its inner edge about 20 miles off shore, and shows velocities of from 12 to 72 miles. South of Tasmania and New Zealand we find the same westerly winds and easterly drift that we noticed in the south Atlantic. On reaching the South American coast a branch of this drift turns to the northward past the coast of Chile and Peru and joins the South Equatorial southward of the Galapagos Islands. This current has a velocity of only 15 miles and is generally supposed to produce the comparatively low temperatures prevailing along the west coast of South America, but these are more correctly attributable to the cold water which rises from the bottom to the surface near the coast. There are no Arctic currents in the Pacific on the grand scale of the Labrador, no icebergs and the ice in Bering Sea is not very compact. In fact the trips over the ice by the natives of both Asia and America in the depth of winter to visit their kinsfolk on Diomed Island, in the middle of Bering Strait, are considered hazardous ventures. The ice in winter extends from Bristol Bay to some miles to the northward of Saint Paul Island, thence northwest to Cape Navarin; in the summer months, August, September and early October, the Arctic pack ice extends from Icy Cape on the coast of Alaska to Herald Island. Floating ice is found as far south as 35 miles to the southward of the Pribilof Islands and to about 60° lat., off the coast of Kamchatka. Along this coast there is a cold current in spring and early summer; this is reinforced by cold water which by strong tidal currents may reach the eastern shores of the Kurile Islands through Amphitrite and other straits from Okhotsk Sea. This cold current, the Kurile Current, carries quantities of Arctic ice and is noted for its low temperatures from surface to bottom. It follows the east coast of Japan as far as Van Diemen Strait, is interposed between the shore and the Kuroshio and is known as Oya Siwo (green water).

The Indian Ocean shows different conditions from those of the other two great oceans for the reason that its northern limit is within the torrid zone. During the summer months the southeast trade winds pass the equator and are changed into southwest winds or southwest monsoon. During the rest of the year from October to April, the northeast monsoon, which corresponds to the northeast trade winds of the other oceans, blows over the northern part of the ocean. During this period the currents north of the equator have a northwesterly direction, attaining especially great velocities off Ceylon (80 miles) and the east coast of Africa. During the southwest monsoon the water north of the equator moves in the opposite direction, from west to east toward Sumatra, and again attains its greatest velocity off Ceylon. In the Southern hemisphere between the latitudes of 7° and 20° S. the Equatorial Current flows to the west during the whole year with velocities of between 12 and 36 miles, sometimes as much as 60 miles. Off the east coast of Madagascar the current divides into a northern and southern branch. A part of the northern branch turns to the northwest, reaching the Bay of Zanzibar during the southwest monsoon and turning into the Equatorial Coun-

ter-Current during northeast monsoon. The other part rounds the northern Cape of Madagascar with velocities of 18 to 48 miles and enters the Mozambique Channel as the Mozambique Current. During the northeast monsoon the Equatorial Counter-Current is found between the equator and lat. 7° S. with velocities of from 12 to 18 miles. Its function is to restore the equilibrium by carrying back part of the waters removed by the Equatorial Currents from the eastern part of the ocean. During the southwest monsoon the eastern flow extends over the whole ocean north of lat. 5° S., with velocities of more than 48 miles at the equator. The Agulhas Current is a continuation of the Mozambique Current; it has a velocity of 46 to 51 miles and off Cape of Good Hope meets the cold water from the vicinity of Cape Horn. The collision of the two currents produces streaks of alternate warm and cold water, differing 8° or more in temperature, a feature which has attracted the attention of many navigators.

The most noticeable feature of the currents in the Arctic Ocean is the almost universal eastward and southeastward set north of the American continent and the generally westward set north of Siberia, although at a considerable distance from the mainland. Both currents seem to originate north of Bering Strait and the fact that they set out from this locality in nearly opposite directions has suggested the existence of a large island or continent between the Pole and Bering Strait.

In the Antarctic regions, or rather those to the southward of Tasmania, Cape Horn and the Cape of Good Hope, the drift is generally from west to east, in conformity with the prevailing westerly winds.

In conclusion it may be of interest to notice one or two currents which in a strict sense may not be considered ocean currents but which may explain the function of difference of density in the production of currents. In the Mediterranean we have noticed a higher density in consequence of evaporation than is possessed by the adjoining ocean. In consequence of this difference there is a surface inflow of ocean water with a velocity of 48 to 72 miles and an undercurrent of the denser water into the ocean. On the other hand the density of the Baltic is less than that of the adjoining North Sea, hence we have a surface current from the Baltic into the North Sea and an undercurrent in the opposite direction.

OCEAN DISASTERS. See DISASTERS OF THE WORLD, NOTABLE.

OCEAN GROVE, N. J., town in Monmouth County, on the Atlantic Ocean and on the Central of New Jersey and the Pennsylvania railroads, 54 miles south of New York. It is a famous summer resort on account of its fine beach and the ease of access from New York, Philadelphia and other cities. It adjoins Asbury Park (q.v.); Wesley Lake is on the boundary. The Ocean Grove Camp Meeting Association of the Methodist Episcopal Church controls the town and regulates its laws. The sale of intoxicants and tobacco and theatrical performances are prohibited. The Sunday laws are strict and rigidly enforced. The prominent buildings are the Auditorium, which seats 10,000 persons, cost \$75,000 and was dedicated 9 Aug. 1894; the public school building and the post office. Religious meetings are held in the Auditorium. The school building, called the Neptune Township High School, cost \$72,000. The Association owns and operates the electric-light plant and the waterworks. The Association was organized in 1869; but the first permanent building, a wooden frame covered with green boughs, was not erected until 1875. In 1874 a stand for the speakers had been erected and the audiences sat on temporary seats made by placing planks on trestles. There are several large hotels and boarding-houses and many summer cottages. In the summer months the population varies from 20,000 to 30,000. The winter population is about 3,000.

OCEANA, ō-shē-ā'na, or **ENGLAND AND HER COLONIES**, a work of travel by James Anthony Froude, published in 1886. This is the record of a journey made by the author via Cape Town to Australia and New Zealand and home by way of Samoa, the Sandwich Islands, San Francisco, Salt Lake, Chicago and New York, in 1884-85.

OCEANIC DEPOSITS. See OCEAN; OOZE; section on *Oceans* in article on GEOLOGY; and section on *Sedimentary Rocks* in article on ROCKS.

OCEANIC LIFE. See BENTHOS; DEEP SEA LIFE; DEEP SEA EXPLORATION; FISHES, GEOGRAPHICAL DISTRIBUTION OF; GLOBIGERINA; OOZE; PLANKTON; SEaweeds; ZOOGEOGRAPHY, etc.

OCEANICA, ō-shē-ān'i-ka, **OCEANA,** or **OCEANIA**, the name given to the land division of the world which is composed of islands in the Pacific Ocean. The limits of Oceanica are not well defined; some geographers include in this division all the oceanic islands in the Pacific, others include the East Indian Archipelago. A subdivision of Oceanica adopted by many is into Western Oceanica or Malaysia,

corresponding with what is better known by the name of the Malay Indian or East Indian Archipelago, Micronesia or Northern Oceanica, Polynesia or Eastern Oceanica, and Melanesia or Southern Oceanica. The islands and peoples of Oceanica will be found described under their respective titles.

OCEANIDS, in Greek mythology, a class of nymphs, daughters of Oceanus and Tethys. They were 3,000 in number and were said to have an equal number of brothers. See MYTHOLOGY.

OCEANOGRAPHY. Oceanography is the science which treats of the physics and biology of the ocean, including the extent and conformation of the basins, the deposits which cover the bed, the depth, physical and chemical properties, motions and circulation of its waters, and the nature and distribution of marine organisms.

As a result of the marine hydrographic coast surveys of the various maritime countries, undertaken in the interests of navigation, the coast-line of the world is now among its best-known geographical features, and hence, since geodesists have determined the size of the terrestrial spheroid, the area of the oceanic surface of the globe is known with closeness to 140,000,000 square statute miles, which is an expanse exceeding the total area of the lands of the globe by 83,000,000 square statute miles. In other words, 71 per cent of the surface of the globe is covered by the waters of the ocean. Although the depth of the ocean has been measured in many thousand places throughout the world since the middle of the 19th century when deep-sea soundings first began to be successfully made, yet there are oceanic areas as large as the United States where no soundings have been made, and many others where the present soundings are but widely spaced. The contours of the oceanic basins cannot, therefore, be completely drawn at present and the volume of the ocean may only be stated by estimation to be 324,000,000 cubic statute miles; or 14 times the bulk of all the lands in the world above sea-level. The accepted measurements of the areas within the different zones of depth are given in the following table:

DEPTH IN FATHOMS	Estimated area in square statute miles	Percentage of total ocean floor
Between 0 and 1000....	22,000,000	16
" 1000 " 2000....	27,000,000	19
" 2000 " 3000....	81,000,000	58
" 3000 " 4000....	9,800,000	7
" 4000 " 5000....	195,000	Less than 1
Exceeding 5000....	5,000	

The mean depth of the ocean is 2,080 fathoms and the greatest depth, which is found east of the island of Mindanao, is 5,348 fathoms.

In their general extent and position, it is likely that ocean basins have been permanent since the waters were gathered together. The study of deep-sea observations does not support the view that, by alternate rising and sinking of the earth's crust, oceans and continents have successively occupied the same areas.

Traces of all known chemical elements have been found in the waters of the ocean and if there are any that are unknown traces of them will be found there. Although the total amount of salts contained in sea water varies in different parts of the ocean, the existing proportions

set forth in the following table, according to Dittmar's analysis, are practically the same in all parts and at all depths of the open ocean:

	Parts per thousand
Sodium chloride.....	27.213
Magnesium chloride.....	3.807
Magnesium sulphate.....	1.658
Calcium sulphate.....	1.260
Potassium sulphate.....	0.863
Calcium carbonate.....	0.123
Magnesium bromide.....	0.076

The dissolved substances are present mainly as ions. Of the elements in solution, sodium and chlorine seem to be the only ones that are not withdrawn by organisms and organic processes, and they may therefore have been uniformly on the increase since the beginning of geological time. This conclusion has been made use of in the calculations which have assigned 100,000,000 years as the age of the ocean.

The average value of the salinity of the surface waters of the ocean is 35 parts in a thousand parts of water. The factors affecting its variation are evaporation, dilution and the action of winds. In the Red Sea, where the rate of evaporation is high and the rainfall small, the salinity rises to 39, while, under the opposite conditions of the China Sea, it falls to 34. In the borders of the frigid zones, as well as in the doldrums of the tropics, the salinity is reduced and in the trade-wind regions increased. In general, there is a small decrease of salinity with increasing depth in the open ocean down to about 1,000 fathoms and below that a tendency to increase is observable.

The gases of the atmosphere are everywhere contained in sea water, but the proportions in which they are present are different in the atmosphere and the ocean, because of the varying capacity of water to dissolve them. Dry air contains about 21 per cent of oxygen, but air extracted from sea water contains about 34 per cent. The gas content of sea water is chiefly made up of nitrogen and oxygen, together with small quantities of free carbonic acid and traces of argon and neon.

While the nitrogen suffers little or no diminution, the oxygen is continually being used up by the processes of marine organisms, so that, if it were not being constantly dissolved at the surface and distributed by the general circulation, the proportion of oxygen in the depths would be reduced below the amount necessary to support the animal life which now abounds there. The rate of solubility varies with the temperature in such a manner that more gas is absorbed at low than at high temperature. Since the rate of solubility is greater at low than at high temperatures, the polar waters are found to contain as high as 24 parts of oxygen and nitrogen per thousand parts of water while tropical waters contain as low as 12 parts.

It is in respect of temperature that the ocean exhibits many of its most significant characteristics. Over 80 per cent of its bulk remains at a temperature below 40° F. More than 90 per cent of the sea-floor is thus covered, including all these vast regions, in depths greater than 2,000 fathoms, where the temperature is uniformly found to be within the range of a few degrees above the freezing point of fresh water. Salt water freezes at a lower

temperature than fresh water; sea-water with a salinity of 35 per thousand freezes at 28° F. and it is not uncommon to find temperatures but little above this in the waters of the polar seas. About 16 per cent of the entire ocean surface has a temperature below 40° F. In the surface waters of lower latitudes there is a progressive rise in temperature, reaching the average of 80° at the equator; but the position of the isothermal lines is much modified by prevailing winds, by the situation of land-masses and by distribution of areas of barometric maxima and minima. The warmer surface waters occupy only a comparatively small depth even in the tropics. The following table gives the mean temperatures for the whole ocean, as calculated from all observations in all latitudes at the specified depths:

DEPTH IN FATHOMS	Mean Fahrenheit temperature	DEPTH IN FATHOMS	Mean Fahrenheit temperature
100.....	60.7°	900.....	36.8°
200.....	50.1	1,000.....	36.5
300.....	44.7	1,100.....	36.1
400.....	41.8	1,200.....	35.8
500.....	40.1	1,300.....	35.6
600.....	39.0	1,400.....	35.4
700.....	38.1	1,500.....	35.3
800.....	37.3	2,200.....	35.2

While the mean daily variation of temperature in the surface waters of the open ocean is probably less than 1° F., the range from season to season may amount to 50° F. in those regions, like the oceanic areas around Japan, Newfoundland and the Cape of Good Hope, where the surface is occupied successively by waters of polar and of equatorial origin; but, on the other hand, there are very extensive regions both in the tropical and polar waters where the range does not exceed a few degrees during the course of the year. With descent into the depths, the seasonal changes in temperature tend rapidly to diminish.

The variation of the density of sea-water according to salinity and temperature is a prime factor in oceanic circulation. The mean density at successive depths is given in the following table:

DEPTH IN FATHOMS	Density	DEPTH IN FATHOMS	Density
Surface.....	1.0252	400.....	1.0273
100.....	1.0261	800.....	1.0276
200.....	1.0268	1,500.....	1.0279
300.....	1.0271	2,000.....	1.0280

The observed increases of density with increasing depth is chiefly attributable, down to 1,000 fathoms, to decrease of temperature but below that depth the continued rise in density

DEPTH	Pressure per square inch		
	Atmospheres	Pounds	Tons
33 feet.....	1	15	
66 ".....	2	30	
99 ".....	3	45	
100 fathoms.....	18	270	
500 ".....	90	1,350	
1,000 ".....	180	2,700	1.2
2,000 ".....	360	5,400	2.4
3,000 ".....	540	8,100	3.6
4,000 ".....	720	10,800	4.8
5,000 ".....	900	13,500	6.0
5,348 ".....	960	14,400	6.4

is due to a small increase of salinity which prevails in the greater depths of the ocean augmented by the compression to which the deep waters are subject under the weight of the

superincumbent mass since water is compressible by about one-twenty-thousandth of its bulk under the pressure of one atmosphere. Leaving out of account the pressure of the atmosphere upon the surface, for the pressure at successive depths in the ocean see the last table on preceding page.

The blue color of the ocean is owing to the selective absorption of light by sea-water, in which the blue rays are 10 times less absorbed than the red rays. There is light entering into the lesser depths of the ocean, but it is different from the familiar light of day on account of its deficiency in the rays from the red end of the solar spectrum. Recent observations conducted with photographic plates showed that, on a sunny day in the Sargasso Sea, there was sufficient light at a depth of 550 fathoms to affect a sensitive film after an exposure of 80

ing currents rise from the depths. These massive movements are in striking contrast with the rate of motion of the surface currents impelled, for the main part, in a clockwise circuit in each of the oceans of the northern hemisphere and in an anticlockwise circuit in each of the oceans of the Southern hemisphere, in general accord with the circuit of the prevailing winds, which, in their direct and indirect effects, taken in conjunction with the configuration of the continents, constitute the prime agency in originating and maintaining the circulation of the ocean.

The deposits which cover the bed of the ocean have been classified by Murray, according to their origin, into two grand divisions: terrigenous and pelagic. In the accompanying table these deposits are described and further subdivided into classes:

MARINE DEPOSITS

Littoral deposits between high and low-water marks.	{ Boulders, shingle, gravels, sands, muds, etc., derived from adjacent land.	
Shallow-water deposits, between low-water mark and 100 fathoms.	{ Sands, gravels, muds, marls, derived from adjacent land, shores, and shallow waters.	{ Terrigenous deposits formed in deep and shallow water close to land masses, from materials carried down from the land surfaces or torn away from the coast together with the remains of organisms which live on the bottom in shallow waters.
	{ Blue mud Red mud Green mud Volcanic mud Coral mud	
Deep-sea deposits beyond 100 fathoms.	{ Globigerina ooze Pteropod ooze Diatom ooze Radiolarian ooze Red clay	{ Pelagic deposits formed in deep water far removed from land, largely from the remains of calcareous and siliceous organisms which have lived in the surface waters and have fallen to the bottom after death.

minutes. Another plate was exposed for two hours at a depth of 900 fathoms without showing any effect. By employing filters for rays of different color, it was shown that, at a depth of 275 fathoms, many blue rays were present but scarcely any red ones, while at a depth of 55 fathoms all the component rays of sunlight were present, although there were fewer of the red than the others. The extent of the vegetable kingdom in the ocean is confined to this region of light-penetration or photic zone which must vary in its depth according to the zenith distance of the luminary and the nature of the materials held in suspension and solution in the water. The mantle of living matter which clothes the globe wherever water, air and earth commingle, while extending only a short depth into the crust of the earth and a short height into the atmosphere, extends throughout the whole depth of the ocean; but below the photic zone all of the numerous forms of living things which abound belong to the animal kingdom.

It has been pointed out that there exist in the ocean systematically varying distributions of salinity and of temperature, giving rise to a systematic distribution of the density or heaviness of the waters. This is one of the basic factors in oceanic circulation, causing a systematic descent from the surface of the heavier waters which characterize the polar borders of the temperate zones and a slow movement thence of the deeper waters, entirely distinct from the oscillations of the mass of the ocean set up by seiches and tides, both toward the equator and toward the poles, where ascend-

As yet knowledge is scanty in relation to the rate of deposition and the depth of marine deposits, since, in the operation of deep-sea sounding, the bottom soil has not usually been penetrated more than a few inches. It is very doubtful whether any analogues to the terrestrial rocks are to be found in connection with the pelagic deposits, from which there is a significant absence of quartz.

GEORGE W. LITTLEHALES,

Hydrographic Office, Washington, D. C.

OCEANUS, ō-sē'a-nūs, in Greek mythology, the oldest of the Titans, and a personification of the sea. He was called the son of Gæa (the earth) and of Uranus (heaven). Oceanus and Tethys were the parents of rivers and of the race of goddesses called Oceanids (q.v.). According to another account he was the father of all gods and men. The physical idea attached by the Greeks to the term Oceanus was that the earth was a flat circle surrounded by a river (Oceanus), out of which the sun and stars were supposed to rise and set, and on whose banks were the abodes of the dead. The term ocean was thus applied especially to the Atlantic, or sea beyond the Pillars of Hercules, in contradistinction to the Mediterranean or internal sea.

OCELLUS, a structure found in various groups of invertebrate animals, consisting of a spot of pigment enclosed in a capsule or cavity, generally supplied with nerve-filaments, and to which the function of sight is attributed. See EYE.

OCCELLUS LUCANUS, ō-sĕl'ŭs lŭ-kā'nŭs, a Pythagorean philosopher: b. Lucania, Italy, 5th century B.C. His works are 'On Law'; 'On Kingly Rule and Piety' and 'On the Nature of the Whole,' the last of which is the only one of his treatises now extant, excepting some fragments found in Stobæus, written in Doric. 'On the Nature of the Whole' is in Ionic, which fact leads some critics to doubt its authenticity. It is divided into four chapters, in which the author maintains that the whole, that is, Nature, the Universe, has no beginning nor end, and that men have always existed. He treats of the divisions of the universe, the heavens, the earth, the human race and the nature of time. Consult Mullach, 'Fragmenta Philosophorum Græcorum' (1860); Taylor, 'Ocellus Lucanus,' translated into English (1831).

OCELOT, ō'sĕ-lŏt, a tropical American wild-cat (*Felis pardalis*), averaging about two and one-half or three feet in length exclusive of the tail, and about 18 or 20 inches tall. Its body color is a variable and handsome fawn or grayish-brown, marked with lines of blackish ring-spots. The muzzle is somewhat long. The ocelot ranges northward as far as Louisiana, and is found in forests, where it preys largely upon birds. It is commonly seen in menageries, and in Mexico is often found in a semi-domesticated condition about farmhouses. It can climb trees with ease.

OCHAKOF, ō-chā'kŏf, or **OTCHAKOFF**, Russia, a town in the government of Cherson, on the Black Sea, at the mouth of the Dnieper, formerly an important Turkish fortress, with a citadel, the walls of which were 25 feet high. In 1737 it was stormed by the Russians, who lost 18,000 men in the attack. The Turks attempted to recover it with a force of 70,000 men, but were repulsed with the loss of 20,000. In 1738 it was given up by the Russians, who had previously destroyed the works. The Turks fortified it anew in 1743, and held it until 1788, when, after a siege of six months, it was stormed by Suvaroff, who razed it to the ground. By the peace of 1792 it was ceded to Russia. It has modern fortifications, and some coasting trade. Pop. 16,250.

ÖCHELHÄUSER-YUNKERS ENGINE. See INTERNAL COMBUSTION ENGINE.

OCHIL HILLS, Scotland, a mountain range on the borders of Perth, Clackmannan, Kinross and Fifeshire; average breadth, about 12 miles; highest summit, Bencluch, in the southwest, about 2,300 feet above sea-level. The Ochils are of basalt and greenstone, and contain copper and iron ores.

OCHINO, ō-kĕ'nō, **Bernardino**, Italian theologian and reformer: b. Siena, 1487; d. Schläkau, Moravia, 1564. He entered the Order of Observantine Friars, the sternest of the Franciscan orders, and in 1534 he had himself transferred to the still more strict Order of Capuchins, of which he was elected vicar-general in 1538 and in 1541. He evidenced leanings toward the Reformation as early as 1539, being convinced that salvation was not to be attained by ecclesiastical meditations, fasting and prayer. His sermons plainly indicated the change in his beliefs, but no movement was made against him until 1542, when the Inquisition was set up in

Rome, and Ochino was cited to appear. Realizing that either death or imprisonment was in store for him he decided upon flight and made his way to Geneva, where he joined Calvin. Here, within two years, he published six volumes of sermons explaining the change in his views upon religion. He was minister in charge of the Italian Protestant congregation at Augsburg in 1545-47, but was compelled to flee before the occupation of the city by the imperialist forces, and made his escape to England. There he became a prebendary of Canterbury, and received a pension from Edward VI. During this time he wrote 'A Tragedy or Dialogue of the Unjust usurped Primacy of the Bishop of Rome' (1549), a work of remarkable power, written originally in Latin, but translated into English by John Ponet, bishop of Winchester. The Latin version is lost, but the translation shows so striking a resemblance to Milton's 'Paradise Lost' that it is considered by many to be the inspiration of that work. The accession of Queen Mary in 1553 deprived him of his haven in England and he went to Zürich, where he became pastor of an Italian Protestant congregation. Here he was accused of favoring polygamy and doctrines derogatory to the Trinity, and neither his denial nor the record of his life served to secure him from banishment. He then went to Poland, but an edict against foreign heretics in 1564 forced him again to find a refuge. He settled in Moravia, and died soon afterward. He was bitterly criticized by the Protestants at the time of his death, but it has since been demonstrated that many of his doctrines were misrepresented and many forgeries foisted upon him. He expounded his faith in free will as against predestination in his 'Labyrinth' (c. 1562). His 'Thirty Dialogues' (1563) were misunderstood and deepened the troubles of his last years. Consult Benrath, B. O., 'B. Ochino von Siena' (1875; 2d ed., 1892; Eng. trans. by H. Zimmern, 1876).

OCHLOCKNEE, ōk-lŏk'nĕ', or **OCK-LOCKNEE**, or **OCKLOCKONEE**, a river of southeastern United States, about 150 miles in length, rising in Worth County, Ga., passing into Florida, between Leon and Gadsden counties, and flowing into the Gulf of Mexico through Apalachee Bay. It is too shallow for navigation, but is useful for rafting timber from the neighboring pine forests. Its banks also furnish a clay used in brick-making.

OCHRE, ō'kĕr, or **OCHER** (Greek, "yellow," "yellowish green," "pale"), friable clay with an admixture of iron oxides, giving it a color varying from yellow to red, as the iron peroxide is hydrate (yellow) or anhydrate (red). The reddish color may be deepened artificially by burning. Rarely manganese takes the place of iron in the composition of ochre, or occurs in addition to iron, the brownish variety thus formed being called "Sienna" (from its famous source in Italy) or "umber" (Latin, *umbra*, "shade"). Ochre is used largely in the production of paints. The coloring of these two shades again is deepened by their being burnt. UMBER and sienna are largely found, outside of Italy, in New York, Pennsylvania, Missouri and Tennessee; and the leading States in the production of ochre are Pennsylvania, Georgia, California and Vermont. But the United States

produces less ochre and iron oxide pigments than France or Germany. Until recently the home product was inferior to the foreign, being only 50 per cent pure, a fault now remedied by specially designed crucible furnaces, which ensure the purity of the increased output. The best yellow ochre is that coming from Oxford, England. See LIMONITE; HEMATITE.

OCHRO, same as Okra (q.v.).

OCHS, öks, **Adolph S.**, American publisher: b. Cincinnati, Ohio, 12 March 1858. His early life was that of a country lad, and he obtained a common school education at Knoxville, Tenn., where for a year he served as carrier and newsboy. In 1871 he was grocer's clerk at Providence, R. I., attending a night school meanwhile. He then returned to Knoxville, where he was a druggist's apprentice for a year. Later he learned the printing trade, and in 1876 he became assistant to the foreman in the composing room of the *Knoxville Tribune*. In 1877 he joined the staff of the *Chattanooga Dispatch* and became its editor-in-chief. In 1878 he acquired a half interest in the *Chattanooga Times*, which he developed into a leading newspaper of that State. Incidentally, he established *The Tradesman*, which is familiar to Southern business men, in which periodical he still owns a large interest. He also established the *Southern Associated Press* and became its president. In 1896 Mr. Ochs became publisher and controlling owner in the *New York Times*. In 1901 he purchased the *Philadelphia Times*, which was managed by his brother, George Washington Ochs. The next year he paid more than \$2,500,000 for the *Philadelphia Public Ledger*, and the two papers were consolidated. Just, considerate, resourceful, enlightened of view, undaunted by difficulties and unspoiled by success, preferring always the straight and open way to the path of indirection, as mindful of public responsibility as private duty, loyal to principle even at the cost of present advantage, one of the best and highest examples of the commercial publisher, Mr. Ochs is a recognized force of international importance.

OCHS, George Washington, American journalist, brother of Adolph S. Ochs (q.v.): b. Cincinnati, 27 Oct. 1861. He was graduated at the University of Tennessee in 1879. He was mayor of Chattanooga, Tenn., in 1894-95 and in 1896-97. He published the Paris edition of the *New York Times* at the Paris Exposition in 1900; and in 1901-02 he was general manager of the *Philadelphia Times*. He was editor of the *Philadelphia Ledger* in 1902-15, since when he has edited the *Current History Magazine* and the *New York Times' Mid-Week Pictorial*. He is a Chevalier of the French Legion of Honor.

OCHSNER, öks'nēr, **Albert John**, American surgeon: b. Baraboo, Wis., 3 April 1858. He was graduated from the University of Wisconsin in 1884, took his M.D. at the Rush Medical College, Chicago, in 1886, and later studied medicine at Vienna and Berlin. He has been engaged in practice at Chicago since 1889 and has served as chief surgeon of Augustana and Saint Mary's hospitals since 1896. He has been professor of clinical surgery at the College of Physicians and Surgeons, Chicago, since 1900, and in 1908 was appointed first lieu-

tenant in the United States Army Medical Reserve Corps, becoming major in 1916. Author of 'Handbook on Appendicitis' (2d ed., 1906); 'Clinical Surgery for the Instruction of Practitioners and Students' (2d ed., 1905); 'Organization, Management and Construction of Hospitals' (1907); 'Year Book of Surgery' (1917-18); 'Treatise on Surgical Diagnosis and Treatment' (1918), etc.

UCHTERLONY, ök-tēr-lō'nī, **Str David**, British general and administrator: b. Boston, Mass., 12 Feb. 1758; d. Meerut, near Delhi, 15 July 1825. He went to India as a cadet in the Bengal army of the East India Company in 1777, was appointed resident at Delhi in 1803, was promoted major-general in 1804 and in that year successfully defended Delhi against Holkar. He prevented the advance of the Sikhs in 1808. He conquered Nepal in the War of 1814-15, received a baronetcy for his service and in 1816 concluded the final peace treaties of the British with Nepal. He brought the Pindari War of 1817-18 to a successful termination with little bloodshed, and in 1818 was appointed British resident in Rajputana and afterward became British resident of Central India, performing excellent service in pacifying and building up the country. In 1825 he supported Balwant Singh, the infant Rajah of Bharatpur, against the insurrection headed by his cousin, Durjan Sal, but his action was disapproved by the governor-general, Lord Amherst, and he was ordered to withdraw his support. Ochterlony promptly resigned and died soon afterward. His successor, Metcalfe, supported his policy and forced Lord Amherst to yield, although the delayed action necessitated the employment of 20,000 men for the work Ochterlony had well in hand without outside assistance.

OCHTMAN, ökt'man, **Leonard**, artist: b. Zonnemaire, Zeeland, Holland, 21 Oct. 1854. He settled in Albany with his family in 1866 and became a draughtsman in an engraving office; had a studio at Albany for two years and subsequently took a winter course at the Art Students' League, New York. As a landscape painter he is self-taught, but traveled through England, France and Holland for the purpose of study. His power and skill are shown in such paintings as 'Night on the Mianus River'; 'Autumn Moonlight'; 'Moonlight Night in Spring'; 'A Morning Symphony.' Vivid color, depth of imagination and breadth of treatment characterize his paintings whose truthfulness reveals a genuine love of nature in their author. He is a member and official of the leading art societies and has been the recipient of numerous silver and gold medals and other awards and honors.

OCIMUM, a genus of plants. See BASIL.

OCKERSON, ök'ēr-sōn, **John Augustus**, American civil engineer: b. Skane, Sweden, 4 March 1848. He came to the United States in 1851 and was graduated from the University of Illinois in 1873. He served in the Union army in the Civil War; in 1871-79 assisted in the survey of the Great Lakes, and in 1876 was United States assistant engineer at Eads Junction. He was engaged in the survey of the Mississippi River in 1879-87. He was employed as a mining engineer in 1888-98, and since 1898

has been a member of the Mississippi River Commission. He was consulting engineer of the chief department of Liberal Arts at the Saint Louis Exposition in 1904, and a member of the International Jury of Awards at the Paris Exposition in 1900. He was a delegate to the International Congress of Navigation in 1900, 1905, 1908 and 1912, and to the Congress of the Merchant Marine at Paris. He has been decorated by the governments of France, Italy, Sweden, Germany, Belgium and China and is a contributor to scientific journals on topographical and engineering subjects.

OCMULGEE, òk-mŭl'gē, a river in Georgia which rises north of the central part of the State, flows south, southwest and east, uniting with the Oconee to form the Altamaha. It passes through an agricultural region; its length is about 260 miles. The upper course has many rapids and small cascades, and the lower course is through a more flat country, covered with pine forests. It is navigable for small steamers for about half its distance from the mouth to Macon.

OCONEE, ò-kō'nē, a river in Georgia which rises in Hall County, flows southeast and unites with the Ocmulgee to form the Altamaha. It is navigable for about 100 miles from its mouth.

O'CONNELL, ò-kōn'ēl, Daniel, Irish patriot: b. Cahir, County Kerry, Ireland, 6 Aug. 1775; d. Genoa, Italy, 15 May 1847. He studied in France at the colleges of Saint Omer and Douay, and in 1793, on his return home, began the study of law. In 1798 he was admitted to the bar, and soon began to distinguish himself both by legal skill and oratory. After a speech made at Dublin in the beginning of 1800, at a meeting held to petition against the union, he was regarded as one of the most promising and energetic of the younger Catholic leaders. The question of Catholic emancipation being seriously agitated, he was active in every attempt to remove the national grievances, and he was a tireless member of the various Catholic societies and unions formed for the purpose of procuring the repeal of the laws placing civil disabilities on Catholics; in 1824 he founded the "Catholic Association" which carried on active agitation in spite of government measures against it and succeeded in creating a general sentiment in favor of Catholic emancipation. The chief grievance was that Catholics could not sit in Parliament without taking an oath contrary to conscience. In 1828 O'Connell took a decisive step by becoming candidate for Parliament in the county of Clare. He was elected but could not take his seat because he refused to take the preliminary oath. His election, however, was a fact that could not be ignored, and as the feeling in favor of emancipation continually increased, the ministry with the Duke of Wellington at its head decided they must concede it. In 1829 therefore the Catholic Emancipation Bill was passed, and under its provisions O'Connell took his seat, and became the leader of the Irish party in the House of Commons where he continued to represent Clare until his death. While carrying on this agitation, he was for many years the annual recipient of a large sum contributed by his Catholic countrymen who idolized him as their liberator. In 1842

he began the agitation for the repeal of the union between Great Britain and Ireland, and the disestablishment of the Anglican church, holding monster meetings at which he was the chief speaker. In 1843, arrested on a charge of conspiracy and sedition, he was convicted and sentenced to fine and imprisonment; but the House of Lords reversed the judgment on 4 Sept. 1844. He then resumed his seat in Parliament, but his influence was lessening as a new Irish party had risen—called Young Ireland—which advocated more radical measures, and did not favor O'Connell's "moral force" policy. In 1846 he supported the Whig ministry which still further alienated him from the younger party. His health was failing, and in 1847 he went to Italy, intending to visit Rome, but he died at Genoa.

J., 'Correspondence of Daniel O'Connell' (London 1888); Lecky, W. E. H., 'Leaders of Public Opinion in Ireland' (New York 1903); MacDonough, Michael, 'Life of Daniel O'Connell' (Saint Louis 1905); McCarthy, Justin, 'History of Our Own Times'; O'Connell (his son), 'Life and Times of Daniel O'Connell' (1846); Phillips, Wendell, 'Daniel O'Connell.'

O'CONNELL, William Henry, American cardinal: b. Lowell, Mass., 8 Dec. 1859. He was graduated from Boston College A.B. 1881, and studied theology at the North American College, Rome, Italy, 1881-84. He was ordained priest at Rome, 8 June 1884 and was appointed rector of the North American College, 21 Nov. 1895. He was named a domestic prelate in 1897, and on 22 April 1901 was appointed bishop of Portland, Me. He was consecrated at Saint John Lateran, Rome, 19 May 1901, and returning to the United States he at once entered upon the duties of his diocese, having been installed in the cathedral at Portland, Me. He was honored with the title of assistant at the Pontifical Throne in January 1905, and was a special papal envoy to the Emperor of Japan in 1905, at which time he was presented with the Grand Cordon of the Sacred Treasure by the Mikado of Japan. He was elevated to the archbishopric and named coadjutor to Bishop Williams of Boston, Mass., on 8 Feb. 1906, his title being archbishop of Constance, and on the death of Bishop Williams he succeeded to the see of Boston, 30 Aug. 1907. He was created cardinal by Pope Pius X, 30 Nov. 1911. By this time he was already looked upon as one of the most influential Catholics in the United States. His published works consist of sermons and addresses.

O'CONNOR, ò-kōn'ôr, Andrew, American sculptor: b. Worcester, Mass., 7 June 1874. He was from childhood the pupil of his father, to whom he owes the greater share of his education as an artist. He works in both marble and bronze and is noted for his statues and bas-reliefs. He received the second medal at the Paris Salon in 1906, the highest award ever given a foreign sculptor at that institution. Among his works may be mentioned the central porch at Saint Bartholomew's Church, New York; 11 marble statues at the Essex County courthouse, Newark, N. J.; a bas-relief in the

library of J. P. Morgan, New York; the General Liscom monument, Arlington; the General Thomas monument, Tarrytown; a bronze statue of Gen. Lew Wallace at the Capitol, Washington, and a marble statue of him at Crawfordsville, Ind.; the monument to Gen. John A. Johnson, Saint Paul; the original model of the statue of Commodore Barry at the Luxembourg Museum; and the original design of the bronze doors at Saint Bartholomew's, and a marble portrait of Edward Tuck, also in the Luxembourg Museum; a statue of Lincoln at Springfield, Ill., etc. In April 1919 Mr. O'Connor was chosen associate of the National Academy of Design.

O'CONNOR, Arthur, Irish political leader: b. Mitchelstown, County Cork, Ireland, 1763; d. near Nemours, France, 25 April 1852. He was admitted to the bar in 1788, was elected to the Irish Parliament and as a member of the United Irishmen served as one of their directory of five, in consequence of which he was tried for high treason, but finally discharged. He then became editor of *The Press*, the society organ. He went to France and on his return to Ireland was again arrested, and kept in prison until 1803 when he made his escape and entered the service of Napoleon, who made him a lieutenant-general in 1804 and later general of division. He married the daughter of Condorcet and became a French subject in 1818. He published 'Letters to Earl Camden' (1798); 'The Actual State of Great Britain' (1804); 'A Speech on the Catholic Question' (1795); 'Monopoly, the Cause of All Evil' (1848).

O'CONNOR, John, Canadian jurist: b. Boston, Mass., January 1824; d. Coburg, Ontario, 3 Nov. 1887. He removed with his parents to Canada in 1828 where he was educated, and in 1854 admitted to the bar. He sat for Essex in the Canadian Parliament 1867-72, and in the last-named year was president of the council in Sir John Macdonald's administration. Later he was Minister of Inland Revenue and Postmaster-General, and became queen's counsel in 1873. In 1878 he was reappointed president of the council and in 1880 became a second time Postmaster-General, was Secretary of State for a time, and in 1881 reassumed the office of Postmaster-General. He was a commissioner for revising the statutes of Canada and Ontario, and in 1884 was appointed judge of the High Court of Justice of Ontario.

O'CONNOR, John Joseph, American Roman Catholic bishop: b. Newark, N. J., 11 June 1855. He was educated at Seton Hall College, in the American College at Rome, at Louvain and in 1877 he was ordained to the priesthood. Professor of philosophy and theology, Seton Hall College and Seminary, 1878-95; pastor Saint Joseph's Church, Newark, 1895-1901; consecrated bishop of Newark, N. J., 25 July 1901.

O'CONNOR, Roderic, or **Rory**, king of Ireland, son of Turlough O'Connor, king of Connaught: b. 1116; d. Abbey of Cong, County Mayo, 1198. He succeeded to the throne of Connaught on the death of his father in 1156, made war against the O'Brians, O'Lochlinns and others and in 1166 was inaugurated king of all Ireland at Dublin. When Henry II

visited Ireland in 1171 after the Norman invasion Roderic did not make submission to him; but in 1175 a treaty was concluded by which Roderic was to continue to rule Connaught, and was to be head of the kings and chiefs of Ireland under the sovereignty of Henry II, whom Roderic acknowledged as his liege lord. His son Chonchobhar, allied with the English, invaded Connaught in 1186 and drove Roderic into Munster. Later he was permitted to return but was deprived of his throne. He was again king for a short time after the death of his son in 1189, but was deposed by Cathal O'Connor. He retired to a monastery, where he died. Consult Orpen, G. H., 'Ireland Under the Normans' (2 vols., 1911).

O'CONNOR, Thomas Power, Irish journalist and politician: b. Athlone, 5 Oct. 1848. Educated at Queens College, Galway, he entered journalism in Dublin, went to London in 1870 and was for a time in the London office of the *New York Herald*. He entered Parliament for Galway in 1880, and represented the Scotland division of Liverpool in 1885. He founded and edited *The Star*, 1888-90, *The Sun* and the *Weekly Sun*, and later became editor of *M. A. P.* (Mainly About People). He early became one of the most active members of the Parnell party. In 1881 he made a tour of the United States and lectured on the Irish cause to large audiences. In 1906 and again in 1917 he visited the United States on other lecture tours. In 1883 he had become president of the Irish National League of Great Britain. His works include a biography of Beaconsfield (1883); 'Gladstone's House of Commons' (1885); 'The Parnell Movement' (1886); 'Gladstone, Parnell and the Great Irish Struggle' (1886); 'Sketches in the House' (1893); 'Napoleon' (1896); 'The Phantom Millions' (1902); 'The Story of the Great French Fraud' (1902); 'Sir Henry Campbell-Bannerman' (1904); 'Some Old Love Stories'; and very many magazine and newspaper articles.

OCONOMOWOC, ò-kôn'ô-mô-wôk, Wis., city in Waukesha County, on the Chicago, Milwaukee and Saint Paul Railroad, about 33 miles west by north of Milwaukee. It is in the midst of a region of beautiful lakes, the largest of which are La Belle and Fowler, and it is noted for the good fishing in the vicinity. Fertile farm lands are in this part of the State, and the industries of the city are connected chiefly with farm and dairy products. The city owns and operates the electric-light plant and the waterworks. Pop. 3,301.

O'CONOR, ò-kôn'ôr, Charles, American lawyer and politician: b. New York, 22 Jan. 1804; d. Nantucket, Mass., 9 Feb. 1884. He studied law, was admitted to the bar at 20 and soon became one of the leading lawyers of the country; the Forrest divorce suit, the Slave Jack case (1835), the Lispenard will case (1843) and the Jumel case (1871) were the most important litigations he took part in before the great Tweed suits in which he acted for the prosecution with William M. Evarts and W. H. Peckham. O'Conor wrote 'Peculation Triumphant,' a record of the Tweed ring. A Southern sympathizer during the war, he went bail for Jefferson Davis together with Horace Greeley. In 1872 he was nominated for the Presidency

by the wing of the Democracy opposed to the nomination of Horace Greeley; he refused the nomination, but polled nearly 30,000 votes. In 1876 O'Connor acted as counsel for Samuel J. Tilden before the Electoral Commission.

O'CONNOR, John Francis Xavier, educator: b. New York City, 1 Aug. 1852. A.B. Saint Francis Xavier College, New York; English studies in London; philosophy in Louvain (three years); theology in Woodstock (four years); Oriental studies at Johns Hopkins, and Lyons of Harvard. Became member of Society of Jesus in 1872; ordained priest 1885. Professor of philosophy and rhetoric at College of Saint Francis Xavier; at Georgetown University; Fordham University; Saint Joseph's College, Philadelphia; president and founder of Brooklyn College; founder of Brooklyn Alumni Sodality; Saint Joseph's Alumni Sodality of Philadelphia; Alumni Association of Saint Ignatius School. Preacher; lecturer on Christian art; on Greek art; on the Wagner operas. Lecturer on cuneiform inscriptions before any schools on it were established in United States. Author of 'Babylonian Inscriptions'; and translator of first Babylonian inscriptions published in English in America. Member of Oriental Congress of Vienna. Author of Oriental articles in 'Hebraica.' Author of 'Reading and the Mind' (7th ed., 1907); 'Christian Art' (1885); 'Cuneiform Inscription of Nebuchadnezzar' (1885); 'Three Holy Lives' (1887); 'Pearls of a Year' (1887); 'Life of Saint Aloysius' (1892); 'Practice of Humility' (1890); 'Sacred Scenes and Mysteries' (1898); 'Facts about Bookworms' (1898); 'Rhetoric and Oratory' (1898); 'Education in the Schools of New York' (1901); 'Dante, a Drama'; 'Prayer, that wins'; short stories, music, poems, plays, articles; 'A Study of Francis Thompson's Hound of Heaven' (7th ed., 1914); 'Every soul, Mystical Opera' (5th ed., 1915); 'Sunshine Through the Clouds' (1916); 'Selected Verse' (1916); 'The Crusade of Children' (1916); 'A Spiritual Retreat' (1916). Member of 19th International Congress of Americanists in Washington 1915, and official delegate of Georgetown University, presenting valuable ethnological and historical paper on Early Indians in the United States and their missions; composer of 'Dear Lord' and 'Jesus the All Beautiful' sung through the United States; 'America's National Anthem,' author and composer of words and music.

OCONOSTÓTA (Aganasata, "groundhog"), a Cherokee Indian chief: b. about 1708; d. 1810. He was one of a delegation of 32 chiefs who waited on Governor Littleton of South Carolina with the object of finding a peaceful solution to the troubles that threatened to bring on a long and bloody war between the Indians and the English. In 1760 Littleton ordered all these delegates thrown into prison. After a while, when the governor thought he had impressed the Indian chiefs with the power of the English government, Oconostóta and two other young chiefs were set at liberty and sent home to inform the Cherokees that nothing but unconditional submission on their part would be considered by him as the representative of the British government. As soon as he got back home Oconostóta took command of the Cherokees, organized a large war party and laid siege to the post. He paid back the English

governor's bad faith in coin, by inviting the commander to a peace conference and shooting him. In return the English shot the chiefs still in their power (February 1760). In June of the same year Colonel Montgomery invaded the land of the Cherokees. At first he met with considerable success; but he was finally defeated by the Indians at Nikwasi (near Franklin, N. C.) with heavy loss. Less than two months later Oconostóta captured Fort Loudon. The following year Colonel Grant, with a force of 2,600 men, laid waste the Cherokee country and destroyed their villages and crops. The Indians, though undefeated, suffered so much from hunger and other privations that they finally concluded a treaty of peace with the British. From that time on Oconostóta was the faithful ally of the British. In 1768 he signed a treaty of peace with the Iroquois who had been his lifelong enemies. He took no active part in the Revolutionary War, being infirm and a semi-invalid. He resigned his chiefship in 1782 in favor of his son. See **CHEROKEES**.

OCONTO, ō-kōn'tō, Wis., city, county-seat of Oconto County, at the mouth of the Oconto River, on Green Bay, and on the Chicago, Milwaukee and Saint Paul and the Chicago and Northwestern railroads, about 30 miles north by east of the city of Green Bay. It was settled in 1850 and in 1882 was incorporated. It is in an agricultural and lumber region and has considerable trade in farm and dairy products, fish and lumber. Its chief industrial establishments are flour and lumber mills, canneries, creameries, a brewery and a wagon factory. It has a good public library, a high school, courthouse and a number of fine residences. Pop. (1920) 4,920.

OCOTE, ō-kō'tā, a very resinous pine tree of parts of Mexico and Central America. It makes excellent lumber for flooring and all kinds of carpenter uses, but it is difficult to work on account of its hardness and the quantity of gum which it contains. The trees, which grow to a fair size, are highly aromatic. On account of the great amount of resinous matter contained in the ocote it was used extensively at the time of the discovery of America for torches by the natives of Mexico; and it is still put to the same use in the more remote mountainous districts of the country. Much of it is turned into charcoal, which is sold throughout the towns and villages of the greater part of the republic, where very often it furnishes the only fuel used. The lamp-black obtained from the ocote, which is called *humo de ocote* (smoke of ocote) is used for the basis of an excellent black paint and, mixed with water color preparations, is employed extensively for painting and decorating houses and buildings of all sorts.

OCOTEA, a genus of tropical trees of the mountain-laurel family (*Lauraceae*, q.v.), the wood of which is strongly and usually disagreeably scented. Prominent species are the stinkwood (*O. bullata*) of the Cape of Good Hope; til-wood (*O. fatens*) of Madagascar, and the cinnamon-yielding *O. cupularis* of Mauritius. Some of these trees yield valuable timber. See **STINKWOOD**.

OCRACOCKE (ō'krā-kōk) **INLET**, on the coast of North Carolina, between the islands of Portsmouth and Ocracoke, and forming a

passage from the Atlantic into Pamlico Sound. Just at the western end of the inlet is a light-house, and on each side are dangerous shoals. Cape Hatteras is about 20 miles northwest.

OCTAGON, in *geometry*, a polygon of eight angles or sides. A regular octagon is an octagon all of whose sides and angles are respectively equal to each other. See *GEOMETRY*.

OCTAHEDRITE, dioxide of titanium in the crystal form, so called because of its tetragonal crystallization; sometimes styled *Anatase*. Its chemical composition (Ti_2O_3) is that of the amorphous rutile and Brookite. Octahedrite is yellow, brown, gray, blue or black; has a quasi-metallic lustre; is unaffected by acids and infusible with blowpipe; becomes incandescent if gradually heated; has a density of 3.83 to 3.93; and a hardness of 5.5. It occurs in the granite fissures of Switzerland, of Dauphiné at Bourg d'Oisans (whence the French name *Oisanite*), of the Brazilian diamond fields, and in the United States in Burke County, N. C., and Smithfield, R. I.

OCTAHEDRON, in *geometry*, a solid contained by eight faces. The regular octahedron has as faces equilateral triangles. It has 12 edges and six corners, and is reciprocal to the cube, which has eight triedral angles as vertices, 12 edges and six faces. See *GEOMETRY*.

OCTANS, the "Octant," in *astronomy*, the constellation surrounding and including the South Pole of the heavens, and one of the 14 added to the heavens by Lacaille in connection with his work at the Cape of Good Hope.

OCTAVE, the eighth day after a festival, and the intervening days, all of which partake of the nature of the festival. In the Roman Catholic Church octaves are privileged and non-privileged, with many degrees and subdivisions of the former. The octaves of Easter and Pentecost are specially privileged. In the octave of Epiphany only the feast of patron saint, title or dedication of a church may be kept, and that not on the eighth or octave day, on which the services of the festival are to be repeated. In the Church of England the only festivals mentioned as having octaves are Christmas Day, Easter Day, Ascension and Whitsunday. Dr. Sparrow, in the 'Rationale,' says that our whole life being spent in the revolution of seven days, the eighth or octave signifies eternity. On the other hand Du Cange declares that the eighth day denotes a finished solemnity, inasmuch as our Lord's resurrection took place on the eighth day, counting the period of his Passion as beginning on one Sunday, when he entered Jerusalem in triumph, and ending on the next, when he rose in triumph from the grave.

OCTAVE IN MUSIC, the interval between any musical note and its most perfect concord of which it is half the pitch. See *HARMONY*.

OCTAVIA, Roman matron, wife of Mark Antony, the triumvir, and sister of Octavian, or Augustus: d. 11 B.C. She was married (before 54 B.C.) to Gaius Claudius Marcellus, who became consul in 50 B.C. Julius Cæsar, her great uncle, wished to divorce her from Marcellus so that Pompey might marry her and thus be as closely bound to him as he had been during the life of Julia, his first wife and

Cæsar's daughter; but Pompey and Marcellus both objected. After Marcellus' death in 41, however, she was married to Mark Antony, thus cementing the bond between him and her brother Octavian, the future Augustus. Antony's passion for Cleopatra and his complete enslavement to her, in spite of the remarkable beauty and matchless virtue of Octavia, had much to do with precipitating the war between Antony and Octavian. She was actually divorced by Antony in 32 B.C., but cared tenderly for her children after his death. Her son by Marcellus was Marcus Marcellus, adopted by Augustus as his heir. He died prematurely in 23 B.C. bitterly bewailed by his mother and pathetically sung by Virgil in the sixth *Æneid*. Her daughters by Antonius became, respectively, the grandmother of Nero, and the mother of Caligula. The porticus Octaviæ, built in her honor by Augustus, enclosed the temples of Jupiter Stator and Juno. Consult Abbott, F. F., 'Society and Politics in Ancient Rome' (New York 1909).

OCTAVIA, Roman empress, wife of the Roman emperor Nero (q.v.): b. 42 A.D.; d. Pandataria, 62 A.D. A daughter of the emperor Claudius and of Messalina (thus a granddaughter of Octavia, the wife of Antony), she married in 53 her cousin, Nero, then only 16. He was soon unfaithful to her, first leaving her for Acte, a freedwoman, and then for Poppæa Sabina, whom he married in 62, only 16 days after his divorce from Octavia. But Octavia's popularity was so great that Nero was forced to recall her to Rome, where she was so enthusiastically received as to rouse the jealousy of Poppæa. She was exiled to Pandataria on a false charge of infidelity and was there killed by Nero's emissaries. A tragedy, telling her story and bearing her name, was long attributed to Seneca; its author may have been Cruriatus Maternus, but it is still printed among Seneca's plays. Consult Butler, H. E., 'Post-Augustan Poetry' (Oxford 1909); Chickering, E. C., 'An Introduction to Octavia Prætexta' (New York 1910); Teuffel, W. S., 'Geschichte der römischen Litteratur' (Vol. II, Leipzig 1910).

OCTAVIANUS, or **OCTAVIAN**. See *AUGUSTUS*.

OCTOBRISTS, or **OCTOBERISTS** ("the Party of the 17th of October"), a Russian conservative political party formed by the moderates after the Tsar's manifesto of 17 Oct. 1905, in which he guaranteed to Russia a liberal constitution. They supported the program of Count Witte, advocating an extension of suffrage and a reorganization of the Duma. The Duma already formed was to become a lower house, the Imperial Council to constitute one-half the members of the upper house, while the remaining members were to be elected. They were in the minority in the second Duma; but in the third, through changes in the representation from the more distant provinces and by placing a property restriction on suffrage in other districts, the Octobrists became the Centre of the house. By this time, however, the party as originally conceived had practically disappeared, the remaining members supporting monarchical ideals, so that on the whole they were regarded as reactionaries. They maintained support of the government at the outbreak of the European War in 1914.

DECAPODS AND OCTOPODS

OCTOIC ACID, or **CAPRYLIC ACID**, an organic acid having the chemical formula $C_8H_{16}O_2$, or $C_8H_{15}CO.OH$, and occurring, in the form of a glyceryl ether, in common butter and, also, in much larger quantities, in coconut oil. It may be obtained in the form of white crystals, which melt at $63^\circ F$. Octoic acid is almost insoluble in cold water, but dissolves in boiling water. Various isomers and compounds of the acid are known, but none are of any commercial importance.

OCTOPODA, the eight-armed cephalopods. See **CEPHALOPODA**; **OCTOPUS**.

OCTOPUS, a genus of the dibranchiate *Cephalopoda* (q.v.), or cuttlefishes, forming the type of the family *Octopodidæ*, the members of which group are familiarly known as "poulpes." These forms possess eight arms of equal length, united to each other by a web varying in extent in different forms. The arms possess two rows of sessile, wholly fleshy suckers. The prominent head is joined to the body by a distinct "neck," and the body itself is short, generally more or less rounded in shape and unprovided with side or lateral fins. The shell is internal, and is represented by two short "styles," which lie imbedded in the "mantle." In the octopods the third right arm of the male animals becomes developed to form a "hectocotylus" or sexual organ (see **ARGONAUT**); and in some this modified arm is detached from the body and deposited within the mantle cavity of the female for the purpose of fertilizing the eggs, a fresh arm being developed as occasion requires.

The poulpes attained a popular notoriety from the tales which were formerly circulated of gigantic members of this group which had no existence in reality. Some forms spread their limbs 12 or 14 feet, like great spiders, and might, under favorable circumstances, hold under water a person whom they had seized until he had drowned, at the same time biting him with their horny parrot-like jaws; no doubt such accidents have occasionally happened to pearl-divers and the like. Ordinarily, however, the octopus does not attain one-half these dimensions and many species have bodies no larger than an ordinary pear. These animals live in rocky places along shore and about reefs, protecting their soft bodies by sitting in holes and crevices with arms reaching out to seize their victims, which are fishes and any animal they are able to overpower. They are themselves preyed upon by large fishes, turtles, etc. Many species are eaten in various parts of the world and the common one (*Octopus vulgaris*), of the Mediterranean and neighboring Atlantic coasts, has been speared and taken to market from a time immemorial, and is still a regular object of pursuit, especially in Italy. A deep-water species (*Eledone moschata*) is trapped for market in from 10 to 20 fathoms of water by lowering earthen jars and leaving them a few hours. The creatures creep into these jars, as a fine hiding-place, and allow themselves to be drawn to the surface. The flesh is eaten boiled, fried and in salads and is preserved by pickling. Sepia (q.v.) is the substance in the "ink-bag"; and "cuttlebone" the supporting calcareous plate beneath the skin of certain species. Of the American species *O. bairdii* and others of the eastern coast dwell in deep water or about the tropical

coral reefs. On the Pacific Coast several species are taken near shore and were always utilized by the Indians. Since the settlement of California their flesh is regularly supplied to the San Francisco market, where it is bought by Italians and Chinese. Some specimens brought in there are among the largest known, measuring 14 feet across the outstretched arms. Consult books of conchology, especially Cooke, 'Mollusca' (1895); and 'Standard Natural History' (Vol. I, 1884). See **ARGONAUT**; **CEPHALOPODA**; **CUTTLEFISH**.

OCTOPUS, The, a novel by Frank Norris, published in 1901. It was the intention of its author to write a trilogy of novels which should symbolize American life as a whole, with its hopes, aspirations, possibilities and problems. This book, which is the first of the three, has for its central motive Wheat, the great source of American power and prosperity, and also the literal staff of life. 'The Pit,' the second of the proposed trilogy, appeared in 1902, not far from the time of the author's death.

OCTOSTYLE, a term in architecture applied to a temple or portico having eight columns in front. The most perfect example was the Parthenon at Athens, a building of the Doric order. Few remains of Greek buildings of this style exist, the common practice having been to construct temples of the hexastyle or six-column order. Another notable example of the octostyle is the portico of the Pantheon at Rome.

OCTROI, ok-trwa, an old French term particularly applied to the commercial privileges granted to a person or to a company. In a like sense the term is applied to the constitution of a state granted by a prince in contradistinction to those which are derived from a compact between the ruler and the representatives of the people. The tax was levied on articles of food brought into a city or town. A great deal of the money for the expenses of the local town government in France is obtained from the Octroi, nine-tenths of which are applied to local uses and one-tenth to the national treasury. Under the name "Alcabala" a similar tax was collected in Spain and the Spanish colonies. This tax was in force in Mexico until a few years before the revolution of 1910.

OCUBA-WAX, a vegetable wax obtained from the fruit of a nutmeg (*Myristica ocuba*), growing abundantly in the marshy grounds on the shores of the Amazon and its tributaries. It is easily bleached, and is used extensively in Brazil for the manufacture of candles.

O'CURRY, ô-kûr'î, Eugene, Irish scholar: b. Dunaha, County Clare, 1796; d. Dublin, July 1862. He was son of a rather gifted farmer. Though lame he worked on the farm until 1834. He was for three years employed on the *Ordnance Survey*; and after several years spent in copying Gaelic manuscripts and writing translations for the Royal Irish Academy, Trinity College (Dublin), the British Museum and other learned institutions, he was called, in 1855, by John Henry Newman to the chair of Irish history and archæology in the Catholic University of Ireland, then just founded. There he displayed a wonderful knowledge of all the sources of Irish history,
